The Temple of Belus.

FROM the earliest days of the study of archæology, the great Temple of Belus, or Bel Merodach, the chief god of the Babylonian Pantheon, was a wonder of the world. The Greek travellers, historians, and geographers have written upon it, as have most modern travellers and explorers. But now, when the descriptions afforded us by the Babylonian scribes can be consulted, we may hope to gain a truer knowledge of this great national fane of the Babylonians. The temple was called the Temple of "Bit Saggal," or the "House of the exalted Summit," its name being derived from the great stage tower which formed its centre. It was restored by nearly every Babylonian and by a great number of Assyrian kings, and from these records we have been able to gather some interesting details regarding the edifice and the arrangement of its component parts. The principal inscriptions which have been consulted in order to gather the necessary details are, the tablet copied by Mr. Smith, and a notice of which was first published by him in 1876; this gives the measurements of the principal courts and edifices. Other inscriptions are the cylinders of Esarhaddon, Assurbanipal, kings of Assyria; and the India Museum inscription and cylinders of Nebuchadnezzar. From these, together with numerous small inscriptions and tablets, we have been able to gather the account of the main features of the building. The very faithful descriptions of the temple given by Herodotus have also been found of great aid, but those of Strabo and Diodorus must be rejected as fictions.

An inscription, of which unfortunately we possess only a copy made by the late George Smith, the original having been lost, furnishes us with a very large number of details and measurements of the great Babylonian temple. This temple was to Babylon what the great temple at Jerusalem was to that city, and, together with the royal palace, which was close adjacent to it, formed the acropolis of the city.

Herodotus, who visited Babylon when under the Persian rule, in the fifth century before the Christian era, has preserved a very accurate description of the main features of the great temple and the surrounding buildings, and his account meets with very great confirmation from the above inscription. We have in our former article dealing with the land laws and system of land survey in use in Babylonia,* given some account of the system of measures in use. But as the details of this work are expressed in a fuller scale of notation, it may lead to a better understanding of the matter if a short space is devoted to the explanation of the Babylonian numerical system.

A double or compound system of notation was in use among the mathematicians of Babylonia, being a fusion of the decimal and the sexigesimal, or a scale having for its units the numbers 10 and 60. The scale consisted of the following summations,—the unit 1, the sos or 60, the *ner* 60 × 10 = 600, and the sar or sarros = 60^2 = 3,600. With this series the Babylonian managed to carry out most extensive mathematical calculations.

In the measures employed we have the cubit, and the gar, with the uban or Babylonian inch, the table of these being as follows:—

60 uban = 1 cubit.
6 cubits = 1 kan, cane or reed.
12 cubits = 1 gar or double reed.

In the dimensions given in this inscription there occurs one, the ku, which is uncertain in value. We have, as it occurs only once, assumed it to be 20 cubits, but this is only an assumption.

Following the above system of mensuration and notation, the dimension given can be made out with considerable facility. The length of the Babylonian cubit is uncertain. Drs. Oppert and Lepsius, who have devoted considerable study to the ancient systems of mensuration, have arrived at different results, and so, in the following calculations, we have adopted as the length of the cubit, 20 in. English, which is possibly a little short of the real equivalent, but it will give fair approximate results.

Herodotus, who visited and inspected the temple and the edifices connected with it, gives a very full description of the temple accompanied by his own general measurements, and it is very important to notice that in his order of description he follows very closely that of the inscription, and it is therefore very possible that the Chaldæan priest who acted as his dragoman may have been familiar with the inscription which is now so valuable to us. Herodotus states that the temple area was a large square enclosure, two *stades* each way. Assuming the Greek stade to be equivalent to 600 English feet, this would give 1,200 ft. for each face, and about 4,800 ft., or 1,600 yards, as the total circuit, equal to about $\frac{1}{12}$ of an English mile. The inscription commences by giving the measurements of the two great courts of the edifice. The first is called the grand court; the second the "court of the goddesses Istar and Zamama."

The Great Court was 11.33.20 in length; that is, following Babylonian notation, 11 × 3,600 by 33 × 60 + 20 uban = 41,600 uban or 693⅓ cubits = 1,156 English feet. The breadth was 9 × 3,600 = 32,400 uban, or 540 cubits = 900 English feet.

The dimensions of the Second Court were 10.33.20 uban = 38,000 = 633⅓ cubits = 1,056 feet English in length, and its breadth 4·30 uban = 16,200 uban = 270 cubits or 450 English feet.

We thus have as our dimensions of the two great courts of the temple,—

1. Great Court, cub. 693⅓ × 540 = feet 1,156 × 900.
2. Second „ cub. 633⅓ × 270 = feet 1,056 × 450.

We can see from these dimensions the excellent proportion and system of these two great courts. The second was 60 cubits or 100 feet less in length than the large court, and just half its width.

In the relative position of these great courts it is clear that the lesser was not placed within the greater, but was an outer one admitting to it; and in this arrangement we are supported by the testimony of Herodotus as to the external measurements. If the court of Istar and Zamama was the outer one, giving access to the great

* *Builder*, vol. xxxvi. (1878), p. 851.

one, and arranged as indicated in the accompanying plan, the total circumference of the whole block is nearly equivalent to that given by Herodotus. From north to south external measurement we have 1,350 English feet; from east to west, 1,156 English feet. The former is slightly in excess of the two stade, or 1,200 ft., given by Herodotus, as the side of the square; the latter a little under. The above is taking the longest court as the width from east to west, but if the width of the small court, and that at the entrance, which Herodotus was most likely to take, are adopted, we have a width of 1,056, and a total circuit of 4,812 English feet, or only 12 ft. in excess of the circumference of 8 stade, recorded by Herodotus. As there is some doubt as to the exact equivalent of the Greek stade in English feet, this agreement may possibly be even more close. However, it is a strong proof of the accuracy of the general and possibly only round number measurements given by Herodotus.

The inscription next records the gates which gave admittance into the temple. These were six in number, namely,—the "Great Gate."* This was probably the gate leading from the city into the outer court. This was the same gate as that called, in the cylinder inscription of the great builder, Nebuchadnezzar, the "Gate of Fertility, the Seat of Zirat-banit." It is sometimes called the "Gate of Zamama," from the court to which it gave entrance. Close adjacent to this gate, on the outside of the temple precincts, was one of the great marts of Babylon, for in contract tablets mention is often made of bargains being concluded "before the great Gate of Zamama."

The "Gate of the Rising Sun," or the East Gate,† opposite to which was the "Gate of the Canal."‡

There appear to have been three gates admitting from the outer court into the "grand, or inner court." The centre one was the "Grand Gate,"§ while on either side were the "Gates of the Colossi," or winged bulls, and the "Gate of the Tower View."¶ The arrangement of these gates on the plan is, of course, liable to alteration, but we may certainly claim for them that they are as accurate in arrangement as many of the proposed ground-plans of the Jewish temples. On entering the outer court, the first object was the "great sea" or tank, used for the purpose of purification, and corresponding to the "brazen sea" in the Jewish temple, and the fountain for washing in the courts of Mohammedan mosques. This was called the Ki Gal** or *birut*,—the pool, and its measurements were 3 Ku square, or 60 cubits by 60 cubits = 100 ft. square. There were four entrances or gates on each side. There is no indication in the inscription of its position in the court, but it was probably placed so as to be convenient for a worshipper entering by any of the three outer gates, and so may conjecturally be placed near the centre. It was lined with stone, and supplied with water from the Euphrates by an underground conduit, traces of which exist. In the centre of the great inner court rose the ziggurat or stage tower, which gave to this temple its name of the "Temple of the Lofty Head." This great tower, of seven stages, was called the "foundation of heaven and earth." In the cylinder text just published, Nebuchadnezzar claims to have restored this vast pile. Herodotus thus describes the temple tower:—"In the middle of the precinct was a tower of solid masonry, a stade in height and a stade in breadth, upon which was raised a second tower, and on that a third, and so on up to eight."

The dimensions here given for the base of the great stage tower far exceed those of the inscription, and the only supposition for this discrepancy which we can adopt is, that since the time when the text was written, probably in the reign of Nabonidus, B.C. 555, large additions had been made at the base, or a platform introduced, which Herodotus takes as his base for the measurement.††

The base, according to the inscription, was 15 gar or 180 cubits square, with a height of 5½ gar or 66 cubits; that, in English measure, being 300 ft. square by 110 ft. high. It will be seen from this that the lower stage, according to Herodotus, is just double the dimensions as given by the Babylonian surveyor. In order that the measurements of this tower may be the better understood, the dimensions are arranged in order, thus:—

	Cubits.		English Feet.	
	Side.	Height.	Side.	Height.
Base	180	66	300	110
Second	156	36	260	60
Third	120	12	200	20
Fourth	102	12	170	20
Fifth	84	12	140	20
Sixth	66	12	110	20
Seventh	42 by 48	30	70 by 80	50*

From these dimensions it will be seen that the height was 300 ft., exactly equivalent to the side of the base, and therefore in true accord with the square canon of proportion so much used in the buildings in Babylonia. Following the analogy of the other great temple towers in Babylonia and Assyria, we are able to gain a very fair knowledge of the construction of this vast pile. There were temples of this character with tall ziggurati or stage towers in Babylonia at Borsippa (the Birs Nimroud), and Cutha (Tel Ibrahim), and at Ur (Mughier), as well as in Assyria at Assur (Kileh Shergat) and Calah (Nimroud), at Nineveh (Koyunjik), and at Dur Sarguia (Khorsabad). The Greek writers state that the seven stages of the temple towers were each of them coloured according to the divinity to which they were dedicated, and this statement meets with confirmation from the discoveries made in the excavations round the base of the great tower at Khorsabad. There were found there bricks covered with coatings of stucco and painted blue, black, red. The excavations made by Mr. Rassam at Babylon, and especially in the Amran mound, have brought to light a number of bricks covered with coatings of coloured plaster, showing that this mode of decoration was in vogue in Babylon, and we may therefore conclude that the stages were decorated with bricks according to the proper colours of the seven great gods. According to Sir Henry Rawlinson, who has devoted much study to this subject of the construction of the Temple of Belus, the colours were arranged thus, base black, second white, third purple or dark blue; fourth, light blue; fifth, red; sixth, silver; seventh, gold. The inscriptions show that the summit was covered with gold, as we shall see when we come to examine the accounts of the shrine Bel, which crowned the summit of this edifice. Considerable divergence of opinion has existed as to the construction of these great stage towers, and in some of the illustrations which used to adorn, rather than illustrate, pictorial Bibles and works on Biblical archæology, the restorations of the Tower of Belus were strange indeed. These great towers were solely intended for observatories, and were called "houses of observation." They were in all probability solid in the interior, being composed of brick casings filled in with earth, and may roughly be said to resemble seven solid proportionately-decreasing cubes placed one on top of another. In recording his restoration of the great seven-stage tower at Borsippa (Birs Nimroud), Nebuchadnezzar speaks of "the filling up the interior with earth and casing with brick." The great tower at Kileh Sherghat, the ancient Assur, which had fallen into decay, was restored by Rimmoniari in the thirteenth century, and from the foundation record now in the British Museum we gain some details of the construction. The king says, "Its site I enclosed, its strengthening I accomplished, with stones and earth I made." If, therefore, the materials employed were only earth core and sun-dried bricks with an outer casing of kiln-burnt bricks, the decay of the edifice would be rapid and a great mound of *débris* would mark the place. Moreover, nearly all traces of plan would be obliterated.

Stone being almost entirely wanting in Babylonia,—it could only be obtained from a great distance, and at great expense, and, as the inscriptions show, was regarded as precious,—its use was far from general. The building material was exclusively of brick, either kiln-burnt or sun-dried, and the ever-recurring phrase in the royal specifications is "with bitumen and brick I made strong." The use of reeds as binders is mentioned by Herodotus, and proved by the extant remains to have been practised. This is noted by Mr. Rich in his memoir on the ruins. He states that he found "at the Mujelibe layers of reeds on the top of every layer of mud-cemented bricks." And impressions of reeds are often found in the bitumen adhering to the bricks.

There remains one other point to be noticed before passing to consider the great shrine which adorned the summit, namely, the means of ascent. In the inscriptions, the word rendered by some translators "staircase" is from a root meaning "to raise," "to exalt," "to ascend," and meaning rather "ascent," and we should consider, as we find it applied to ascents which must have been used for chariots such as the approach to the great gate of the palace at Nineveh, that the word rather applies to "inclines," gradual ascents, than to stepped stairs. The summit of the tower was probably reached by a series of such inclines, arranged as indicated on the plan.* To return now to the Greek historian, and his account of the great temple:—

"On the topmost tower there is a spacious temple, and inside the temple stands a couch of unusual size, richly adorned, with a golden table by its side." With this account of the temple we may compare the following extracts from inscriptions which record the beautification of the shrine. Assurbanipal, who had done so much to decorate Nineveh towards the end of his reign (B.C. 668-625), restored the shrines of Babylon, and especially that of Merodach, at Babylon.

"Bit-Saggal, the temple of the lord of the gods, Merodach, I made, I completed its † decorations. Bel and Bilit, the divinities of Babylon, and Hea (Oanes), the divine judge, from the midst of temple I brought.‡ I caused them to enter into Suanna.§ His holy place, fifty talents of gold . . . . with bricks I finished and enlarged. I caused to be made a ceiling ‖ of cedar-wood, beautiful as the stars in heaven, adorned with beaten gold. Over Merodach rejoiced my heart. I worshipped and performed his will.

A noble chariot,¶ the carriage of Merodach, prince of the gods, with gold, silver, and precious stones, I finished its work. To Merodach, lord of the gods, king of the host of heaven and earth, the sweeper away of my enemies, I gave *a couch;* ** of durable sycamore wood for the holy place, covered with precious stones, gold and silver, as the resting-place of Bel and Beltis, givers of favour, makers of friendship, skilfully I made."

Here we have a distinct mention of the couch as an important item in the furniture of the shrine some two centuries before.

According to another inscription, this couch was 9 cubits long and 4 cubits broad, or 15 ft. by 6 ft. 8 in.,—a size which fully justifies the expression of Herodotus, that the couch was of unusual size.

From the inscription now in the India Museum at South Kensington, which is full of details of the great works of building and restoration carried out by Nebuchadnezzar to the shrines, temples, palaces, and public works of Babylon, we may quote the following account of the restoration of this shrine in the early part of the sixth century, B.C.:—

"The shrine of the oracle of Bel of the gods, Merodach. Its gold-plated summit, like the daylight, shone; with marble and alabaster the interior I covered.

His holy shrine,†† the royal shrine, the shrine of his lordship the inspector of the gods, the Prince Merodach,

Which a former prince with silver had worked its work. With bright gold of surpassing splendour I caused it to be plated,

To the summit, the crowning point, with great beams, which from the mountains of Labnana,‡‡ lordly wood which they had brought,

For the ceiling of the shrine of the oracle of his lordship.

Even to the floor, the walls, the great beams, to the ceiling of the shrine, with bright gold I covered.

On the face of the beams and the ceiling with gold and precious stones I adorned."

On reading such a description of royal and lavish decoration of the shrine of the lord his god, the similar passages in the Hebrew books of Kings and Chronicles descriptive of the

* Shrine of Merodach.

TEMPLE OF BELUS AT BABYLON.—*Plan Restored from data furnished by the inscriptions.*

building of the great temple of Jerusalem are at once called to mind. "The shrine of the oracle," so lavishly decorated by Nebuchadnezzar, corresponded in the Babylonian temple exactly to the oracle (*debor*) in the Temple of Solomon, which was a cube of 20 cubits, and was overlaid with pure gold, as were all the fittings and the posts of the screen and the altar, &c. (1 Kings vi. 20, 30). There is no mention in any of the inscriptions of any statue of Merodach in this shrine, but in the temple, at the west side of the inner court, there was a seated figure of the great Babylonian deity. Herodotus states "that below, in the same precinct, there is a second temple in which is a sitting figure of Jupiter all of gold. Before the figure stands a large golden table, and the throne whereon it sits, and the base on which the throne is placed, are likewise of gold."

The temple thus described by the Greek historian is evidently to be identified with the large group of sacred edifices in the inner court on the west side. These consisted of three blocks forming three sides of a square. The dimensions of these buildings were,—

Wing I. 100 cubits by 20 cubits = 166 ft. by 34 ft.
Wing II. 100 cubits by 65 cubits = 166 ft. by 108 ft.

The main block joining the two wings was 125 cubits by 30 cubit = 208 ft. by 50 ft.*

These temple buildings are evidently to be identified with those described, in the India Museum Inscription (col. iv., line 7) as being restored by Nebuchadnezzar. "The temple of sacrificial victims, the high place of Bel of the gods, Merodach, the inspector of seasons and chief of the angels and spirits. In the holy places of Babylon with bitumen and bricks I made." A much fuller description is to be found in an inscription belonging to the early Babylonian empire, which was copied and possibly re-edited by Assurbanipal's orders. From this inscription† it appears that the temple was richly adorned with gold and silver, and that in it were statues, seated figures of Merodach and Ziratbanit, his consort. It is curious that Herodotus notes especially that the figure was seated, as this mode of representing deities was usually adopted by the Babylonians, as shown on the seals and gems. There is a curious passage in this inscription which may be quoted here:—

"For the shrines of Merodach and Ziratbanit a rich dress, a princely dress, dress of dark blue and gold spar I clothed them. With sets of robes their great divinities I had adorned; lofty-horned crowns, crowns of dominion, emblems of divinity, which were perfection, perfect I gave."

From this it is evident that the stone figures were clothed, and thus the rude stiffness which is so marked a feature in the statues which have been recovered, such as the Nebo figures in the Museum and the seated figures, would be hidden. This also calls to mind the passage in the "Iliad" of Homer, where the clothing of a statue is mentioned.*

It is evident that this block on the west side of the great quadrangle was the "sacrificial temple" of Merodach and his consort, and here were the images of the gods. It is this temple which the writer of that strange appendix to the Book of Daniel, the story of Bel and the Dragon, refers to.

There were several other temples within the great enclosure.

On the east side of the court was a temple dedicated to Nebo and Tasmit his wife. The dimensions of this temple were 80 cubits by 40 cubits = 133 ft. by 67 ft.

In the India Museum inscription we have the following description of the temple,—"The Temple of Nebo, the supreme intelligence of the gods. He who is the giver of the sceptre of justice for the ruling of all men. 'The Temple of the sceptre.' His temple in Babylon with bitumen and bricks I built, and worked its work."

This temple is to be distinguished from the great Temple of Nebo at Borsippa, which was a rival of the great Temple of Belus. The temples on the north side were two, one dedicated to Hea or Neptune, "the Oanes" or "teacher of wisdom." This temple was 85 cubits by 30 cubits = 142 ft. by 50 ft.; and adjacent to it was a temple dedicated to Nusku, "the messenger god," the Mercurius of the Babylonians. This temple was in dimensions 35 cubits square, or 85 ft. by 85 ft. Neither of these temples appears to have been repaired by Nebuchadnezzar. The Temple of Nusku was, however, restored by Assurbanipal, king of Assyria, who thus describes it:—"The dwelling of Sin and Nusku, which a former king, my predecesser, had built; from the beginning had been left, that dwelling had become old. The dwelling of Sin and Nusku its damages I repaired, beyond what was before I enlarged its site. From its foundation to its roof I restored it and finished it."

The doors were covered with silver and precious stones, and eagle-headed figures, the emblems of Nusku, guarded the doors. On the south side was the temple dedicated to Anu and Bel, and not Bel Merodach the Babylonian Belus or Jupiter, but the lesser Bel. The dimensions of this temple were 70 cubits by 30 cubits, or 117 ft. by 50 ft. There is no mention of this shrine in the inscriptions of the great builder-king Nebuchadnezzar, but in the copy of an early Babylonian text above referred to the restoration of the edifice is briefly recorded.

The Temple of Belus, the principal features of which are above described, may be said to be the heart of Babylonia. When all was well with the empire it was rich and prosperous; and pious and successful kings lavished treasure on its shrines. When the invader, the conspirator, and the rebel disturbed the land, then did sacrilegious hands seize on its gold and silver to bribe the aid of some potentate. But this temple is not only a pivot round which cycles of Babylonian history revolve, it is a land-mark in the history of Western Asia. The temple-tower or ziggurat of Belus raised its head above the surrounding plain when Abram set forth on his journey to distant Canaan. So, centuries

* See plan H.

† WAI. v. pl. 33.

* "Iliad," vi., 297-303.

after, it looked down on the captives which Nebuchadnezzar the conqueror carried away from the city of the Jews; it saw the birth of the Jewish nation, and was witness of its death. Built centuries before the temple of Solomon, its treasure-house was the receptacle for the vessels carried to Babylon as spoil.

With these facts before us, it is very possible that its construction in some degree afforded the Jews, a none too inventive people, a basis for the second temple. There are many points of agreement. The Holy of Holies and the shrine of Merodach exhibit very similar construction. The Great sea finds its equivalent in the *Birut* or tank,* while the court of the goddesses Istar and Zamama corresponds to the Court of the Women. It was in this outer court of the temple that the ceremonies described by Herodotus and the Hebrew writer, Baruch, connected with the worship of the Asiatic mother-goddess, took place.

It is hardly to be wondered at, when we consider how greatly Babylonia had influenced all Western Asia in religion and mythology, that it did with that influence also exert some influence on the religious architecture.

It is now time to pass to the consideration of the question which of the great mounds marking the sites of the ruins of the great edifices of Babylon covers the ruins of the Temple of Belus.

In dealing with this point, there are certain facts which must be borne in mind, and these are of considerable importance. First, that Rich, Rennel, and others who have written learned treatises on the ruins of Babylon, could not read the inscriptions, and were, therefore, only guided by the very second-hand information of Greek writers. Then, also, there must be remembered that for centuries Babylon has been the brickfield of the builders of the districts of Hillah and Baghdad. The houses, the court-yards, the fortifications of Hillah, and a great part of the works of Baghdad, are built with bricks which bear the name and titles of Nebuchadnezzar. When we consider this, we must see that many of the ruins have been greatly reduced by this constant carting away of bricks, and so do not represent so great an altitude as formerly, while *débris* is largely spread over the surface. It will be admitted that where a brick is found bearing an inscription referring to a definite edifice, the probabilities are that the spot where it is found is the site of that edifice. So we see that a slab found in one of the mounds of Babylon which bears an inscription reading the "palace of Nebuchadnezzar" should mark the site of the palace; while another bearing the "legend of the Temple of Bit Saggal" should mark the site of that temple.

Most writers have regarded the Babel mound situated at the northern extremity of the *enceinte* of Babylon as the site of the Temple of Belus. But the explorations carried out on the site by Mr. Rassam in 1878, which led to the discovery of a number of wells and extensive hydraulic apparatus of conduits, &c., would seem most strongly to show that this was the site of the new palace, and the precincts of which were the celebrated hanging gardens.

Passing south a mile, we come to the next great block of ruins, the Kasr or palace mound. Arab tradition marks this as the palace of the Babylonian kings,—the old palace,—and this meets with confirmation by a brick inscription which records the legend, "the palace of Nebuchadnezzar, king of Babylon." It is therefore most probable that this is the site of the palace of Nebuchadnezzar. This inscription reads,—

"The palace of Nebuchadnezzar, king of Babylon, restorer of Bit Saggal (Temple of Belus), Bit Zida (Temple of Nebo). In the service of Nebo and Merodach, his lords, he has gone forth. Son of Nabupalassar, king of Babylon."

This inscription differs somewhat from the usual stereotyped phrases of the brick legends, and clearly belongs to the palace; its being found in the Kasr mound would therefore seem to mark that spot as the ruins of the palace.

At the southern extremity of the *enceinte* of Babylon is a large mound usually called the Amran mound. It derives its name from an imaginary son of Ali, named Amran, whose pretended tomb is here. It is somewhat unfortunate for Moslem martyrology that Ali is proved to have had no such son. It is very possible that the Arabic Amran is an echo of the old name of Namir, "the bright place," which was given to the temple, the great tower being called Namir Bel. This mound, according to the measurements of Mr. Rich, was 1,100 yards long and from 800 to 900 yards broad. This ruin is considerably larger than the dimensions of the temple in the description we have examined, but the amount of *débris* from the stage tower and the walls may very greatly have increased its area. From this mound comes a brick bearing the following inscription:—

"To Merodach his lord, Assur-akhar-iddina (Esarhaddon), king of the land of Assyria, king of Babylon, with bricks the temple of Bit Saggal (Belus), and the 'Temple of the Foundation of Heaven' (the stage tower), anew he has caused to be made."

The excavations on this site have brought to light great numbers of bricks, and fragments of coloured and stucco-coated bricks, as well as plaster capitals and cornices inlaid with glazed tiles. It is, therefore, most probable that we shall find that beneath the *débris* of the Amran mound are the ruins of the Temple of Belus.

Mr. Rassam's explorations on the site of Babylon have shown that the ruins of the establishment of Egibi & Sons, the great bankers, tax collectors, and land agents of Babylon, whose inscribed documents afforded us so much information* regarding the topography of Babylon, was situated in a spot now marked by the Jumjuma mound, a little south of the Amran. In these contracts we have frequent mention of bargains concluded near to the gate of Zamama, and we may therefore suppose that this gate was close adjacent to the business establishment of these great traders. In conclusion, we can only say that the question of the topography of ancient Babylon is one that presents great difficulties, as the ruins have been for years the brickfield of the district, and this irregular excavation has, no doubt, destroyed numerous traces of the plan of the city, which would have been invaluable to the student of archæology. The long and extensive series of explorations which Mr. Rassam has been able to carry out on the site of Babylon, and the results of which will be made known to us on his return to England, will, no doubt, contribute much to the solution of the many problems connected with great Babylon.

* Perhaps the Birket-Israel would be more appropriate.

AN ENGINEERING AID-BOOK.†

THIS is the second part of a useful book. On the publication of the first volume we said (*Builder*, 27th of April, 1878) that its study might save much time, much money, and consequent heartache. In the present volume we find the results of much experience, and of much of that yet rarer qualification, common sense, made available to the inquirer in a systematic form. Taking, for example, Chapter xiv. (which is the first in the present volume), "On Contract and Purchase in the Building Trades," we should characterise it as a skeleton form of thought applicable to the subject,—a sort of mental algebra, by the use of which, substituting the true values for the algebraical values, the student can hardly fail to obtain a true answer.

There is, however, one part of this chapter which would fairly bear to be treated at much more considerable length. We refer to the subject (p. 30) of "Payment by Results accomplished." The author justly says that to the spirit and enterprise of contractors, who have taken upon themselves the risk of failure, the carrying out of many important works which would not otherwise have been attempted is due. We confess a leaning to the opinion that for large and important works the best method of arrangement is that of a lump contract for a definite sum, to be only increased or diminished by an increase or diminution of the work ordered by the engineer. It was upon this principle that the earliest contracts for railways were based, and we think that upon the whole, it has been found to work better for both parties, the company and the contractor, than any other method. In cases of contracts under foreign Governments abroad, we think that this mode, carefully advised upon, not only by an English lawyer but by a local lawyer, affords almost the only security for a contractor. In the earliest English contracts,—those, for instance, made to carry out the specifications of Mr. Robert Stephenson for the London and Birmingham Railway, there were three schedules attached,—one for additional work, one for deductions, and one for valuation of monthly measurements. This method has been abandoned as complicated. We hold to the opinion that it is the most fair, and therefore the most economical. We can call to mind an instance in which, owing to some arrangement with an independent railway company, the levels of a line were so altered that a large embankment, preparations to carry out which in the specified time had involved the contractor in the purchase of a large plant, was abandoned. To settle this deduction simply by deducting the scheduled price for that quantity of earthwork as *not done* would have been grossly unjust to the contractor. Slight additions or deductions may be made, if they balance each other, at an average price. But to set to work with a single schedule of prices, the quantities being taken only approximately, can only fairly be done in cases where the experience of the quality and cost of the work is ample, and where the contractor can be quite at ease as to his calculations of more or less. We are strongly of opinion that contracts for great works should be so arranged, in the first instance, as to avoid the labour, delay, and usual squabble attendant on "measuring up" at the end, in order to make out the contract bill. Nor do we see how this end is to be attained, except by the method of a lump contract, alterable only on ordered and executed deviations from the contract quantities,—the value of the additions or deductions corresponding to which should be directly ascertainable by fair schedules of prices attached to the contract itself. Whenever a contractor departs from this method of protecting himself, he must do so either by appreciably increasing the price of every item in his schedule, or by running a risk of disaster, which would probably cost the company far more than they could hope to recover.

There is a novelty in the typography of Mr. Matheson's book which we hope to see extensively followed. We hardly know whether the author will at once take it as a compliment when we say that he presents us with a reversal to the most ancient form of writing, the hieroglyphic; but so it is. Mr. Matheson has revived, after a disuse of more thousands of years there it is needful now to count, an expedient which puzzled the early students of hieroglyphics, until it was understood. In the Egyptian writing of the last 5,000 or 6,000 years it may have been a surplusage, but even there it has at times proved of singular value. We refer to the use of the ideographs or determinants. Thus, if we find the letters (hieroglyphic symbols) "d . o . g." in this kind of writing, they may be followed by a little sketch of a dog. We will not now enter on the question how far each written symbol of sound was originally ideographic, but will come at once to the use made by Mr. Matheson (no doubt with perfect unconsciousness) of this ancient method of explanation. One of the best points of the book, as far as the work of the printer is concerned, is the clear and good system of marginal indications of subject, which forms the basis of a good index at the end of the volume. The novelty in this is the introduction, also in the margin, of a little sketch of the subject of the section. Thus on p. 258, under the marginal head "Water Cranes," we find the sketch of a water-crane, and that of a water-tank with attached hose. The particular instance on which we have lighted is, however, defective in one respect. Neither "Tanks required," nor "Swinging Jib," which are in the margin, are to be found in the index. Nor is there any list of cuts, nor indication to the reader as to the page at which 133 and 134 are to be found. These additions are required in order to make the plan complete. But even as it is, the great aid afforded to any one who is turning over the pages of the book in search of any particular subject by these little marginal ideographs is very great. The cuts are generally good. They might, perhaps, be multiplied with advantage, and in the event of a new edition (which can only be a question of time), we suggest to Mr. Matheson the propriety of introducing a special index of these marginal illustrations, which need only contain the cuts themselves referred to the pages on which they are to be found. This would save the time of turning over the leaves, and may be developed into an aid to the reader, or more properly to the consulter, of volumes of this nature, of a value hard to exaggerate.

* See *Builder*, vol. xxxvi. (1878), p. 832.

† Aid-book to Engineering Enterprise Abroad. By Ewing Matheson, M. Inst. C.E. London: Spon. 1881.

The chapter (xvii.) on "Transmission of Power," is one that has been written with much care and judgment. It brings down the "burning question" of the electric transmission of power fully to the date of publication, although the recent experience of the transmission of a charged Faure battery opens a new chapter in this vital part of mechanical science. The examples given (p. 100) of the transmission of power for as much as four miles in Sweden, by the use of wooden connecting-rods, and that of the transmission, by ropes, of 700 horse-power obtained from three turbines, at Zurich, especially command attention. This chapter presents a remarkable parallel (although, of course, involving much more detail) to the paper by Mr. Conder on the same subject in the new American periodical, "The Progress of Science," which has just been commenced at Boston, U.S. There is, however, one point in the latter paper which Mr. Matheson will do well to extract from that journal in his next edition. We refer to the proportion between the horse-power expended in the working of machinery, and in the net effect produced by that machinery. This is illustrated in a very exact manner by the accounts of the working of the wire rope on the Blackwall Railway, under the direction of Mr. Robert Stephenson.

It is remarkable that in a chapter so comprehensive as to include the subject of the transport of force, under the head "Transmission of Power," which is, perhaps, rather touching on another province, the author should have taken no notice of that method of transmitting power which is by far the most important of all. We refer, of course, to the locomotive engine. It is true that in the chapter on "Railway Equipment," as well as in a chapter on "Railways" in vol. i., the reader will have no difficulty in obtaining information as to the railway locomotive. But what should have been found with regard to it in chapter 17 is the investigation of how much mo ive power is consumed in working the locomotive, as compared to that consumed in the traction of the train. Had we space here to discuss the question, we should be able to show that a loss of something like 80 per cent. of the effect of the steam produced is incurred by its application through the medium of the locomotive propeller. This is a subject which ought to be freely discussed in dealing with the transmission of power.

The chapter on "Railway Equipment" is another instance of what we may call tabulated good sense; and is one of those which is best illustrated by the marginal cuts of which we have before spoken. Those of different forms of rails (pp. 239–241) are especially noteworthy as examples of how effective the graphic table of contents may be made. The sketch of the Barlow Rail calls attention to Mr. Matheson's comment, which hardly does justice to that ingenious invention. The chief objection to it hitherto has been the fact that it is only when the price of iron is abnormally low that it can compete, economically, with other modes of laying. It is also harder to run on than a sleeper line, probably requiring less engine power, but costing more in vehicle and locomotive repairs. At the present time a question would arise as to the feasibility of rolling an iron Barlow Rail with a steel top. If this can be satisfactorily effected, the value of the method for such cases as the Euphrates Valley line is of the first order. A railway can be more rapidly laid, we can say from a good deal of experience, of Barlow rails than of any other construction. When laid it presents a pair of solid continuous metallic bars, which are safer against any hostile meddling than any other form of rail. And, in addition to this, the rail will provide a perfect safeguard for the cable of the electric telegraph, if the isolation is thoroughly effected. Thus, for any case like the Candahar railway, or the great line which we yet hope to see laid on the right bank of the Euphrates, the advantages offered by the Barlow rail would be so great as to justify the engineer in making use of that system, even if somewhat more costly in the first instance than one involving wooden sleepers, subject as they are to attacks from insects, from decay, and from mischievous attempts at displacement. Any savage could pull to pieces a railway keyed into chairs that are bolted to sleepers. Very few would know how to commence operations against a riveted permanent way of Barlow rails.

If Mr. Matheson had not given us a good book, we should not have taken so much trouble to point out one or two improvements that may be made in the second edition. We can conscientiously recommend the volume to our readers.

ST. MARY OVERIE, SOUTHWARK.

ALL possible credit is due, on the part of those who are interested in the history of architectural monuments, to Mr. F. T. Dollman for the labours which he has bestowed in illustrating and commemorating the history of the most interesting and important church in London, next to the Abbey and the metropolitan cathedral. The folio volume* which he has published, in illustration of St. Mary Overie, may be said to have been a labour of love, and of very devoted love; for he tells us that he has been for fourteen years occupied in collecting the materials and making the drawings for it; and a publication of this kind of book is, commercially, a way of spending rather than a way of making money.

The book consists of a history of the church, including a good many curious details not bearing directly on its architectural history, but illustrating the manners and habits of various periods from documents connected with the church, as well as the varying attitude of mind towards architecture of the official bodies who ruled the church in post-Reformation times. The larger bulk of the volume is occupied by forty-four plates, photo-lithographed from the author's drawings, giving measured details of the portion of the ancient church still existing, the choir and retro-choir, and restored drawings of the original nave, which was pulled down in 1838, and replaced by the present gingerbread interior. As regards the manner of the drawings, they have been very carefully executed, and show a great amount of work. We have only two slight criticisms to make, which we do rather for the attention of those who may be moved to produce similar books of illustration. The one is, that some of the drawings are really rather spoiled by the shading and touching, which is somewhat too scratchy for our liking; for instance, the graining all over the woodwork in the elevation of the classical reredos (plate 31) is too coarse and scratchy-looking to improve the effect of the drawing, and, at the same time, it has consumed more mechanical labour than it was worth; and in some of the other drawings there is a good deal of surface-touching, on the masonry, &c., which would have been better omitted; it is not done with sufficient artistic feeling. High finish in surface touching and shading is no doubt an addition to architectural drawings, if it is done very finely and delicately; otherwise it is better omitted. In other respects the drawings are all that can be wished. The other small point we may mention is that the writing on some of the drawings might have been better and more neatly and legibly done. It is the fashion of draughtsmen nowadays to scribble the necessary notes and explanations on their drawings in a rather rough-and ready manner; this may pass in drawings which are only intended as passing illu-trations in a journal (though we beg to intimate that we do not desire to have such scribbly drawings offered to ourselves), but in a book which is intended as a permanent and important contribution to architectural illustration, such as would find place in architectural libraries (as this one certainly should), we do like to see neatness and finish in all the details.

This is, however, only a minor point, and does not impair the essential value of the publication. The interest of the book, in an illustrative point of view, is increased by the fact that the author has had the advantage of making use of some of the drawings of portions of the old church, which no longer existe, made by the late Mr. Gwilt, at the time when he was engaged in repairing the choir. We thus have some authentic records of portions of the building which have now disappeared. The choir of St. Mary Overie still remains essentially as it was (internally, at least), a fine specimen of Early English work of very solid and dignified type; and with a vault which is a remarkably fine specimen of quadripartite vaulting, and affords a marked example also of that peculiar twist of the diagonal rib and its continuous vaulting surfaces, from the unequal transverse and longitudinal width of the bays, which Sir G. Scott called (not inappropriately) "ploughshare" vaulting. The nave of the church has gone through three epochs. Built in the same style and at the same date as the choir, the vault fell in in 1400, a result which has been supposed to have been partly due to the removal or weakening of the buttresses. It was reconstructed with a wooden vault of considerable elaboration of design. In 1831 this roof was removed, it also having become, or supposed to have become, dangerous from decay and dilapidation, and the service of the church temporarily transferred to the choir while the vestrymen and ratepayers quarrelled with each other as to what should be done with the nave, which, in the mean time, was left standing unroofed. Party-spirit ran very high at this time in the parish of St. Mary, of which Mr. Dollman gives some amusing examples in the republication of some of the circulars and p sters issued by those who considered themselves concerned in favour of this or that scheme. The tone of these precious documents may be said to represent the most typical form of a vestryman's mind, and shows a marvellous degree of vulgarity and ignorance, and the reduction of every consideration in reference to the treatment of the fine old church to the most pure and unadulterated test of £. s. d. Eventually the nave was removed and the present specimen substituted, which, such was the incapacity of people at that time even to see correctly the architectural facts that were before their eyes, was believed to be in the most exact conformity with the style of the remaining portions of the original structure. That the choir was not removed and rebuilt in the same fashion was owing, not to any regard for the structure, but simply to the opinion of a majority of the ratepayers and vestry that it would be an unnecessary expenditure of money, against which the most vigorous protests were raised.

The style of the existing portions of the church is well known to all in London who take an interest in Mediæval architecture. Of the original nave, including its vault, Mr. Dollman gives a restored perspective view, and also a section and details of the later oak vaulting which superseded it. We have not been able, however, to find any precise statement as to the authority for these representations. The author states in his preface that he has shown nothing but what he has *bonâ fide* evidence for in the shape of sketches, drawings, or memoranda, nothing of mere conjecture or fancy of his own having been introduced; and he also states that through his introduction to the family of the late Mr. Gwilt, he was enabled to make use, as we have already mentioned, of a number of the drawings made by Gwilt at the time when he was architect for the repair of the choir. In one case, in the elevation of a Norman door which existed in the old nave, he appends a note that this drawing was made from an accurately measured sketch from the original doorway by C. E. Gwilt. We presume, therefore, that the details of the oak vault and of the general architectural design of the nave is also from sketches of Gwilt's, but we have not been able to find any statement as to the source from which this portion of the illustration is derived: it would have been better if this had been more explicitly stated. The drawings of the original stone vault which fell in 1400 must, after all, we presume, be entirely conjectural.

Among the most interesting sheets in the illustrations are some of the various small details, both of parts of the building and of various objects of furniture which had belonged to it. These are collected apparently from many sources, from drawings in different collections or publications, as well as from objects which still exist. Among the latter may be included a considerable number of the carved bosses of the oak roof of the nave, which are still preserved in the building. There are also some interesting sketches of bits of building contiguous to the church, now demolished; some of them very interesting examples of old, picturesque, unsanitary London. On one plate (10) we notice a couple of small sections showing the levels of the roadway and approaches of old London Bridge and the present bridge respectively, in relation to the church, showing how much the church has been put in a hole, on one side at least, by the raising of the level, in accordance with the usual tendency in towns, where the ground-level almost invariably rises as time goes on. With the slight drawbacks of execution which we have alluded to, Mr. Dollman has produced a most interesting and valuable

* The Priory of St. Mary Overie, Southwark, comprising (1) the history, (2) the description, (3) the illustrations, of the church and conventual buildings. By Francis T. Dollman, architect. London: W. Drewett, Southwark, and Dryden Press, Long Acre; and of the Author. 1881.

monograph of a very important building, and done thereby a great service to architects and archæologists.

THE LIVERPOOL LANDING-STAGE.

OUR readers may remember some time since the announcement of the unfortunate destruction by fire of the then new landing-stage in connexion with the pier on the Liverpool side of the Mersey. This large and fine floating pier was before long reconstructed, but the elements seem to be against it, and it is now under the influence of a new and serious danger from the alteration of the bed of the river. The landing-stage is moored parallel to the dock walls at a sufficient distance to float in water which shall be always deep enough for steamers to come alongside at all states of the tide; the want of depth at the old stone pier, the base of which is, in fact, dry at the lowest tides, having been the original *raison d'être* for the landing-stage. The latter, reached by bridges from the pier, thus forms the medium of communication for all the steamer traffic with the town, the regular service of ferry steamers to different parts of the Cheshire side occupying the south end of the stage, while luggage-boats and some of the smaller class of sea-going steamers make use of the rest of the length. About a quarter of a mile south of the end of the landing-stage there has long been, adjoining the Liverpool shore of the river, a shallow known as "Pluckington Bank," nearly dry at low tides, and which, though varying very much in its outline and conformation, has for some years remained pretty much in the same position. But during the last few months Pluckington Bank, for reasons which no one has discovered so far, has enviously and insidiously commenced moving northwards down the river towards the landing-stage, under about one-third of which there is now a formidable sand-bank, which seems to be slowly moving along. Any one now going down on to the landing-stage at low water may see a very curious sight. Looking southwards along the stage, he will see its whole floor twisted, the further end rising considerably, and the side next the dock walls also rising, the floor of the stage thus undergoing a kind of double twist. Part of the stage is aground, in fact, and the rest floating. The stage is carried on floating iron pontoons at right angles to its length, so that one end of a number of these is aground at low tide. What sort of effect this will have upon the plates and rivets of the pontoons may be easily imagined, and we should have expected to hear that some of them were hopelessly leaky before now. A great amount of inconvenience to traffic is also being caused from the insufficiency of water for the ferry steamers at low tide, so that at certain states of the tide they have all to leave their usual quarters and bring up at the other end of the stage, which is so long that the change of position may mean the missing of a boat by passengers who come down to the wrong end. This, however, is a minor matter compared with the serious damage to property which seems to be threatened, and the difficulty of applying any practical remedy.

The method which Mr. Lyster, the Liverpool Dock Board engineer, has recommended, and preparation for which is being made, is to construct sluices along the pier wall, and pour a large body of water from them over the bank, so as to create an artificial scour, and wash the sand away. We confess to being somewhat sceptical as to the efficacy of this expedient. What was very evident to us was that a great deal of money is being sunk in masonry in the construction of the sluices, and that more will have to be sunk before this method, if it does answer, can be effectual, as the bank has already extended considerably further since the construction of the sluices was commenced, and it will evidently be necessary to follow its course further; and we are disposed to think that the mass of sand which has been formed between the landing-stage and the pier is rather too formidable an obstacle to be dispersed by running water over it, at least by any such mass of water as can well be artificially sent over it. It is at present the will of the Mersey, with its strong tidal ebb and flow, to pile up sand here, and it seems very questionable whether the power of the river can be fought with by an artificial sluice. Moreover, the dock engineer does not talk of having his sluice ready for operation till October, and if a good autumn gale comes on before then, it may make short work with the north end of the stage, for the Mersey at Liverpool is really more an estuary than a river, and a gale from some quarters gets up so much of a swell that the stage would soon thump herself to pieces on the bank under such circumstances.

The municipal council, judging from the reports in the local papers, seem to take the matter rather easily, and to have faith in the result of their engineer's operations, with the exception of an irrepressible member who has repeatedly and strongly urged that the corporation should obtain the opinion of one or two leading harbour engineers as to the causes of the shifting of the bank, and as to what the Mersey is doing. We know nothing of the member in question but his name, which is of no consequence here; but, judging from the obvious facts, we are disposed to back him. We fear the matter is likely to prove a more serious one than the corporation authorities are aware of, and may throw great difficulties in the way of the steamboat traffic of the Mersey, besides the loss or damage of property. It is clearly a case for investigation by the most experienced authorities in harbour engineering. They might be able to determine the causes of the shifting of the bank. We were not able to come to any conclusion on the point, except the negative one that we do not believe it has, as some people seem to suppose, anything to do with the effect of the landing-stage itself upon the action of the river. This would, under ordinary circumstances, be all the other way. The old smaller landing-stage, which was moored in the same position, so far from showing any tendency to lead to the accumulation of sand, had scooped a depression in the bed of the river under it from the scour of the water beneath it, which is just what might be expected from the effect of a strong ebb (and the ebb in the Mersey is very strong) running under such a floating obstacle. The causes of the present difficulty in the Mersey must be looked for, we surmise, from changes in the river itself. If the engineer's sluicing operations are carried out, however, we shall be considerably interested to see the result.

GROWTH AND ASPECT OF DUBLIN.

BLACK SPOTS.

As on some former occasions, we have made a circuit of a large portion of Dublin and its environs with a view of seeing what changes for the better are taking place. Notwithstanding some building improvement, in a sanitary direction, most of the defects we previously pointed out remain unrectified. The old quarters of the city, on the south side of the Liffey, and the old and more modern quarters on the north side, are unimproved and hastening to that description of rapid decay which bespeaks danger to the public safety, and a large measure of demolitions at no distant date. It requires a knowledge of the eighteenth-century growth and position of Dublin to estimate aright the changes that have taken place in the aspects of the city in the present century, and the influences that have been at work in producing the marked social changes. We cannot, however, here enter at length into such a discussion, for it has its political as well as industrial and social bearings. It is a singular and suggestive matter that the finest streets of houses of the northern portion of the city, and that, too, the most modern part of the town, should so rapidly go down, and be deserted by the well-to-do gentry who once resided in them. Since the commencement of the present century a large number of streets on the south side of the Liffey,—once busy, industrial centres,—have been decaying, but not until a quarter of a century since did any marked decay become visible in respect to a large number of streets north of Sackville-street, embracing Rutland and Mountjoy squares; Gardiner and Gloucester streets, Summer Hill, and contiguous streets. In fact, this northern portion of modern Dublin, as a built-on portion of the city (with little exception), dates back not more than a century and a half. From the middle of the eighteenth century until its close building was rife in the northern portion of Dublin, and during the period the streets named and scores of others were opened up and built upon. The houses in general were well built, were intended for and occupied by private families, and a large number of them were five stories high. These fine houses now are to a great extent tenement-houses, and the evils inseparable from such buildings under their new conditions are only too apparent. The northern part of the city, with its immediate environs, a century ago and much less, was a fashionable district much recommended by the medical faculty of the period, and much resorted to by invalids. A reaction set in fifty years since and upwards in favour of the southern environs of Dublin and sea-side districts along the bay extending from Irishtown and Merrion to Kingstown. The opening of the first constructed railway line in Ireland, the Dublin and Kingstown Railway, in 1834, gave a great impetus to this fashionable migration. As a link in the chain, the embarkation of George IV. at Dunleary (now Kingstown) led to the improvement of the harbour, and its appointment as the mail packet station, which it remains to the present day. Kingstown grew apace during the last half-century, and with it the other marine districts along the southern side of the bay. The extension of the railway line to Bray through the absorption of this first short branch in the Dublin, Wicklow, and Wexford Railway, further enhanced the southern sea-side environs for visitors and residents, and gradually thinned the northern city and suburban streets of their wealthy and well-to-do families. It is noticeable, however, that within the last dozen years a reaction is again setting in in favour of the northern suburbs a little further a-field, and that from Glasnevin through Drumcondra, to the marine or sea-side district of Clontarf, a considerable amount of house-building has taken place, and is still proceeding. Clontarf offers many advantages for villa residences, for it partly faces the bay, commanding a charming prospect of the Dublin and Wicklow chain of mountains across the water, and a fine inland background of the pleasant seats and farms on the plains of Fingal. The character of the new villa residences and other domestic buildings in the northern environs is not of a high order; indeed, the greater number of them belong to the cheap speculative class, which bespeaks indifferent materials, poor design, and poorer workmanship. In the southern suburban and non-marine townships, much domestic building has taken place within the last dozen years from Upper Rathmines and Rathgar, stretching to the Dodder river, and thence wending round to Donnybrook and Ball's Bridge. Some very fair classes of new villa residences are to be found in these districts, mixed here and there with houses of very flimsy construction, though efforts have been made to give them an ornate external appearance, out of keeping with their internal character and accommodation. Concrete cottage construction is developing to some extent in and about the environs of Dublin, but we have met with some wretched attempts with this material, which are a libel on its name, and do but little credit to the builders. Examination and inquiry on the spot, however, convinced us that the users of the material were the veriest building speculators, and that the mixed rubbish they used showed their unprincipled practices, and the valuelessness of their structures, which are fated to drop to pieces in a short time. *En passant*, we may observe that some excellent labourers' and farm cottages in concrete have been erected throughout the provinces of late, which fully meet the objects of their erection, — economy, durability, health, and comfort.

Pendent to our subject, we will now allude to the question of tenement-houses and artisan-dwellings in the City, matters that we have frequently discussed in relation to Dublin, as well as to English cities and towns. It has been stated that there are in Dublin about 25,000 houses, and of this number it will be near the mark to say 10,000 are tenement-houses,—houses originally built each for a single private family, but now inhabited, most of them by several families, often of the poorest class of workers. Many of these tenement-houses north and south of the Liffey ceased to be private dwellings half a century ago, and more; others only within a few years, but of course in proportion to the length of time that has elapsed since the change, the houses have become more and more ruinous and unhealthy. A large number of these tenement-houses have spacious rooms, and are situated in tolerably wide streets, but a much larger number are situated in back or side streets and courts, narrow, and often uncleansed for several days. In respect to some of the large tenement-houses in the wide streets, the fine garden spaces at their rear which they possessed when belonging to private families, have now to a great extent been built upon by the present owners of the houses, and the good stabling and coach-houses

attached have been converted into human dwellings. Thus, in once respectable localities there is a positive overcrowding unknown to the passers-by in the front streets, who little dream that there is a matted population in the back yards, garden ground, and even inhabiting the old stable-buildings in the lanes behind.

When we imagine houses of this character, five stories high, inhabited by from eight to a dozen families, with another living colony on the garden space behind, some conception may be formed of their sanitary condition and surroundings under their new aspects. It must also be remembered that in most of these houses the original accommodation that barely met the requirements of the residents when the houses were occupied by single families remains almost unchanged. It is needless to say the tenants of these houses, if they clean their rooms at all, are only concerned about the apartments they rent, and as to the staircases and halls, though they are in some cases washed down weekly by some common agreement among the tenants, by the employment of a charwoman, in numerous instances there is a total neglect of even this scant measure of cleanliness. In the southern quarter of the city, under the shadow of St. Patrick's Cathedral, there is a very large number of ruinous old tenement-houses which ought to be demolished forthwith, as they are dangerous to the public health and safety. Behind the northern line of quays extending to North King-street and further, and from the Royal Barracks easterly to the line of Capel-street, there are scores of streets, courts, and alleys, the houses of which form positive rookeries and fever nests. Hundreds of houses in these quarters cannot be improved, and it would be a mercy to demolish them if suitable provision could be made elsewhere for the evicted. This district, we have indicated, is the oldest part of the northern city, and the tenement houses and rooms over small shops inhabited in it are in as bad a condition almost as the much older class of houses in the south city, extending from the line of Bride and Werburgh streets, on through the Liberties and Coombe to Cork-street.

While a structural rearrangement is both feasible and advisable in respect to the best class of tenement-houses in wide streets only a few years ago abandoned by private families, to adapt them to the requirements of their present tenants, no structural alteration is possible in regard to the very old class of tenement-houses in the decayed southern and northern portions of the city above named. A wholesale demolition must sooner or later take place, and the sooner the better, if chronic hotbeds and nursing-grounds of contagion are to be uprooted, and the public health maintained. We have often pointed out that one of the most urgent wants of the town is the erection of a large number of healthy dwellings, not only for the artisan classes, but for the still lower classes of the working population. In London and some provincial towns some advance has been made in this desirable direction; but in Dublin little indeed has been yet effected. There are at present in Dublin an Artisans' Dwellings Company and an Industrial Tenement Company. The former has been a few years in existence, and has erected a number of blocks north and south of the Liffey. We have visited some of those blocks more than once, and though we admit they fulfil some of the conditions of their erection, and are an improvement on the ordinary tenement on the score of health, they do not meet the general want as regards arrangement, space, and rate of rent. The better class, or better-wage-earning class, occupying the rooms in some of these block dwellings, being able to rent more apartments, may feel satisfied; but the rents and spaces are not satisfactory to a class of tenants who are perforce obliged to do with less accommodation. Indeed, there is a class of tenants occupying the rooms of some of these blocks whose places ought to be occupied by their humbler brethren at reduced rents. The commercial principle, of course, is attended to by the company, and we must not talk of philanthropy, though it is quite possible and desirable to blend a little of the latter with the former when the healthy housing of the humble working-man and his family are concerned. We learn that the Artisans' Dwellings Company have about 270 tenements, containing upwards of 1,200 inhabitants. They have erected two-storied cottages, also containing four rooms, and some smaller ones. The larger cottages are let at 7s. 6d. per week, and the smaller sizes range from 3s. 6d. to 6s. The cottages let at 3s. 6d. contain two rooms, a settle-bed, scullery, water-closet, yard, and water supply. The lowest rent, which is 2s., is charged for two rooms in the large houses, but, in addition, it must be stated that separate water supply and water-closet are provided. In the South City, in the old district known as the Coombe, on a site recently cleared by the Corporation, another class of dwellings is being erected. These are on the separate cottage plan, and here about 200 cottages will be provided, and upwards of fifty elsewhere at Manor-street of a similar kind. Two-storied cottages, with sufficient accommodation in each for two families, in certain situations, would be a great improvement on the block or barrack-like dwelling plan. The building of a number of cottages on a quadrangular space, and having a square or open court-yard in the centre, may also under some conditions be judicious in a crowded part of the city. The pure and simple separate cottage plan is the best, and the most neat and appropriate in suburban neighbourhoods. Unlike London, ground is easily obtainable in sundry quarters in Dublin, and the cost of clearing sites in the old quarters of the city north and south would only amount to a tithe of what would have to be paid in London or the suburbs of the metropolis. The large class represented by labourers, porters, messengers, and other miscellaneous kinds of workers, earning from twelve to fifteen shillings per week, are utterly unprovided for in Dublin with house accommodation except of the most wretched and unhealthy kind. The Artisans' Dwellings Company have very few tenements indeed as low as two shillings a week, and in some of the tenement-houses in the city previously mentioned, two shillings have often to be paid for a single room. Several thousands, therefore, of the very poorest of the industrial classes of Dublin are occupying a single room in old tenement-houses, for which they pay a rent varying from 1s. to 1s. 6d. per week. The single rooms in old houses which can be got at 1s. per week are generally filthy and most unfit on the score of health or safety to life and limb. There are several sites in the northern and southern parts of the city which would be available at little cost for the erection of workmen's dwellings, and by the falling-in of leases, the Corporation of Dublin will, in a few months, be in possession of a large district which will be most suitable for the purpose and for opening-up new streets and carrying out other kindred sanitary improvements. The portion of the north-western end of the city, where this land will be available through necessary demolition and improvement, includes a locality, and is joined to others, which for long years have loudly called for sanitary inspection and building improvements. We explored this district years ago, and described its general condition, and we regret to note that much of the evil that produces the high death-rate of Dublin and adds largely to criminal statistics has had its birth in this district or portion of the city.

We must reserve for another paper some further city and suburban notes, respecting work done and undone, and sundry other matters bearing on the social and sanitary condition of the Irish capital.

FORECASTS OF THE CENSUS OF 1881.

THAT disturbance in the position of the centre of population which we recently showed to be in course of operation in London is active throughout the United Kingdom. From day to day fresh facts transpire as to the result of the census; and it will probably not be long before we have at least the approximate total of that vast enumeration. Indeed, the figure of 35,250,000 is already named as that of the total population of the British Islands, and this in spite of a positive diminution in Ireland. But even in England itself that process which has caused such anxiety among the longer-headed statesmen on the other side of the Channel has been partially going on. Eight of the English counties, it is said, show a decline in the numbers of their inhabitants during the decade. The mining industry of Cornwall is shown to be on the decline, and the agricultural districts of Hereford, Huntingdon, and Dorset are also reducing the number of their populations. This is partly explained by the comparison between the census of London and the result of the balance of births and deaths in the metropolis during the last decade. The estimate of the Registrar-General for the population of London by the midst of the present year was 3,707,000, so that fully 120,000 out of the actual population must be immigrants within the decade. If it prove to be accurate that the females throughout the islands exceed the males in the proportion of 18 to 17, one of those features which are held to characterise the physical decadence of a race will be disagreeably prominent.

The general movement of displacement of population, as between Great Britain and Ireland, during the last forty years, may be succinctly stated in a few pointed words.

Since 1841 the United Kingdom has added 30 per cent. of its then existing population to its numbers. This is an increase considerably larger than the total of the population of Ireland in 1841. Since that year, however (the deduction being allowed for in the above statement of increase), Ireland has reduced her population by 38 (accurately 37·95) per cent. So that while the United Kingdom has considerably more than doubled its inhabitants in eighty years (from 16,302,410 in 1801), Ireland, at the present rate of depletion, would eat up or vomit forth her entire population in little more than a century.

THE CLOSING OF THE PARIS *SALON*.

NOT a few of those who have watched in England with any interest the experiment that has been tried this year in Paris, of leaving to the entire body of the artists the management of the annual Exhibition so long known as the *Salon*, formerly under State government, will be surprised to hear that the first year's count of "the new management" has met with what may be considered a perfect financial success. More than 100,000 visitors over last year have passed through the turnstiles of the Palais de l'Industrie in the six weeks the exhibition has remained open, and a very considerable embankment has been obtained after defraying the charges, and by which the artists have been largely benefited.

In London, where what are understood by artistic interests are limited chiefly to the great institution in Piccadilly, it is difficult for people either in or outside society to understand how very generally in all degrees of the upper circles the subject of the fine arts is seriously entertained in Paris, and it is not easy for us on this side of the Channel to comprehend the influence and the significance of the success of this year's artistic experiment, and the direction it may give to the near future of the arts. Fortunately in Paris, although every now and then erratic "cliques" of artists make themselves conspicuous either in true faith or simplicity of feeling, or with the ever-ruling desire for popularity, there exists so strong a faith in the old traditions that the great men,—those who justly acquired their honours,—have always sufficient weight and influence to govern and control the wildest and most outrageous innovations; for even in that city of revolution, conservatism and *Conservatoire*-ism are always alive, though, if one may say so, always progressive.

In the new movement the larger body of artists,—the young artists, as we should call them,—have allowed themselves freely, and with the utmost good sense and propriety, to be led by the men whose work they have long looked up to and revered, and in this way has been secured the friendship, the assistance, and experience of those who have no interest whatever to serve but that of the great interests of art; and in this respect the French artists show their power of adjusting the apparently exceedingly different and uncongenial interests of business and art.

We believe that people have long since given up the idea that artists must be regarded as individuals having no knowledge whatever of the management of what are understood as business affairs. Every now and then stories crop up in England as well as France that show that, as a class, artists are not at all deficient in the occult transactions of the counting-house; the French artists especially show a very respectable ability in adjusting the sensitive character of their artistic pursuits with the more robust machinery of mercantile transactions. In fact, in Paris art has of late years acquired a dignity unknown in the past, inasmuch as many of its most distinguished followers have taken their place on terms of perfect equality, if not with the members of the great Bourse, at least with those of the *petits* Bourse.

What effect all this shrewd acquaintance with business may have on the art of the future some would say it is not difficult to determine; but it is certainly not a little remarkable that, during this "renaissance" of art, in which artists have been and are being so amply remunerated, there are members of the profession whose names are worthy of being ranked with those of the great artists of the past, and who have made themselves prominent and their families affluent. In London, though it cannot be said that the disposition is wanting with our artists to combine the profits of business and art, the ability shown in that direction, it must be admitted, is scarcely as great as it is with their brother artists abroad, for it is not alone in Paris where the business of art is successfully pursued; in whatever artistic seat one may visit, whether it be Rome, Florence, Munich, Dresden, besides a host of minor localities, what is called the life of the poor artist,—that delightful Bohemianism about which we have all read, dreamed, and heard so much,—exists only with the youngest members of the craft. Immediately the smallest success is obtained by the whilom Bohemian, good-bye to the dear old days of struggling study and almost lawless pleasure; good-bye to the artist's hat and the velvet coat, to the mysterious life at the old inn in the forest or by the river-side; good-bye to the stuffy *cafés* in the Quartier Latin; good-bye even to the gardens of the Villa Medici, the *caffé Greco*, and to those hard times that made life so easy and pleasant; good-bye, we have heard some architects say, to the drawing-board and the T-square, for now come the library-table, the diary, the day-book, the ledger, and the cheque-book; a studio in the Champs Elysées, the Parc Monceau or Kensington, a visiting-list, and,—a court suit.

PANTON-STREET, HAYMARKET.

THERE are many old inhabitants of London, and many occasional visitors to the metropolis, who will be able to remember when the Haymarket on certain days of the week,—we think it was twice a week,—presented all the bustle and business of a veritable market for the sale of hay; huge, heavily-laden country wains crowded the whole Haymarket, and the smaller streets adjoining, making the air fragrant with the produce of our pastures. Since then,—it was in 1830 that the market was removed to Cumberland Market, Regent's Park,—the odour of the Haymarket has slightly changed, and of late years it has very justly been considered as a far from savoury spot. Still, throughout its notorious history, it has retained on the eastern side, at least, a high degree of respectability, and the names of Garrard, M'Lean, of Turner and Brecknell, Fribourg, and many others, have bravely withstood, and now may be said to have conquered, the enemy on the other side.

Throughout its history, from the early days of the last century, when the "little theatre in the Haymarket" first obtained the name which, as a term of endearment it has ever since retained, when it was overshadowed by Vanbrugh's (Blenheim Vanbrugh's) big house, afterwards rebuilt by Novosielski, on the opposite side of the way, the Haymarket has been one of the famous streets of London, a street entitled to fame if for no other reason than that it once lodged, it is true at a moment of all but obscurity and certainly of poverty, that master of the English tongue, Addison, an incident in the great man's life which has furnished the brilliant pen of Macaulay with one of his most graphic sketches.

Whether any London authority informs us with exactness as to where stood the house in which Addison resided, we are not aware; indeed, such points are difficult of decision where no exact data exist, and when great changes have occurred. It was a contrast, this Haymarket garret which history tells us Addison occupied, and the home he was to own in later years in Holland House; there was but one point of similarity between them, and that was that they both lay in the fields. But Addison was a man of the world, his sordid surroundings in no way influenced his powers; he had at the time he was writing his "Campaign" travelled abroad, and drank in inspiration from the "classic ground" of Italy, the beauties of which he was to sing but a short time later. Not that the "Campaign" breathes much of the inspired poet. Addison had not then thought of his great work, for work the *Spectator* can be called, though pieced together day by day. If Panton-street cannot be directly connected with that great literary keystone of our language, its neighbourhood,—that, at least, may be conceded,—once sheltered the creator of the familiar characters and the suggestive thoughts that crowd the pages of that cherished work.

Cunningham, in his "London," has entered no mention of Addison's name in his notes on Panton-street, but in his "Modern London" he has inserted on his clue map to the Haymarket the notice of Addison having written his poem of the "Campaign" in a garret in Panton-street.* Taking this for authority, the house he occupied may very possibly have been one of those that have so lately been demolished to make way for the new Alexandra Theatre, a notice and view of which was published in these pages a fortnight ago.

This new "little theatre near the Haymarket" is progressing rapidly towards completion in quiet Panton-street; James-street, at the back, is another quiet seventeenth-century street; the back entrance of the theatre is, indeed, within a few feet only of the old tennis-court, which bears on a quaint label let into its still stout walls, "James-street, 1673," a court which, at the time when Addison lived in the neighbourhood, was in its hey-day of success. It is not, indeed, difficult even now to imagine the noise and gaiety of the game and the even more boisterous fun at Piccadilly Hall, to which the old tennis-court was attached, disturbing the quiet habit of the thoughtful writer.

Of this Piccadilly Hall, a fashionable gaming-house of the seventeenth century, this old tennis-court of James-street is all that remains, and is still easily detected by its appearance, though no longer echoing to the strange jargon of the marker's language; it is, we believe, now occupied by an army clothier. Of the numerous racquet-courts that in the seventeenth century were so popular, it is one of, if not the last, remaining relic, to speak to the generation of lawn-tennis players, of the complicated and antique pastime of our great-great-grandfathers.

As for Panton-street itself, it obtained its name from Colonel Panton, the last owner of Piccadilly Hall. Lord Arundel of Wardour, to whom Wardour-street,—the happy hunting-ground of so many a collector,—owes its existence, married a Miss Panton. On its south side stood Hickford's auction-rooms, the Christie & Manson's, the Hôtel Dronot, or the Clinton Hall of the days of George I.; from a catalogue of a sale in 1728, we learn that a back entrance, on a level with the street, "facing the Tennis-court in James-street," was available for the sedan-chairs of Messrs. Hickford's fashionable patrons. Hickford's, therefore, we see, stood on the site now occupied by the Alexandra Theatre, whose success we may hope will continue to keep alive the memories of this once fashion-haunted corner of old London.

* Pope asked Walter Harte to ascend three pairs of stairs and enter a small top room above a small shop in the Haymarket; when they were within the room, Pope said to Harte, "In this garret Addison wrote his 'Campaign.'"—See "Handbook for London."

BENTLEY PRIORY.

AMONG the pleasant "Homes and Haunts" just now for sale is Bentley Priory, near Stanmore, for a quarter of a century past the seat of Sir John Kelk, and previously that of two successive Marquises of Abercorn, the property having been purchased towards the end of the last century by the grandfather of the present Duke of Abercorn.

Though it cannot compare in literary associations with Holland House, yet under the rule of the Hamiltons the place was frequented by many of the most distinguished statesmen, poets, historians, and essayists. Pitt would often spend a night here discussing his bottle of port wine with his friend, who owed to him his marquisate; "the travelled Thane, Athenian Aberdeen," lived here for many years, being the stepfather of the present duke, and guardian during his minority; the Duke of Wellington, George Canning, Lord Sidmouth, Lord Liverpool, Spencer Perceval, and Sir Robert Peel were all on the list of the Marquis's occasional visitors; as also were Sir Walter Scott, Southey, Wordsworth, and Samuel Rogers. It is said, at all events, by local tradition, that Sir Walter wrote some portion of "Marmion" in a summer-house in the grounds, and that the same peaceful and tranquil scene inspired Rogers with several lines of his "Pleasures of Memory." Lady Morgan, too; Thomas Moore; and the witty Canon of St. Paul's, Sidney Smith, at various times enjoyed here the hospitality of Lord Abercorn.

The Priory has also more than once welcomed royal personages and even crowned heads. Mr. Thorne, in his "Hand-book of London and its Environs," informs us that George IV., when Prince Regent, came hither with the King of Prussia in order to meet Louis XVIII. Thirty years later, namely, in 1848, the house was taken on a three years' lease by the Queen Dowager, Adelaide, but, unhappily she did not live long to enjoy it. She was in very bad health when she took up her abode here, and she survived her arrival only about a year and a half, dying here in December, 1849. Many of the old people remember her gracious acts of kindness and charity among the poor of Stanmore and Harrow Weald, and well recollect her appearance when she took her carriage drives round the neighbourhood on fine afternoons. We believe that the last occasion on which she appeared in public was when she laid the first stone of the new Parish Church of Stanmore, which almost abuts on the edge of the Bentley Priory Estate.

Lord Abercorn, the then owner of the Priory, had made up his mind to reside almost entirely in Ireland, and consequently the place was scarcely inhabited at all for some three years after the queen's death. It was bought in 1852 by Mr. (now Sir) John Kelk, the well-known contractor, who represented Harwich in the House of Commons for a few years as a supporter of Lord Derby and Mr. Disraeli, and was created a baronet in 1874. Two of his sons having died in early manhood, Sir John and Lady Kelk took a dislike to the place where the sons had spent their boyhood; and, having recently purchased a larger property, Tedworth Park, near Andover, Sir John Kelk has resolved to dispose of the Priory.

The estate at present consists of 466 acres, though, owing to the well-wooded and undulating character of the domain, it looks far more extensive. It "lies within a ring fence," being surrounded on every side by public roads; but, in spite of this fact, no mansion in the three kingdoms is more secluded. Indeed, even when you have walked for some distance in the park, the house does not come into view, although it stands on high ground, nearly on a level with the summits of Harrow and Hampstead Heath. In fact, a stranger might easily lose himself in the course of his search for its exact position.

The park, being so surrounded by roads, has no fewer than six different lodge-gates, from each of which the Priory itself is approached by serpentine drives, between large and almost impenetrable shrubberies of laurels, rhododendrons, and other evergreens, among which are several fine yews, the ancient guardians of the spot when it was still a part of the "weald,"—a forest in reality. By whichever gate, however, the visitor arrives, he must enter the house on the northern side, the carriageway passing under an ivy-covered *porte cochère*. Double folding doors open into a spacious entrance-hall, adorned with a groined ceiling, which is supported by fluted columns in the Classical style. On the left of this hall is an inner hall, containing the grand staircase. This is of Portland stone, with carved balusters of oak, of an elaborate pattern of modern design. The handrails are of ebony. It was erected by Sir John Kelk, and is one of the few alterations made in the general arrangement of the house.

The principal rooms into which we enter from this hall are the billiard-room and picture-gallery, which is circular, and lighted by a glass dome from above. This opens, on one side, into the dining-room, and on the other into the chief drawing-room, the latter being 50 ft. by 30 ft., with a painted ceiling, the fireplaces surmounted by large marble mantelpieces, and the panels between and over the doors showing paintings of classical subjects. The library, which adjoins, has also a fine mantelpiece supported by Siena marble columns. On the same floor are two rooms of much smaller dimensions, now called the "morning-room or study," and the "gentlemen's room." These rooms are of especial interest, as they were those usually occupied by the Queen Dowager, who used the former as her sitting-room, and the latter as her bedroom. In the latter there is a recess,—a sort of alcove, such as is often to be seen in bedrooms in France. In this alcove stood the Queen's bed, and here she breathed her last. Her private boudoir was a room on the first

floor, nearly over her sitting-room. These rooms all have a southern aspect, and were chosen by her on account of their warmth and comfort.

It should be mentioned here that from this morning-room a doorway opens to a corridor or vestibule, with steps leading down into an Italian garden, and with an entrance also into a magnificent conservatory, 126 ft. in length, the central walk of which is paved with marble inlaid with tesselated tiles. In this is a fountain for gold fish. The Italian garden and its terraces extend along the entire south front of the mansion.

Beyond the conservatory is a lawn-tennis court or skating-rink, some 90 ft. in length, and lighted by gas, with a raised gallery for spectators at one end. At the western end of all is a lofty clock-tower or campanile, of the Italian style, from the summit of which an extensive view can be obtained, reaching into ten counties.

The great oak staircase, already mentioned, leads up to the "state apartments" on the first floor. These face the south; their windows open on to a broad verandah, commanding a fine view over Middlesex and Surrey.

Below the Italian garden and lawn the ground slopes away rather abruptly down to a lake about four acres and a half in extent, with a boat-house, bathing-house, &c. The sewage of the house and premises is carried by pipes into a small watercourse below the lake.

On the banks of the lake is a summer-house. Here, it is said, that Sir Walter Scott corrected the proofs of his "Marmion," to which he added, at the suggestion of his host, the Tory Lord Abercorn, a couplet, in which he speaks of Fox,—

> "For talents mourn untimely lost,
> When best employ'd and wanted most."

Of these lines, Lockhart tells us in his Life of Sir Walter, that they came actually from the pen of the Marquis; but this can hardly have been true to the letter. It is far more certain that in the adjoining alcove some lines of the "Pleasures of Memory" were penned by Samuel Rogers.

The visitor should not leave Bentley Priory without paying a short visit to the "Cedar Garden," on the north side of the house; he will not easily find one more beautifully adorned with cedars of Lebanon, yews, and other evergreens; and he cannot fail to be struck with the circular rosary and the orangery.

We have said nothing here of the fernery, the lime-tree avenue, and the rustic summerhouse, consisting of two rooms, in the midst of rockery, and evergreens, and ferns. This used to be Queen Adelaide's favourite resort on fine summer afternoons, and in the quiet seclusion of this spot she would sit for hours, reading and working, or conversing with her ladies-in-waiting.

The stables are capacious, containing ten large stalls; besides which, there is another building capable of holding forty visitors' horses.

It must be owned with regret that antiquaries and county historians like Lysons can tell us but little of the back history of Bentley Priory. All that is known of it seems to be that in the days before Henry VIII. there was a priory here, though the order to which its members belonged is unknown. Of course, like other religious houses, it was seized and suppressed along with the rest of the lesser monasteries; its revenues were, however, assigned not to the king, but to the monks of Canterbury. We learn that "in 1543 Archbishop Cranmer gave to the king, in exchange for other lands, the late Priory of Bentley, with all lands, tenements, &c., thereunto belonging in Harrow and Stanmore, being parcel of the possessions of St. Gregory's Priory at Canterbury."

The king, as soon as he got possession of the lands, granted them to two of his friends named Needham and Sacheverel, who sold them a few months afterwards to Elizabeth Colt. We hear little or nothing of the subsequent history of the estate until the reign of Queen Anne, when it would seem to have been in the hands of the Coghills. A member of that family, in 1734, left it to a nephew, who again bequeathed it to a relation of another name. Having passed through the hands of a Mr. Bennett, a Mr. Waller, and a Mr. Doberly, in 1788 it was bought by the Earl, afterwards first Marquis, of Abercorn. It was this nobleman who expended a large part of his Irish and Scottish rents in making large additions to the original house, and made it one of the "stately homes" of Middlesex. Sir John Kelk has left the fabric much as he found it, adding only the projecting Italian central front on the south.

ON THE MAINTENANCE OF PURE AIR IN DWELLINGS.*

THE question of how best to maintain pure air in a house has an important influence in domestic economy, because the health and the vigour of the inmates depend upon their living in a pure atmosphere.

The inhabitants of close rooms, persons who breathe air which has already been breathed, are subject to diseases which may cause death, amongst which may be mentioned pulmonary consumption and certain classes of fevers. But whilst some persons may be killed outright by breathing air which has been polluted by the breath of other persons, the majority are subject to a low condition of health. The reason of this is partly because the oxygen of the air is necessary for keeping in activity the chemical processes which are bound up with life, and that in the act of breathing, that is, in taking air into the lungs, the oxygen in the air is taken up by the lungs and the expelled air is thus deprived of its oxygen; and partly because an individual in expelling the air from his lungs in the act of breathing expels with the air carbonic acid gas, which in large quantities is fatal to life, as well as a large quantity of organic matter, *i.e.* a portion of his body, which latter has a tendency to putrify rapidly in stagnant air, and which may thus become a dangerous poison.

Those who live in a close atmosphere have their vital energy impaired; they are less able to perform work. They more nearly approach to the condition of animals in a state of hybernation; they are less able to enjoy life. There is a case mentioned of a dressmaker who employed a large number of women in a very close room at a low rate of wages. Upon a remonstrance being made as to the condition of the atmosphere, ventilation and fresh air were supplied to the room. The women then complained that their wages were insufficient, because in consequence of the fresh air they were so much more hungry and required more to eat. That is to say, their vital energy was increased; and no doubt their capacity for work was much increased also. The same thing occurred when ventilation was introduced into soldiers' barrack-rooms, through the efforts of Lord Herbert of Lea. The soldiers complained of the insufficiency of their rations, which had to be supplemented.

Mr. Leeds, a ventilating engineer of New York, mentions an experiment which he made with some flies illustrative of this. He confined a certain number of flies in a bottle full of breathed air and tightly sealed up. He also confined a certain number of flies in a bottle through which he allowed fresh air to circulate. The flies in the bottle filled with pure air were very lively, but they all died in twenty-four hours, as they had no food. The flies in the impure air became at once very stupid and could not fly about, but they lived ten times as long as those in the pure air. And thus we find that many poor people living in unventilated houses exist sometimes to quite an advanced age, but they are often sick and feeble. Therefore, when a person finds he cannot earn his living, or if he does earn it he is sure he cannot get sufficient food to eat, he had better imitate the hybernating animals as nearly as possible, and get into some close, unventilated place, and lie down in perfect quiet and repose, and not fret at all, and he will then be able to get along on very little food. But, if full employment is to be made of their faculties, persons must live in pure air.

Stagnant air can never be pure air. There are being given off perpetually into the atmosphere a number of deleterious substances,—the emanations from the breath and other exhalations of every living creature, — the emanations arising from the putrefaction of dead creatures or of decaying vegetable substances, the miasma from marshes, &c. These various poisonous emanations are being constantly changed into non-poisonous forms, or burnt up, as it were, by contact with the oxygen of the atmosphere, which is itself being continually renewed from other sources. The movement of the atmosphere facilitates this burning up of the poisonous emanations.

The atmosphere is always in movement. The Registrar-General gives the average movement of air as measured by an anemometer at Greenwich to be about 17 ft. in a second, or 12 miles an hour. It is rarely less than 6 ft. a second, or 6 miles an hour. Thus, if a single individual be assumed to occupy a space of 6 ft. high by 1 ft. 6 in. wide, situated in the open air, there would pass through this small space in an hour nearly 200,000 cubic feet of air, even when the movement of outer air is as low as four miles an hour.

In order to maintain purity of air in a house, it is necessary to keep up a continual movement of the air, supplemented by a continual change in the air. This movement and change of air must be maintained without causing a sensation of draught. The science by which this is effected is termed ventilation. It is a science of much simplicity in climates or in weather when the windows and doors can be kept perpetually open; but in this climate, especially in winter, the necessary condition of the avoidance of draughts makes it a very complicated matter, and renders it necessary in providing for a change of air to provide also for warming the inflowing air. The great differences of temperature which occur in this country, moreover, produce numerous other complications.

In considering the question of ventilation, the first question which arises is as to the quantity of fresh air which is required for change of air. If it were desired to supply in a room a volume of fresh air comparable with that supplied out of doors, it would be necessary to change the air of the room from three to six times in every minute; but this would be a practical impossibility. And even if it were possible, it would entail conditions very disagreeable to the occupants, who would have to live in a gale of wind. It is thus evident that in considering the condition of air indoors, we have to seek a standard of admissible impurity in the air, rather than a standard of purity of air comparable with what we have out of doors.

In judging of the amount of impurity which may be allowed in an inhabited air space, the sense of smell, when carefully educated, affords the best indicator of the relative purity and impurity of different kinds of air.

The volume of air which is required to maintain the air of a room at a uniform standard varies with the character of emanations given out by the occupants of the room. For instance, the emanations given out by sick persons, and especially those from bad surgical cases, require for their dilution a greater volume of air than is requisite in the case of healthy persons.

Calculations have been made which show that, theoretically, about 3,000 cubic feet of fresh air per hour per individual should be afforded to preserve the air in a confined space at the required degree of freshness; but, in our climate, a careful practical examination of the condition of rooms in barracks and hospitals, judged of by the test of smell, shows that arrangements which appear to provide for a much less amount than that obtained by theoretical calculation, will keep the air of rooms occupied by healthy persons in a fair condition. These results have pointed to about 1,200 cubic feet of air per hour per individual.

This variation from theory seems to be partly due to the fact that there is always a change of air to a certain extent going on in a room. The walls and ceilings themselves allow of a considerable passage of air through them, which is proportioned to the difference between the temperature outside and inside a house, and varies with the materials of which it is constructed. Thus, ordinary bricks are nearly twice as pervious to air as sandstone, and plaster is much more pervious than brick.

If you look at the ceiling, you will see that an old ceiling is blackened where the plaster has nothing over it to check the passage of air, and that where the joists come, and the air has not passed so freely, it is less black. If you break the plaster, you will find that its blackness has arisen from its having acted like a filter, and retained the floating particles of dirt while the air passed through. Ill-fitting doors and windows allow of the passage of a considerable quantity of air.

A sleeping-room is very warm at bed-time; a rapid fall of temperature outside occurs, and at once a considerable movement of air takes place. The majority of occupiers of sleeping-rooms in England close their windows at night; they often block up the chimney by a register or otherwise to prevent the blacks falling. They have no special inlet or outlet for changing the air. In the morning the room would, no doubt, be very close; but if it were not for the continual insensible change arising from the air

* Paper by Captain Douglas Galton, C.B., F.R.S., read at the Domestic Economy Congress, Royal Albert Hall, on the 23rd ult.

passing through the walls, doors, and window-chinks, &c., the occupants would be asphyxiated. A well-built house unprovided with special means for the inflow of fresh and outflow of vitiated air, is a real source of danger. For these reasons the form, position, and surroundings of a building are important, because the air thus insensibly coming in, as well as all other air admitted, should be taken from pure sources.

Rooms with a large amount of outside wall-space have a better chance of obtaining fresh air than rooms whose walls separate them from other occupied rooms; because the air, filtering in from an occupied room, would necessarily contain more impurities than fresh outside air. The inflow of air to a room takes place not only from all sides, but also from below. The air does not cease where the ground begins, but air permeates the ground, and occupies every space not filled by solid matter or by water. Thus, if you build on a dry, gravelly soil, where the interstices between the stones are naturally somewhat large, you practically build over a large stratum of air. This air moves in and out of the soil in proportion to barometric pressure, and with reference to the wind.

The fact of this continual free passage of air in and out of the ground makes it important that the ground we live on should be free from impurities. We might just as well (indeed, probably far better) live over a pig-stye than over a site in which refuse has been buried, or in which sewer-water has penetrated, or over a soil filled with decaying organic matter; because in cold or damp weather, when the air in the dwelling is warmer than the air outside, the upward movement of this warmer air will draw in air to supply its place from the ground on which the dwelling stands. This movement would be prevented if the whole surface under the dwelling were covered with an impervious material.

It has been the custom of many London builders to lease a site, to remove the valuable gravel and sand, and in order to fill up the hole thus caused, to invite people to deposit rubbish, often including foul garbage, on the site; and when the hole is thus filled up, to build a house over it. People are then astonished at fevers and sickness prevailing in new houses.

The size of a room does not permanently affect the purity of air in the room; that is to say, that the number of occupants in a large room being the same as the number in a small room, the same amount of air admitted and removed will eventually keep the two rooms in the same condition of impurity.

The degree of impurity in the air of an occupied room ultimately depends solely on these two things:—

1. The rate at which emanations from the occupants are produced.

2. The rate at which the air of the room is being replaced by fresh air.

The advantage of large space is that the large room is longer in reaching the state of normal impurity than the small room. For instance, the following table shows the time required to bring air to a definite uniform standard of admissible impurity (viz, 0·2 per 1,000 of CO_2), in different sized rooms:—

		H.	M.	S.
One man in	10,000 cubic feet	3	20	0
,, ,,	5,000 ,, ...	1	40	0
,, ,,	1,000 ,, ...	0	20	0
,, ,,	600 ,, ...	0	12	0
,, ,,	200 ,, ...	0	4	0
,, ,,	50 ,, ...	0	1	0
,, ,,	30 ,, ...	0	0	36

But besides this, the inflow and outflow of air necessary to maintain the standard of impurity is less perceptible in a large than in a small room; for the chief difficulty of keeping ventilation in action arises from the draughts it causes. Every one objects to a current of air which affects him, and desires that if a window is to be opened it shall be situated behind some one else. There is, moreover, in practice, this advantage in the larger rooms, viz., that the larger wall surface and the more numerous windows will allow of a larger insensible ventilation, and thus larger rooms will have an apparently less degree of impurity than small rooms. Although the uniform diffusion of carbonic acid is very rapid in the air of a room, the organic emanations given out do not in practice diffuse themselves either rapidly or uniformly. They hang about in corners where there are obstructions to the flow of air, or near the ceiling. On this account, some space between the occupants of a room is desirable. In sleeping-rooms and in hospital wards, and, in fact, in all rooms where the height is above 10 ft. or 12 ft., the floor-space becomes of more importance than cubic space. For adults in sleeping-rooms it is undesirable to have a floor-space for each of less than 50 superficial feet. And the floor-space in dormitories in schools should certainly not be less for each boy or girl than a space of 50 superficial feet, or say 10 ft. by 5 ft. or 6 ft. 3 in. by 8 ft. In hospitals, from 90 to 120 superficial feet of floor space is generally afforded; and in fever hospitals, and in surgical wards, much more floor-space is frequently desirable.

As before mentioned, the ventilation of a room means the removal of a portion of the air in the room, and the supply of a similar quantity of fresh air to take the place of the vitiated air thus removed.

This change of air may be effected in two ways,—1, by forcing fresh air into the room and allowing this fresh air to displace the air already in the room; or, 2, by drawing the air out of a room and allowing the fresh air to flow in to fill its place. In some cases a combination of both methods is adopted.

The extraction of the air is that which is simplest and most generally adopted. The extraction may be effected by fans or pumping machinery, but the usual system is to depend upon differences of temperature for determining the movement of air. The molecules of air are but feebly attracted to each other, and increases of temperature or diminutions of pressure separate the particles from one another. Similarly, decreases of temperature bring the particles nearer together, and thus one cubic foot of warm expanded air weighs less than a cubic foot of cold air.

It follows that as warmed air expands it ascends, and as cooled air contracts it falls. It also follows that as the warmed air ascends the air around rushes in to fill its place. Everywhere this heating and cooling of the air is going on; the sun's rays, the proximity of a warm body, the vicinity of a cool shaded surface, all cause movements in the currents of air.

In a room, as air is warmed by the bodies of the occupants, it ascends; it comes against the glass of the windows, cools, and falls down. Draughts felt near the windows are not necessarily air coming in from the window, it may simply be the cooled air falling. It is on this law of the dilatation of air that all the movement of air depends, from the winds and hurricanes, to the ventilation of our houses, except where we propel air by fans or other mechanical appliances.

The law which regulates this movement of the air in a confined space or a room, when the temperature is higher than that of the outside air, depends upon the following considerations:—

1. Upon the difference of temperature of the air inside the confined space, as compared with that outside.

2. Upon the area of the aperature through which the air passes.

3. Upon the height of the column of ascending air.

Thus velocity of air in a chimney or flue depends on the height of the flue and temperature of the air as it ascends. Therefore, a fire lighted at the bottom of a flue produces a current upwards in the flue. The extraction of air by flues is the plan usually adopted.

The extraction of air by a properly constructed fan, worked by a steam-engine, would be more economical than the flue extraction, especially when the warming of the air, which takes the place of that removed, is taken into account; but the strong recommendation of the chimney is its simplicity and its permanence. It requires comparatively little repair, and no skilled labour to look after it. The convenience of this system causes it to be almost universally adopted. The open fireplace is one example of it; the sun-burner is another example; but the system is also applied in every room in which there is an opening at the upper part, out of which the warm air can pass, and an opening below, through which fresh air can flow in. Thus, an ordinary sash-window is an example. If the top sash is lowered and the bottom sash raised, the warmed air passes out of the room at the top, and the cooler outer air flows in below.

In the open country air is always in movement. In a town the buildings tend to prevent the rapid circulation of air; and, therefore, the smoke from the houses and the impure emanations from stables, from unclean street surfaces, and from ash-pits, hang about and render the air impure.

In a house the space is so sub-divided that air is necessarily stagnant unless special arrangements are made to provide circulation. Of course, in the summer and in warm weather, it is comparatively easy to obtain circulation of air throughout a house, and to fill the house with pure air by opening windows and doors. But in winter and in cold weather or wet weather, when doors and windows are closed, it is necessary to provide special means for creating a circulation of air.

A change of air in a room means that the air in the room which is deteriorated by the breath of the occupants shall be replaced by fresh air. In cold weather it is necessary to provide in some manner for warming this fresh air, or else the temperature of the room would be so lowered as to be injurious.

In most London houses, the ventilation of the room in winter, and the warming of the air, depend on the open fire-place; and there is no better engine for the ventilation of a room. The way in which an ordinary open fire-place acts to create circulation of air in a room with closed doors and windows is as follows:—The air is drawn along the floor towards the grate; it is then warmed by the heat which pervades all objects near the fire, and part is carried up the chimney with the smoke, whilst the remainder, partly in consequence of the warmth it has acquired from the fire, and partly owing to the impetus created in its movement towards the fire, flows upwards towards the ceiling near the chimney breast. It passes along the ceiling, and, as it cools in its progress towards the opposite wall, descends to the floor, to be again drawn towards the fireplace. A fireplace is thus powerful enough to draw into the room all the air it wants, and for this purpose will use indiscriminately all other openings, whether inlets or outlets, if necessary.

The rays from the fire pass through the air of the room without warming it; but they warm the surfaces, on which they impinge, of the walls and furniture, and thus communicate the heat to the air. Thus, in a room with an open fire-place, every object in the room contributes its heating surface to warm the air, which is drawn in cold from the outside by the fire.

But the cold air is liable to produce draughts. The only way to prevent draughts is to adopt means for providing fresh warmed air to supply the place of that removed. This may be effected in various ways. The fresh air may be brought to the back of the fireplace and there warmed by some of the spare heat which otherwise would pass up the chimney. By this means each room would be self-contained, so far as its heating and ventilation are concerned. Or, if preferred, a stove may be placed in the basement of a house, and fresh air brought to this stove to be warmed, and then conveyed by flues in the walls to the several rooms, and then admitted in convenient positions; or else the stove may be placed in the staircase or hall of a house, and fresh air be brought to it to be warmed, so that the staircase or hall shall form a reservoir of fresh air, from which the open fires in the several rooms draw supplies of air through the doors or through special openings.

Any of these arrangements will prevent draughts being felt in the rooms. Wherever an open fireplace is used, there should be some arrangement for the supply of fresh warmed air in winter to replace the air carried up the chimney; but as the fire itself warms the walls, and all the articles in the room, by its radiant heat, it is not desirable that this fresh air should be warmed to any great extent. Probably a temperature of 54° to 56° would be ample, as it would soon acquire in each room the supplemental heat which the occupants would desire. The lower the temperature of the fresh air, the larger would be the quantity of oxygen contained in a given bulk of air. Thus, a person breathes on an average when tranquil 16½ cubic feet of air per hour. A cubic foot of dry air at 32° contains 130·375 grains of oxygen, and with the air at 32° he would receive 2,164 grains of oxygen into his system. At 80° temperature, the air contains only 118·7 grains in a cubic foot, and in breathing 16½ cubic feet of air at 80° he would receive into his lungs only 1,971 grains of oxygen, or only about 90 per cent. of the oxygen which he would inhale at the temperature of 32°. Therefore, the lower the temperature at which air can be supplied

for breathing, consistent with comfort and the avoidance of draught, the better.

There is so great an advantage in the open fire-place as an engine of ventilation for rooms, that although many other and more economical means of heating our rooms have been suggested, it is questionable whether, on the ground of health, it would be wise to give it up.

One great evil from which we suffer in London is the smoke in the atmosphere, and this is aggravated by our open fireplaces, but not necessarily. The smoke is not only an evil in itself, but it aggravates the effect of the fogs which prevail, especially in this country. It seems that the tarry matter given out by the combustion of coal coats over the watery particles which float in the air in time of fog, and thus retards the evaporation, and causes the fogs in towns to be more continuous than they would otherwise be. The fog and smoke are a serious inconvenience to ventilation in London, because ventilation means the supply of pure air. The outside air in London is impure, and the only way to obtain comparatively pure air in the house is to pass the fresh air drawn in through cotton-wool filters. This entails a considerable amount of trouble, as the cotton-wool filter will, in foggy weather, have to be renewed every three or four days. But even on the finest days in London, when the air is what is called clear, it will be found that the atmosphere is loaded with impurities. There is some smoke, much dust, of which the chief part arises from the enormous amount of horse-manure spread over the streets, and many other impurities incidental to a thickly-peopled area. These impurities, and even the fog and smoke over a town such as London, do not rise to any very great height. The tops of the church-towers, and of the loftiest houses, have been sometimes observed to be in a clear atmosphere on days when the streets are wrapped in fog. At the level of the tops of such lofty structures a much purer air may always be found than prevails near the street level, and this purer air could be brought down for the supply of houses. In all public buildings in London, especially in the Houses of Parliament, the supply of fresh air should invariably be from this purer source.

But this question should be looked at from a wider stand-point. The population of London, at the beginning of the century, did not exceed 960,000. It is now nearly 4,000,000. Thus a population not much smaller than that of Portugal, which is spread over 34,500 square miles, is concentrated in London on to 118 square miles. The houses spring up on the outskirts of London on every piece of spare land. Each house contributes to the smoke of London, and this smoke-contributing area, and the inhabited area which contributes impurities to the atmosphere, grow more rapidly than the arrangements made for removing the impurities, or for diminishing smoke.

We have had much legislation upon the subject of improving the purity of our rivers and water-supply, but pure air is as important to us as pure water, and this question has been practically left untouched. There are Acts of Parliament prohibiting smoke, but, unfortunately, these have been left to be a dead letter, because of the private interests which they assail.

Those who live in the country find the pure air come to them on all sides, because of the constant movement which goes on in the atmosphere. Those who live in London must turn their attention to some method of diminishing the impurities with which London air is charged, or of putting in movement the atmosphere so charged with pollution. The first and most obvious step is to relieve the air from the enormous amount of smoke which is now daily thrown into it, and the next is to remove all refuse from the streets and houses as rapidly as possible. As a contribution towards the well-being of the country, each householder should be bound to adopt some method of preventing smoke in his household.

The question of the avoidance of smoke is essentially one which comes under the cognisance of a Domestic Economy Congress, because smoke means waste; the consumption or prevention of smoke is the utilisation of waste, because when smoke proceeds from a fire it shows that a large part of the fuel is going away into the atmosphere unconsumed. There have been many suggestions made to prevent smoke,—the form of the fireplace, the use of anthracite coal, the use of gas instead of coal, or the use of gas in combination with coal.

One of the first persons who turned his attention to the prevention of smoke was Dr. Arnott. He proposed a fireplace which practically produced no smoke; but it had this inconvenience, that it gave a very dull fire. This inconvenience might, however, be easily remedied by a not very great alteration in the arrangements for admitting air to the top of the fuel.

It would be beyond the limits of this paper to enter upon the very large question of the various forms of grates, or of the other means for preventing smoke, and such a discussion would now be premature, as a committee has been formed for the purpose of testing, in the course of the coming autumn, various new forms of fireplaces devised to prevent smoke.

There is scarcely any question at the present day more important to the inhabitants of London than that of devising means to purify the atmosphere. Parliament can make general laws prohibiting smoke, but the enforcement of the laws must rest with the local authorities. In London, unfortunately, the authorities whose duty it is to enforce the existing law have been very supine in the matter; and London suffers far more than ought to be permitted from the smoke of factories and large chimneys. As regards the chimneys in private houses, although each gives out only a small quantity of smoke, the aggregate of smoke contributed by them is as serious an element in the pollution of London air as that from the factories. The source of pollution is beyond the reach of present legislation. It is a matter dependent upon the action of each individual householder. The most serious cause of air pollution in each house may be said to be the kitchen chimney, or the chimney of the hot-water apparatus. These must be in operation winter and summer. There are, however, numerous arrangements for cooking and for supplying hot water which do not give out smoke, and which are far more economical of fuel than the ordinary kitchen grate. The use of these would not affect the comfort or the ventilation of the living-rooms. The use of one or another of these arrangements would entirely abolish smoke from kitchen chimneys, and if kitchen chimneys and fuel used for cooking ceased to give out smoke, the atmosphere of London would be sensibly purer than it now is.

The other cause of impurity in London air,—viz., that arising from dust,—is more a matter for the local authorities than for the individual householder. The streets should be washed every morning, and swept more than once a day; the dust-carts should be covered; dust from dust-holes should not be brought up in open baskets and emptied, as it now is, into the open carts, so as to scatter the largest possible amount into the atmosphere, and in the face of the persons passing by; but dust should be daily collected from every house, and received in closed receptacles, to prevent any of it being spread in the atmosphere.

If the local authorities would set themselves seriously to work to prevent the pollution of London air in this direction, and if every individual householder would take the trouble to adopt some method of diminishing the smoke from his own house, a sensible effect would soon be produced on the cleanliness of London and on the purity of its atmosphere.

A SCOTTISH ARCHITECTURAL EXCURSION.

LINLITHGOW: BINNS HOUSE: ABERCORN CHURCH.

THE annual excursion of the Edinburgh Architectural Association took place recently, and was largely attended. Under the arrangement of Mr. John McLachlan, president, they proceeded to Linlithgow, to examine the remains of the Palace and St. Michael's Church, which is still used as a place of worship. Mr. Kerr, architect, Edinburgh, in describing the palace, noticed that the name, Linlithgow, was of ancient origin, signifying the Lake of the Sheltered Valley, which even now applies to the natural features of the site, which is supposed to have been occupied as a Roman settlement, as pieces of pottery and other remains have been dug up from time to time. In some of the older records reference is made to a chapel, which is believed to have existed here along with some other buildings, as David I. of Scotland occasionally resided here, about 1134. Much reliable information is now available regarding this and other buildings from the Lord Treasurer's accounts and original ancient documents recently published by the Government, from which it appears that Edward I. erected a peel about 1300, and spent Christmas of 1301 here. This peel was taken by stratagem, and dismantled, by order of Robert the Bruce, in 1313, but it appears to have been repaired, and additional buildings erected. These, with the parish church of St. Michael adjoining, were destroyed by fire in 1424, the year in which James I. returned to Scotland, with his Queen. In 1425 he began the erection of a new palace and to rebuild St. Michael's Church. The portions of the palace supposed to have been erected at this time were upon the west and south sides; about 1488 part of the south side appears to have been in progress. In addition to the kings already named, Robert II. and III. resided frequently in the castle or palace. James I. visited it about 1428, and the Royal Family of Scotland occasionally occupied it up to the time of James VI., who left Scotland to ascend the throne of England on the 5th of April, 1603. His son, Charles I., was the last of the Stuart kings who visited Linlithgow Palace. Prince Charles Edward also visited it in 1745, and in the following year it was burnt, when occupied by Hawley's dragoons, and reduced to the state of ruin in which it now appears. The palace forms a quadrangle around an inner court, having high towers, with stairs, at the corners and in the middle of the north side, connected together by lower buildings. The fountain in the centre of the court was erected by James V. about 1538. There was also an outer court towards the south, enclosed by walls at the east and west ends, St. Michael's Church and the outer porch of the palace forming the south boundary. Looking at the building chronologically, the oldest part is the south-west tower, erected by Edward I., and portions of the west and south sides built by James I. The next is the north-west corner, and original part of the north side, erected by James III. and IV.; the latter also built the east side, containing the Parliament-hall and original entrance. James V. is said to have erected, about 1535, a portion of the south side of the quadrangle, built up the principal entrance from the east, and formed that upon the south side of the palace. He also erected the entrance gate-house or porch to the outer court, about 1530. The panels above the gate contained the insignia of the Orders of the Garter, Thistle, St. Michael, and the Golden Fleece, conferred upon him by Henry VIII. of England, Francis I. of France, and Charles V. of Germany The north side, previously noticed, being much decayed, part of it fell in 1607. James VI., although residing in England, retained an interest in his ancestral palace, and had this side rebuilt between 1617 and 1628, from designs by Inigo Jones. The dates 1619-20 appear upon the interior front. King James also made extensive alterations upon the remainder of the Palace, adapting many of the older apartments to the present arrangements. The barbican outside the original east entrance has occasionally been considered to be a part of the castle erected by Edward I., but upon close examination it does not appear to be older than the date of the building adjoining, erected by James IV. The architects or masters of works engaged at the Palace from 1425 to 1467 appear from the accounts to have been John of Walton, Robert Wedale, Robert Livingstone, John Holms, John Weir, and Henry Livingstone. Sir James Hamilton was architect to James III. and IV., and Inigo Jones to James VI. Parliaments were held here in 1388, 1389, 1545, 1585, 1593, and in 1646, when Edinburgh was visited by the Plague.

On ascending to the first floor, the party traversed the several principal apartments. In the north-east corner is a large kitchen, with ante-rooms on the north and east sides. The former communicates with the large dining-room and private apartments behind, extending along the north side of the Palace. The other communicates with the Parliament Hall, which extends along the east side, measuring 98 ft. by 30 ft., with a gallery at at the north end, and large richly-carved stone corbels spaced along the side walls. This apartment, which is lofty, had an open-timber roof. Behind the south end of the hall is a retiring-room, robing-room, and strong-room; from these, extending along the south side, is the chapel, which contained a gallery at the west end, and is lighted by tall windows in the south side, with bold richly-carved stone corbels and canopies upon the intermediate piers. There are also some remains of the tile paving of the

floor. At the west end of the chapel are the hall and priest's chamber, communicating with a corridor towards the inner court. Along the west side is a large room, in which Mary Queen of Scots was born, with stairs from it leading to the apartments above and below. Adjoining the north end is a State council-chamber, James III.'s bedroom, strong-room, and oratory, terminating with beautifully ribbed groined ceilings. The council-room shows the plan of the complete paved floor, composed of tile and indented stone. The upper floors have been occupied as bedrooms and other private apartments. The top of the north-west corner stair is covered by an interesting groined roof, the ribs resting upon carved corbels, with the letters J and M intertwined, being the initials of James IV. and his Queen Margaret, daughter of Henry VII. Over this is a groined turret known as Queen Margaret's Bower, referred to by Sir Walter Scott in the fifth canto of "Marmion", as the place where Margaret retired after her husband had determined to advance to Flodden.

"His own Queen Margaret, who in Lithgow's bower,
All lonely sat, and wept the weary hour."

There is also a stone-paved flat forming part of the roof of the south side of the quadrangle, enclosed by the high sloped roofs at the back and ends, and communicating with the four corner stairs. The ground-floor is occupied at the south-east corner by several kitchens for the domestics and guard, also by a buttery and two guard-rooms. In the one at the entrance from the south the Regent Murray died, on the evening of the 23rd January, 1570, after being shot in the early part of the day by Hamilton of Bothwellhaugh. The south-west tower contains the prison, and the south-east a small stable for the king's horses. Adjoining the old east entrance is a dungeon, also said to have been occupied as a lions' den, but which may have ultimately been converted to another purpose. It is, however, curious to note that in the Lord Treasurer's accounts, there is a charge in 1330 for food to a lion belonging to David II. In 1452, there was a payment to a keeper of a lioness belonging to the king. In 1474, James III. got a present of a lion. There was a lions' den at Stirling Castle, a vaulted chamber in the Palace of Linlithgow, and a "house of the lions" at Holyrood in the time of Queen Mary. From the bottom of the stair at the north-west corner, there is a passage communicating with a door in the north front, leading to the archery-butts and boat-slip at the side of the loch. While viewing these and walking round the Palace, an opportunity was had of observing particularly the details of the masonry and stone-carving, which, except that upon the portion erected by Inigo Jones, shows both externally and inside the Palace a decidedly French character. The numerous chimney-pieces are of stone, of various designs, richly moulded and carved.

St. Michael's Church, adjoining, was next visited. It is still used as the parish church. Although an earlier chapel or church may have existed upon the site, the present building appears to belong to the fourteenth and fifteenth centuries, and is admitted to be an important specimen of an ancient parish church, being of large dimensions, and containing interesting peculiarities in its details. It has been a cross-church, with an octagonal termination to the chancel. The tower at the west end was surmounted by a crown, similar to that of St. Giles's, Edinburgh, which, from fear of its insecurity, was taken down about 1821. The beautiful west door and tracery of the windows are worthy of careful study; the tracery, which at first sight appears Flamboyant, is strictly Geometrical, and no design is repeated on the same side of the building.

Proceeding through a finely-wooded district to Binns House, the property of Sir Robert Dalzell, who kindly granted the necessary permission to inspect the apartments, the ancient family mansion appeared amidst groups of old trees upon the western grassy slope of Binns Hill. The oldest part of the building was erected in 1623, and by the additions made from time to time formed an irregular mass, which has been assimilated by alterations in the castellated style carried out early in the present century. The principal apartments, however, have not been much interfered with, and the panelled wall-linings, doors, and finishings remain, showing the variations in style belonging to the respective periods of the additions. There are also several beautiful plaster ceilings of different designs, converted, in some cases by single mouldings and in others by floriated bands, into geometrical forms interspersed by bold pendants. In one of the rooms a frieze is introduced, filled with fruit and foliage, which has a rich and pleasing effect. There are also some interesting specimens of ancient furniture in good preservation. The collection of family portraits, and others of the Royal family of Scotland, next claimed attention. It was said that some of these had been saved from the flames during the burning of Linlithgow Palace in 1746. When examining the portrait of General Dalzell, who was at the head of the army in Scotland in 1681, and the chief officer in raising the regiment of Scots Greys in that year, it was remarked that the visitors were upon the spot where the regiment was embodied while its two hundredth anniversary was being celebrated in London.

Leaving the pleasure-ground of Binns House, the party directed their attention to Abercorn Parish Church, still occupied as a place of worship. It belongs to the latter part of the Norman period, and is of an oblong form, measuring about 72 ft. in length by 15 ft. in width. The original division of the chancel and nave is shown by a plain-plastered arch, supporting a small bellcot outside the roof. Considerable alterations have been made upon the original church and buildings erected abutting upon its walls, yet there are some Norman features remaining, especially portions of two doorways, one with a zigzag moulded arched head, filled in by a slab with lozenge-shaped ornaments upon the surface. A thick surface of rough-cast over the exterior prevented any further details from being traced, but, in some places where it had fallen off, the ashlar of the original walling appeared. The earth had also accumulated to a considerable height upon the walls, which led to the suggestion that if it was judiciously removed, and the walls cleared of the roughcast and carefully pointed, the church would be rendered more comfortable, improved in its appearance, and would enable any of the old architectural features that may still remain to be readily traced. Notwithstanding these drawbacks, the church has a venerable appearance, surrounded by lofty old trees, laden with exuberant foliage. The interior, as already noticed, is of an oblong form; the pulpit, being placed about the middle of the side wall, has a deep recess in front of it. Although the paving is of plain pine, the pulpit enclosing the rail of the Kirk Session seat, and the finishings of the Hopetoun Gallery, are of oak. The panelling of the pulpit and canopy above are neatly executed. The inclosure of the Kirk Session seat may have been the remains of the altar-rail when the church was used as an episcopal place of worship. It consists of a large base with massive balusters, connected at the top by small arches, which support a broad moulded cope. There is some very effective carving upon the Hopetoun Gallery, which, with the fittings described, appear to belong to the seventeenth century. A peculiar arrangement is connected with the Hopetoun Gallery. There is an outer lobby, from which the gallery and a retiring-room enter; from the retiring-room there is a small well-lighted chamber with a fireplace and an opening in the church wall, through which the preacher may be seen and heard; an invalid or other occupant may thus join in the services without being exposed to draughts or other inconvenience. This may be said to be an elaboration of the earlier hagioscope. In the lobby there is also the shaft of an ancient Celtic cross, which was discovered in 1841 when removing an out-building attached to the church. It is now carefully cleaned and set up, and also suggests the course to be followed should any similar objects be discovered. In the churchyard there is a long gravestone of triangular section, with a longitudinal rising curve, turned up slightly at the ends, and finished upon the sides with rows of overlapping scales. Similar stones exist in other parts of Scotland, and also in England. They have been suggested to be of Scandinavian origin, but the form appears rather to have been suggested from the covering of the ancient bier, and which ultimately developed into the ridged Mediæval cope-stone.

The next place visited was Hopetoun House, which was occupied, but the party were kindly shown round the exterior. It is a magnificent palatial building in the Italian style, consisting of a centre and wings extending forward. The centre was erected about 1700 from a design by Sir William Bruce, the architect for the restoration of Holyrood Palace, and the wings were added in the end of last century from designs by William Adam, father of Robert Adam. The gardens are extensive and well arranged. On leaving, attention was directed to several large and interesting specimens of pine trees, and to the remains of the ancient castle of Abercorn, which was taken and demolished by James II. in 1455, during the Douglas wars.

After partaking of a substantial dinner at the Old Hawes Inn, in South Queensferry, the time remaining was devoted to a short visit to the Norman Parish Church of Dalmeny, of unknown date, but the name of the parson appears as a witness to a charter about the middle of the twelfth century. All then returned home highly gratified with the day's excursion and the admirable arrangements made by their President.

HAMMERWOOD CHURCH, EAST GRINSTEAD, SUSSEX.

THIS building is the church of a new parish, which has been formed, for the most part, from an outlying portion of the large parish of East Grinstead, from which it is fully four miles distant. It stands on high ground, and is a very conspicuous object in this still well-wooded district.

The name "Hammerwood" is derived from one of the old iron forges which were once so prevalent in the Weald of Sussex, and the stream in the valley below the church still retains the dam and mill-stream which doubtless once did duty for driving the forge. This water has long since been formed into an ornamental adjunct to the adjacent mansion.

The church, which is in the English flowing Gothic style of the middle of the fourteenth century (the Decorated), consists of an open nave, divided from the south aisle by a range of arches with circular columns and carved capitals. The chancel opens from the church by an ornamental arch of its whole width. The tower, with spire, is at the east end of the south aisle, and opens into the chancel and aisle by two corresponding arches. The vestry is on the north side of the chancel, and there are two porches north and south of the church.

The whole of the roofs are of open timbering, with arched principals; the seats are of open oak framing, and oak has been freely used for the fittings generally. The passages are paved with tiles, and the windows are filled in with ornamental glazing, by Mr. Brunton, of Kennington. The roofs are covered externally with Broseley tiles. There is a peal of five bells in the tower, which were supplied by Messrs. Warner, of Cripplegate.

The carving has been done by Mr. Davis, and the heating apparatus by Messrs. Berry, of Pimlico. The contract for the erection of the building has been successfully carried out by Messrs. Nightingale (builders), of Reigate, from the design and under the superintendence of the architect, Mr. E. P. Loftus Brock, F.S.A., of Montague-place, Russell-square.

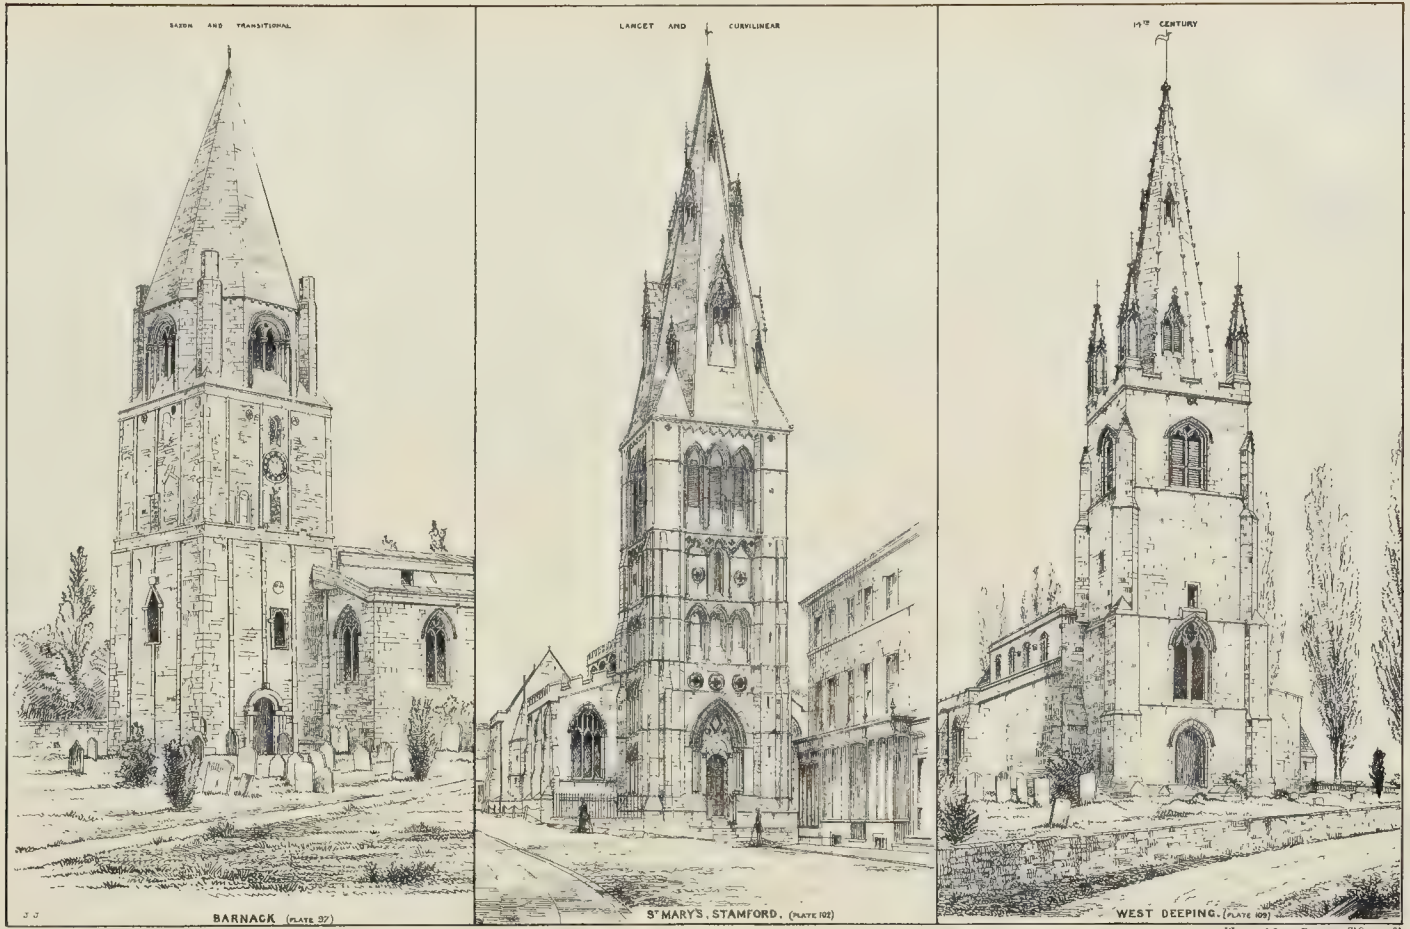
The church has been erected by Mr. Oswald A. Smith, of Hammerwood Lodge and Lombard-street, who has defrayed the whole cost of the building, besides giving the site.

The large east and west windows are filled in with stained glass, by Messrs. Clayton & Bell.

The length of the building from east to west is 78 ft. The spire is 100 ft. high.

The churchyard is enclosed by a stone wall, and is entered by a lych-gate of massive oak work.

DECORATIVE DESIGNS.



THE accompanying design by Mr. Geo. C. Haite for wall-paper is the first of a practical series, illustrating various decorative arts and art-manufactures, which will appear from time to time in the *Builder*. The drawings will be reduced by photo-lithography. All the examples given will be strictly original and of a thoroughly practical kind, especially adapted to the purpose for which they are intended.

The departments it is hoped to illustrate will include wall decoration in its diverse forms, as paper, leather, wood, fabrics, matting, tiles and terra-cotta; ceiling decoration in flat and relief, stencilling and painting; the decoration of furniture, as painting and inlay carving; the treatment of floors in parquetry, wood, tiles, fabrics, linoleum, together with suggestive designs suitable for iron, brass, stone, glass, and other materials.

Wyman & Sons, Printers, Gt Queen St

Such a series will, we believe, supply a want. Patterns already executed and shown as such are of little or no value to manufacturers and professional men who respect *meum et tuum*. Moreover, manufacturers themselves, as a rule, object to the publication of their patterns, since it lays them open to the safe attack of plagiarists and to a certain extent encourages the production of inferior and cheaper imitations, which are thrown upon the market to the detriment of the better class of goods.

The designer will in each case endeavour to explain in a concise form the scheme of colour, the manner of production, and his reasons for the construction and selection of the design whenever it may be necessary.

A WALL PAPER.

This design is intended for the decoration of wall space, and repeats in 21 in. by 21 in., and drops in the hanging, the necessity for which will be at once apparent. The subjects selected are the common nut and sloe, and from their treatment rely almost entirely upon colour for effect; therefore it loses considerably in reproduction in single colour. The scheme of colour is more elaborate than is generally advocated for printed papers, numbering, as it does, in all six colours; but in this pattern, if they are kept well together, the soft and rich glow produced by their means will not at all lessen its decorative value.

The following arrangement of colour is suggested:—Divided into oblong squares of two shades of a well-broken yellow, the darker falling behind the nut, which the designer has endeavoured to convey by dots; one quiet green series for the leafage, a sufficient difference appearing in the nut leaf where the veining is more open; a pale greenish white for nut; dull bluish purple for the sloe; the stems and nut husk in citron; the whole being brought together by an outline of dull brown, which serves for the veining also.

CHURCHES IN AND NEAR STAMFORD.

WE noticed at length in our last number (vol. xl., p. 783) the recently-published book which deals in a very good way with the "Churches of the Nene Valley" (Batsford, 52, High Holborn, 1880), and of a district a little to the north of it. A promise was made that three of the perspective views should be reduced by photo-lithography so as to make up a page illustration for the *Builder*. The perspective views in the book are in number about one-sixth of the 112,—the whole number of the plates,—and are slightly out of the way of the main purpose of the volume, which was to concern itself with the interiors of buildings and with details, rather than with outside and general effect. A few illustrations of exteriors, however, find their place naturally enough,—since they also show what changes in expression and in details were being made between a period well before the Norman Conquest, and the middle of the fifteenth century. The original lithographed illustrations are very fair specimens of transfer lithography. They have been reduced for us to about half their original size in every direction, but still show good draughtsmanship and a light firm touch. The three examples have been selected as being fairly characteristic in their way. Although the intervals between the dates of the work are not even, there is a fair representation of several of the stages between the primitive Romanesque of the very early tower of Barnack and the late Curvilinear work at West Deeping. Of work belonging to intermediate dates, for instance, is the octagon belfry-stage and short stone spire, belonging to the latter half of the twelfth century, put upon and cleverly designed to suit the rude square early tower of Barnack. This view (plate 97) and that of the still more characteristic tower of Earl's Barton (plate 96), will give the possessors of this volume a very good idea of the work which our rude forefathers contrived to erect amid all their difficulties. The west tower and spire of St. Mary's, Stamford, take very high rank among the many west towers and spires of a good stamp scattered liberally over England. The tower is by no means the distinctive fifteenth-century Stamford tower,—appearing at St. John's, St. Martin's, and All Saints',—which will be found carefully described in vol. xxxvii. (1879) of the *Builder* (pp. 692, 693). St. John's is given in the "Nene Valley" book (plate 112). That treatment of the towers came into vogue long after the completion of St. Mary's spire. This spire fits the substructure very well in scale and extent of elaboration; but the tower is much pierced from the base upwards, and the spire has imposed a difficult task upon it for more than 500 years. The extra weight has not been at all easily borne, and buildings-up of windows and arches, iron bands and ties, &c., have been pretty freely indulged in. Through the "wisdom of our ancestors," in the days sighed after as those of rare constructive skill and of honest building, plenty of these little tasks have fallen to the lot of us poor worshippers of the past in these degenerate days.

NEW SCHOOLS, SAFFRON WALDEN.

THE schools we here illustrate by view and plan have been recently erected from the designs and under the superintendence of Mr. Edward Burgess, architect. The building will accommodate 200 children.

The materials used are red brick, with terra-cotta dressings; and tiles on the roofs.

The builders were Messrs. Bell & Sons, of Saffron Walden.

THE CHURCH OF THE "STIFT HAUG," WÜRZBURG.

As we have more than once pointed out, although the Renaissance style was introduced into Germany at the end of the fifteenth century,* yet it was two centuries before it came into anything like general use in the construction of churches. The earlier ecclesiastical edifices erected in this style in Germany are, as a rule, very dignified, and rather severe in character, and possess considerably more picturesqueness of treatment than those of Italy or France. The high-pitched roof and projecting external buttresses of the Gothic are still retained in combination with regular Italian domes and façades. The curious bulb-shaped spire, consisting of a series of lanterns superimposed, and each crowned by an onion-shaped dome, is a remarkable feature of these buildings, and although it may be objected that these spires are unconstructional and eccentric, there can be no doubt that they have a remarkably picturesque appearance, especially when seen in combination with other buildings.

The Church of the "Stift Haug," at Würzburg, is an interesting example of this style, and exhibits all the peculiarities of that particular phase of architecture which we have been describing. The name "Stift Haug" really means "the Establishment of Haug," and is the designation given to a college of priests, of which this was the church. The church itself is dedicated to St. John the Baptist, and was erected between the years 1670 and 1683, under an architect named Petrini, a native of Würzburg, who erected many buildings in that town. The name Petrini certainly has a very Italian sound about it, but Italian names are so common in Würzburg, even at the present day, that it is probable that an Italian colony was established here some centuries back.

The Church of the Stift Haug consists of a single choir, terminating in a polygonal apse to the east; transepts; and a nave of three bays, with chapels instead of aisles. A finely-proportioned dome rises over the intersection, and two lofty towers, crowned by bulb-shaped spires, flank the western façade.

The interior of the building is simple and dignified, and the altars and furniture are in better taste than is usual with buildings of this date, while the organ is really a fine piece of design. The pendentives of the domes rest upon a series of pilasters rather singularly treated.

The church is built of a fine warm sandstone, except some of the plainer portions of the walls, which are of rubble covered with plaster. The apse has rather a Romanesque character about it, and were it not that there is positive evidence to the contrary, one would be led to suppose that remains of an earlier church had been worked into the existing building.

The architect Petrini also erected the magnificent tower of the University Church, the "Julius Hospital," the city gates, and a portion of the castle at Würzburg. All his works have a fine picturesque outline, and the detail is bold and effective, though rather coarse.

* The "Coronation Hall" in the Hradschin at Prague, which dates from the years 1470–1520, is said to be the earliest building exhibiting Renaissance detail in Germany.

ARTISANS' DWELLINGS IN LARGE TOWNS.

FROM A NURSE'S POINT OF VIEW.*

ANY one who knows anything of the condition of the working-classes in the back streets and slums of London and other large cities, does not require to be told that rules of nursing in their entirety cannot be carried out. It is impossible to choose a quiet room with the aspect you would most desire for an invalid, for there is only the one living-room for father, mother, and four or five children. The walls are neither painted nor whitewashed, but "covered with a dirty cheap paper, pasted over innumerable other papers, harbouring loathsome insects," so that on summer nights the poor are often driven from their feverish unrest to seek relief in the streets and sit on the doorsteps, or propped against the wall of the houses until sleep and fatigue again drive them in. The ceilings are only whitewashed at long intervals of years. The grate is what used to be termed a "bed-room grate," one of the most useless for cooking purposes. The window,—there are rarely two,—does not open at the top, or else it opens without a sash-line, so that it must run down to the wooden support when open, or be closed. There are no means of heating water, except by the kettle, which then takes the whole of the fire; no oven for warming or baking any invalid's luxury; no place to keep milk without its turning sour; no water supply,—except the one water-butt, tap, or pump in the cellar or yard, which has to supply for drinking and all other purposes all the lodgers in the house. And it is a common thing in Holborn parishes for one house to contain ten families and between thirty and forty children. All water for cooking, drinking, and cleaning has to be carried up many flights of stairs in vessels so unfitted for the purpose,—a gallon jar with small bottle-neck is the most common,—that the poor practise a more rigid economy with water than can be understood by those who have not themselves gone through the labour of bringing it up, and of carrying the dirty water down, many times in one day. So you will see the hands and faces of the children washed in the same water, and the same soiled water reserved for washing the floor afterwards,—when that operation is gone through.

If this Domestic Economy Congress can carry out all the good they have at heart, we may hope that in the next century tenants will not be found for such lodgings. But in the present day, as has been well said, "working men cannot build their own houses, but must use those that are available. . . . The result being that they are driven into over-crowded courts and ruined tenements," where ventilation and cleanliness, in a nurse's sense, are almost unknown.

The books on Domestic Economy used in schools, that I have seen, are all more or less admirable in their remarks on "nursing the sick," as they are taken from Miss Nightingale's "Notes on Nursing." They give advice on the choice of a sick-room, quiet, pure air, cleanliness, warmth, rest, diet, light, and cheerfulness. Short directions are also given with regard to food, drink, disinfecting, and the qualities necessary in a good nurse. But in none of these books, nor in the schools where they are used, has it been thought necessary to teach nursing like cooking, by demonstration and practice lessons. But we have to remember that children leave school at thirteen, and that a large proportion of them go out to "a little place," where there is no chance of their ever being trained in the service of cleaning "a sick room" and furniture, and of making the bed and changing the linen of a helpless patient.

I would suggest that if nursing is to be one of the subjects for examination according to the New Code, the art of nursing and of keeping a patient clean and free from bed-sores should be taught to the children first by demonstration, and then by practice lessons. I have myself taught quite young children to change the linen, and make the beds of helpless patients,—each child taking it in turns to be the patient, and doing her best to be in such a "helpless condition" that the two children acting as nurses might not have too easy a task in "changing her," as the removal of one set of bed and personal linen for another is termed. In the same way, I and the ladies working under me, as trained nurses

* A paper by Mrs. Dacre Craven, read by her at the Domestic Economy Congress, Royal Albert Hall, on the 23rd ult.

for the sick poor, have taught children how to use certain appliances for the sick, how to clean a carpet,—if too large to admit of removal,—without dust or noise, by means of a wet cloth, twisted round the brush, or itself made into one; how to clean the hearth, to lay and light a fire; and, to older children, how to wash a patient from head to foot, between blankets or their substitute, without once uncovering any part of the body, and without any unnecessary amount of water. But if, as an old nurse who has given the best part of her life to learning her profession, I may be allowed to give an opinion, I do not think that lectures or books can ever give this teaching.

Again, with regard to ventilation, it must be remembered that the artisan class in London is a moving body. Every clergyman will tell you of the difficulty he has to encounter from his parishioners constantly moving from one district or parish to another. It is, therefore, useless to recommend ventilating valves, &c., which could not without too great expense be removed from one lodging to another. The only ventilation practicable for the working-classes in lodgings is natural ventilation,—that is, ventilation caused by the ascent of heated air and the descent of cold. Architects, as a rule, made no provision in former days,—they rarely do now!—for the air which is to feed the chimney. An ordinary fire, as you all know, draws about 150 cubic feet of air per minute, and in the absence of any provision for the admission of air, and with the window shut, the supply of air must come from irregular sources, viz., from window chinks, through the keyhole and crevices in the door-stead, skirting-boards, and floor-boards,—these irregular streams of cold air passing for the most part horizontally towards the fire, and chilling the occupants of the room not in bed. The more furnace-like the fire the stronger the cold draught, but a very moderate opening in the window will stop all irregular draughts, the air taking the easiest course. By holding a candle at the keyhole of a door you can test whether sufficient air is admitted by the window; for, if so, the flame will burn in repose, and the horizontal draught can be converted into a vertical one by a board or cloth, 6 in. or 8 in. high, fixed about 2 in. from the window.* I think children might be taught this, and also the Canadian system of ventilation, where windows will not open at the top, of opening the lower sash and filling up the space (temporarily) with a folded towel or cloth, until a piece of wood could be made to fit well in under the lower sash, thus allowing a supply of air to come in between the two sashes without causing a draught or strong current of air to blow down upon any one near the window. They should also be taught that it will keep a room fresher and cooler, even in hot weather, to have a very small fire burning in the grate, or a lamp, so as to keep the air from stagnating by making a current of air towards the chimney. They could be taught by demonstration how to make "outside blinds" with the common window-blind, two sticks, and some tapes, so that cooled air could enter the hot rooms in crowded courts and alleys. We have found the sick most grateful for this in St. Giles's and Holborn.

Children might also be taught how to "ice milk," soda water, or any cooling drink for the sick, by wrapping the vessel containing it in a wet flannel and standing it in the sun; how to filter the foulest water by means of a common flower-pot with a piece of sponge in the hole at the bottom and two inches of charcoal over it, and then two inches of clean sand,—the pot to be placed over whatever vessel is to contain the water when filtered; how to wash and dress a baby—by means of a china doll; and how to give a warm bath to a child with croup. In the books of instruction, it is always said "Give a warm bath immediately," but in not one instance are instructions given that no baby or child should be put into a bath which is too warm for your bared elbow to feel comfortable! nor how, when the child is in the bath, boiling water may be gradually added by keeping the water in the bath always moving with one hand until its temperature has been raised to over 100° without the slightest pain or inconvenience to the child.† Children might further be taught that on coming out of such a bath, a warmed blanket should be thrown round the baby; that he should be put to bed and covered with extra blankets to encourage free perspiration, for an hour at the least, and then thoroughly dried and dressed as usual for bed. All children, moreover, ought to be instructed practically how to drop oil into the ear to get things out; and, theoretically, such simple things as bathing the eyes with vinegar to nullify the effects of quick lime, and so preserve sight, which would be lost before surgical aid could be found. But to teach children how to diagnose diseases and how to treat them, is to multiply the already large number of women who think that "quack doctoring" is nursing.

In conclusion, I would again urge that nursing, like cookery and cutting-out in needlework, should be taught practically, and that means should be devised for giving special instruction in these subjects to elder girls in night-schools.

* Mr. F. Hinckes Bird, on "Costless Ventilation," *Builder*, 1862; Mr. T. Pridgin Teale, on "Dangers to Health," 1878.

† I know of two instances, one quite recently, where children have been scalded to death from ignorance of "how to give a hot bath."

AN ITALIAN EXPORTER.

AT the banquet given last month to the exhibitors in the National Exhibition in Milan, the one who claimed most attention was he who, as the Syndic Berlinzahi termed him, was "the typical man of modern times,"—he who should be the model and beacon of national labour for exportation, — the Commendatore Francesco Cirio, of Turin.

At the Exhibition of Milan he is to be found as the exhibitor of preserved food of all kinds, shown in a monster pavilion, with two others adjacent, of all kinds of milk produce and eggs. Then in the gallery where all comestibles are found,—in the department of materials for building purposes, among the machinery, and even among railway works, with his refrigerator wagon, after the American Teffney system, corrected and perfected to meet the especial exigencies of exportation from Italy of alimentary merchandise.

This extraordinary commercial enterprise of exporting alimentary productions from Italy is not more than ten years old. Signor Cirio was before 1869 an *employé* on the North Italian Railway, and is by birth a Piedmontese,—the people of Italy who possess the quality of perseverance and industry in the highest degree. In December, 1869, Cirio sent off from Naples his first large wagonful of cauliflowers,—the first time any exportation of Italian vegetables had ever crossed the Italian frontier; in 1870, a few wagon-loads of vegetables; in 1871, sixty wagon-loads, containing, 3,655 quintals, exclusively of vegetables; in 1880, 4,519, with a load of 386,903 quintals. The medium of the load of each wagon in 1871 was six tons; in 1880, nine tons.

From 1870, Cirio had carried out all his plans alone, uninterrupted by any opposition; but by 1880 he had to battle against all the opposition and hostilities always attending successful speculations; but to his own personal activity, perseverance, and indomitable courage is he indebted for the grand success attending all his operations. Every fourth year a new impulse and development of his plan were seen. In 1871-72 he confined himself to the exporting of vegetables to Austria, Hungary, and Russia. In 1873-74 he began exporting fruits, first in small proportions (twenty-five wagons in all), not only to the above countries, but to Holland, Belgium, and England. In 1876 he undertook to export eggs and butter; and from 631 wagons sent in 1875, he, in 1876, reached the number of 1,188, with a load of 18,000 tons weight. In 1877 he began to send to France, beginning with the exportation of fresh fish, especially trout, taken from the Italian lakes. The price of the lake trout quadrupled, and many, following his example, drove flourishing trades in fish exportation.

Independently of these operations, the expediting of butter and cheese from Lombardy, &c., was carried on with great vigour. In this several influential men from Verona and other places joined him, forming a large company. At the commencement the introducing Italian eggs into the English markets met with great opposition; but by degrees the difficulties were overcome, and now one house alone in London employs 120 horses to distribute Italian eggs in the various parts of the metropolis.

By the exporting of eggs, fowls, and pigeons, Cirio has given an impulse to a modern branch of domestic industry, the development of fowl culture, by which the small farmer can benefit greatly, and secure therefrom a moderate annuity. The cultivation of vegetables and improvement also has been stimulated, and he himself has, at great expense and against great opposition, possessed himself of lands where he has given example of the possibility of improving the vegetables and fruit by introducing all the modern suggestions and means used by other countries.

Another of the branches of commerce undertaken by Cirio & Co. is the preserving of fruits and vegetables, which is carried on to a perfection hitherto unknown. For the preserving of fruit Cirio has set up an immense establishment at Turin, where, besides vegetables and fruit, fowls in jelly, and, above all, the truffles, are famed for the preservation of their exquisite taste.

In Rome, Cirio has formed a company for exporting Roman cement, and by means known to himself, he has been able to export ten tons of cement in a form that when required for use, by mixing it with nine parts more of common sand, the same effect is produced as by the pure Roman cement, thus saving the expenditure of carriage.

SOCIETY FOR THE PROTECTION OF ANCIENT BUILDINGS.

THE fourth annual meeting of this Society was held on Friday, the 24th ult., at the Westminster Palace Hotel, his Excellency the Hon. J. Russell Lowell, the American Minister, in the chair. There was a large attendance.

Mr. Newman Marks, the secretary, said that letters expressive of inability to attend the meeting had been received from (amongst many others) Mr. James Parker, the Marquis of Salisbury, Professor Robertson Smith, Sir John Lubbock, Mr. Alma Tadema, R.A., Mr. H. Stacey Marks, R.A., the Rev. Canon Greenwell, Dr. Birdwood (of the India Office), and Mr. Samuel Huggins. Mr. Huggins wrote:—

"I am pleased to find that the United States, by her Minister, is to take so prominent a part in the proceedings, which will have a good effect on the British mind, as it tells a tale of the association, in the American mind, of 'Fatherland' with ancient edifices, which I believe is general among the cultivated classes. I remember the bitter disappointment always manifested, as I was credibly informed, by American visitors to Chester during the restoration of the cathedral, and their invariable charge to the *cicerone*, 'Don't let them touch the cloisters!' (the feature of the cathedral generally considered the most beautiful)."

The Chairman, in opening the proceedings, said it was not an English characteristic to shift the burden of responsibility upon other shoulders, nor had that been the method by which the English race had achieved such an eminence,—he was almost going to say pre-eminence, — in the world. He had almost imagined, however, that some such desire had manifested itself when he was asked to preside over a meeting for the conservation of ancient buildings,—and primarily, he supposed, for the conservation of ancient buildings in England. If that had happened in an age when inanimate things still possessed the gift of speech,—in an age when Imagination still sat by every chimney-corner and played a leading part in the tragi-comedy of life,—he should have expected to hear addressed to him words something like these proceeding from the walls of the old buildings,—"What have *you* to do with *us*?—*You*, a man of the New World,—a child of Yesterday, even though you flatter yourself that you are going to be the father of To-morrow,—you, who congratulate yourself on having cast off the burden of Antiquity, and on having liberated yourself from the mortmain of the Past,—what have you to do with us?" His venerable friend, in thus appealing to him, would recall to his mind a little adventure he once met with while walking out of Boston, in New England. The road was covered with ice and snow, and a little boy had fallen down, and began to cry. He went forward to commiserate with the child, who, as soon as he heard his voice, said, suppressing his tears, "Well, and if I am hurt, it is not any of your business!" He confessed that seemed to be a thoroughly English answer,—an answer quite characteristic of a race of people who set a higher value upon an ounce of pluck than upon a hundredweight of sentiment; but at the same time it showed that in whatever else a people changed if they went beyond the sea, they did not change their blood, still less did they change in those mysterious influences drawn from a remote source which kept alive the characteristics of race. He felt that the little Boston boy of whom he had spoken, and

millions of others like him, had a claim to their share of the achievements of the English race, and accordingly he did not feel that he was out of place in presiding over the meeting. Strong as were the ties of blood and language, those of tradition were still stronger. Americans and all other English-speaking peoples looked upon England not only as their metropolis in the old sense of the word, but they looked upon it as their muniment-room, where were preserved the archives of the race,—whether on parchment or paper, or whether recorded in stone. The ancient buildings of England were as much the archives of the Americans and of the whole English-speaking race as they were those of England herself, and he was proud to be able to say that a countryman of his had so thoroughly studied those archives as to have become the best archæologist and genealogist now in England: he referred, of course, to Colonel Chester, on whom he was glad to see that the University of Oxford had just conferred honour. America had contributed directly on more than one occasion towards the conservation of English monuments, and on other occasions she had contributed indirectly to the same end. As an instance of such indirect contributions he referred to the case of the house in which Shakspeare was supposed to have been born, and as to which nothing but the fear that the enterprising Mr. Barnum would purchase the house and remove it to America terrified the English people into subscribing 3,000*l.* for the purchase of the house and its preservation. The American people had naturally a very direct interest in the question of the protection and preservation of the ancient buildings of England, and if they were not themselves distinguished for their beautiful monuments, that was all the more reason why they should devote all their energies to the preservation of beautiful monuments that had been built by other people. They protested against the restoration of old buildings because the hand of the restorer was far more destructive than that of decay. He was not sure that he could go so far as those enthusiasts who would rather that an ancient building should tumble down and become a mass of ruins than allow anything to be done to preserve it. But it was possible to keep a true mean course between effacing restoration on the one hand, and destructive neglect on the other. The title of the society was, he thought, exceedingly well chosen as expressive of its objects, and those who supported it and carried it on had the sympathy and moral support (and he thought, if need be, they might count upon the material help) of every cultivated man on the other side of the water. It afforded him great pleasure to preside over the meeting and to do anything he could to forward its objects.

Mr. William Morris then read the fourth annual report of the committee, which commences with the following paragraph:—

"The Committee have been steadily at work at the business of the Society since we last met together; they do not doubt that its principles are being more and more accepted; but the fact must be faced, that ignorance and thoughtlessness are so busy, and are so entirely unchecked by any more direct influence than that opinion of cultivated men of which they know little or for which they care little, that the destruction of the art and history of our ancient monuments is still going on with terrible swiftness, both in this country and elsewhere; and unless those who really care about the preservation of these treasures bestir themselves, and sacrifice some time and money to furthering a distinct agitation against restoration, it will not be long before there will be no ancient building which can be looked on by men of sense and knowledge without suspicion and discomfort; and very few which will be able to sustain a claim to be considered as ancient buildings at all. The very list of those buildings for whose protection the Society has interfered shows how swift the destruction is that is going on at one end of the line, while we are laboriously building up a public opinion at the other end."

The report went on to describe in detail the action which had been taken by the committee with regard to the proposed restoration or destruction of ancient structures. Reference was made to the proposed widening of Magdalen Bridge, Oxford,—a step which the committee assert to be wholly unnecessary as well as destructive of the beauty of the bridge; to the fall of the tower of St. John's Church, Chester, owing to "the neglect of the advice given by the committee" in reference to the building; to Wimborne Minster, Ashburnham House, and other buildings, some of them in Italy.

The Hon. Percy Wyndham, M.P., moved the adoption of the report.

Mr. Reginald Stuart Poole, in seconding the motion, urged the Society to make strenuous efforts to save the Arab monuments of Egypt from destruction. Those beautiful monuments were now being most cruelly despoiled. He was quite sure that Professor Maspero, who had succeeded the illustrious Mariette,—too soon taken from us,—would be most ready to receive the co-operation of Englishmen and Americans in saving the priceless Egyptian and Arab monuments under his jurisdiction. The Egyptian monuments were really documents of priceless value, and only now were they beginning to be understood. Very frequently the damage that was wrought by tourists and others rendered meaningless, and caused to be lost for ever, inscriptions possibly of the highest historical value. In the Arab monuments, on the other hand, was to be seen a sequence in the development of the style corresponding to the progressive changes in Gothic work. This art had never been properly studied, but it was capable of teaching us some valuable lessons in the way of decorative work.

Miss Amelia B. Edwards, in supporting the motion, described the destruction going on amongst the monuments of Egypt, not only at the hands of the *fellah* and the tourist, but at the hands of the *savant*. An army of destructive agents, moved by cupidity, by curiosity, by the mere spirit of mischief, and aided and abetted by a spirit of lazy utilitarianism, was doing its best to make a *tabula rasa* of the history of Egypt as contained in the monuments of the country. The pyramids were being used as quarries, and the paintings on the interior of the tombs were being damaged by the smoke and grease from the bunches of candles which were used as torches by the tourists,—who were the most destructive agents of all, many of them carving their names or initials with the view of going down to posterity in company with Rameses the Great and Thothmes III., or possibly, as a great authority had said, in order to show that a fool once passed that way, and did what mischief he could. Miss Edwards went on to urge that serious representations should be made to the Khédive with the view of securing better protection to the monuments of Egypt. The Khédive and his Ministers were very jealous of the good opinion of Europe, and it would not, she thought, be in vain if some serious remonstrance were made against the continuance of the destructive work that was now going on. She was sure that Professor Maspero would be glad to have his hands strengthened in the matter. He was very desirous of being able to effectually interpose against the Vandalism now going on. He would probably pay a visit to this country in August next, and it would, perhaps, be possible for the society to confer with him on the subject.

Professor Sheldon Amos also supported the motion, and confirmed the statements made by Mr. Stuart Poole and Miss Edwards as to the destruction now going on in Egypt.

The motion was unanimously adopted.

Mr. George Howard, M.P., moved the following resolution:—

"That this meeting, while strongly deprecating the practice of so-called restoration, feels deeply the necessity of urging on all guardians of ancient buildings the duty of keeping them in good and substantial repair, a duty which this Society has on so many occasions striven to put before them."

He said that while sympathising with all that had been said as to the monuments of foreign countries, it should not be forgotten that the society had an important duty to fulfil in this country. He lamented that the clergy, the universities, and the architects were against them, but it was their duty to press on the work they had undertaken, and not to be disheartened at only partial success so far.

Mr. C. Kegan Paul, in seconding the motion, said he hoped the society would keep its eye on Wimborne Minster, which had already suffered seriously by restoration.

Mr. William Morris supported the motion, and spoke with regret of the havoc that had been made by Balliol and other colleges in destroying ancient buildings in Oxford. After speaking in strong terms of the proposed modernisation of Magdalen Bridge, he concluded by complaining that the society was not so well supported pecuniarily, even by its professed friends, as he thought it should be, considering the importance and extent of its work.

The motion was adopted.

Lord Houghton, in moving a vote of thanks to the chairman, said he could not but feel that there was something touching in the circumstance of that meeting being presided over by a distinguished citizen of that great country against which the only thing that could be said was that it was not very old. He had heard Americans speak of the old Walls of Chester as almost revealing to them portions of the old story of Biblical history. Chester was the first walled town that they ever saw, and by its means they were able to realise more vividly than would otherwise be possible the Biblical stories of their childhood. He was sure that any injury to the Walls of Chester would be viewed as a national calamity in America. With regard to the general objects of the society, one reason, perhaps, why they were not better understood and why they evoked criticism, was that in many old buildings it was almost impossible to draw exactly the line of preservation so as to prevent decay, and, at the same time, to preserve to the building the totality of its interest. In conclusion, his lordship urged the formation of local committees or societies in connexion with the society.

The motion was seconded by the Hon. R. C. Grosvenor, and carried with much applause.

Mr. Russell Lowell, in acknowledging the compliment, said that, however much the political divisions of race might be separated, the historic continuity of the race would be maintained by the existence of its monuments. He considered no monument insignificant; none could be, because it might have some feature or some special circumstance connected with it, making it, as it were, a round of the ladder by which we could climb back to our historic past. The society was engaged in the performance of the office of a watch-dog, and it was of much less importance to know into how many calves the dog set his teeth, than that it should be known that there was a watch-dog on the premises.

SANITARY PLUMBING.

TRAPS AND TRAP VENTILATION (CONTINUED).

MR. HELLYER delivered the fourth* of the course of six lectures to working plumbers, undertaken by him under the auspices of the National Health Society, on Tuesday evening last, in the Hall of the Society of Arts. Mr. Noble Smith presided, and there seemed to be no abatement of the interest taken by the large audience in the lectures. The one now reported was illustrated by a large number of diagrams, and by practical experiments with traps of different forms made of glass so as to show whether they were or were not self-cleansing, and whether or not, under given conditions, they could be syphoned out. The lecturer was frequently stopped by questions which, while interrupting the course of his remarks, at any rate showed that the plumbers composing the audience were brimming over with a desire to learn, if not to criticise. The feeling seems to gain ground that an evening or two should be set apart for discussion of the subject at the close of the course of lectures.

Mr. Hellyer, in commencing his lecture, said that on that evening he ought, according to the programme laid down, to be entering on the discussion of the subject of "Soil-pipes and Waste-pipes," but he had been unable, in his last lecture, to exhaust the subject of traps. He had already considered the D-traps and bell-traps,—the two characteristic non-cleansing traps. There were many other traps which befouled themselves in use, but he only wished to speak of traps of that class which were used outside buildings, *i.e.*, in connexion with drains,—before passing on to consider self-cleansing traps. Some might think that such traps were outside of his subject, but in his opinion the plumber's knowledge ought to cover the whole area of house drainage, and ought certainly to extend to the sewer or cesspool. The first of the stoneware traps to which he would invite attention was the Mansergh trap, which, although only introduced within the last few years, had had an extensive sale, and was much liked by many. Nevertheless, he, the lecturer, condemned it,—firstly, he said, because it was non-cleansing; and secondly, because it did not leave the end of the waste-pipe discharging into it open to the atmosphere. It was not only non-cleansing, but dirt-holding; for in use it must form itself into a "collecting-box," as there were in it no fewer than eight corners in which filth could accumulate. No amount of water sent through such a trap could be made to scour the parts fouled. The bottom was flat, the sides

* For reports of previous lectures see the *Builder*, vol. xl., pp. 651, 711, 775.

were vertical; the partition dividing the two compartments was upright, and the area of the surface-water of the trap was several times greater than the inlet or outlet, so that the standing water of the trap, with its decomposing matter, could not get changed by any single flush, nor even by many flushes, sent through its inlet. The bad air from this body of contaminated water, if it did not escape through a waste-pipe into the house, would at times get in at the window or door when near it. The arrangement of the inlet was bad, as it water-locked the discharging end of the waste-pipe, instead of allowing it to be exposed to the atmosphere. There was another evil in connexion with that trap, viz., that the waste-pipe being trapped at its outlet end,—*i.e.* the remotest end of the pipe from the sink or fitting,—would expose the house to any bad air or decomposing matter left in the pipe. In a trap which he (the lecturer) designed some years ago for receiving waste-pipes and intercepting them from the drain, there were three dips or air-barriers, to prevent drain-air reaching the ends of any waste-pipes discharging into the waste-receiving compartment. Like the Mansergh trap, it had two separate bodies of water. It was specially constructed for receiving waste-pipes from baths and lavatories when the latter were fixed on bedroom floors, and for protecting them from the drains, which it most effectually did. The trap had two important advantages over the Mansergh-trap. First, it left the end of the waste-pipe discharging into it open to the atmosphere. Secondly, the bottom of the trap was rounded, and its configuration made it easier to cleanse. But that trap was not self-cleansing, or, at any rate, not so much so as he should like it to be, for an ordinary flush or flushes sent through it would not cleanse it. Now, when a trap could not be thoroughly cleansed, and the whole of the water standing in it changed, by a good flush of water sent into it through its waste-pipe, it ought never to be used, and so, though he held the patent for the trap of which he had last spoken, he condemned it. The well-known gully-trap was now being used for receiving waste-pipes from sinks, &c., but he did not wish plumbers to be "gulled" into its use for such purposes. It might be a good trap for catching *detritus*, and, therefore, just the trap to use in yards and streets for surface drainage, but as traps for receiving the discharges from waste-pipes were not wanted for catching (in the sense of holding) anything in the shape of decomposing matter, the gully-trap was not the right kind of trap for sink, urinal, or lavatory wastes. It formed a catch-pit for filth and decomposing matter, and no ordinary flushes of water sent into such a trap would cleanse it. There were other traps of a non-cleansing character for disconnecting waste-pipes from drains, but which he had no time to stop to examine, as he must hasten on to consider the much-used drain syphon for trapping off sewers. That trap, being a round-pipe trap, would be self-cleansing if it had no "manhole," and if it were provided with means for a waterfall into it. Never, or very rarely, was any pressure of water brought to bear upon the standing water of the trap, and, consequently the latter never got properly changed by a flush of water; while the man-hole or "inspection" hole was a collecting-place for filth. Another evil in connexion with this trap was its want of ventilation, *i.e.*, it had no provision, on its inlet side, for ventilating itself or the drain with which it might be connected. He had dwelt upon the non-cleansing class of traps and severely criticised them, because he considered that bad trapping meant bad drainage, —certainly good trapping was absolutely necessary to good drainage. If perfection in the sanitary arrangements of a house were desired, attention must be paid to every detail, for, however well planned the plumbing and drainage might be, it would not be sanitarily perfect with non-cleansing traps under the fittings inside the house, or with filth-collecting traps on the drains outside,—*i.e.*, round about,—the house. When foul matter was discharged into a trap, it should pass through it as dreams through the brain, leaving no substance behind. Certain traps, which he called self-cleansing traps, would do this. The principles on which such traps were constructed, and the conditions under which they should be fixed, were,—1. The trap should be free from all angles, corners, and places where filth could accumulate. 2. A free-way should be made for the discharges to pass through the trap without breaking their form, — *i.e.*, the traps should be like a round pipe, so made or bent as to form a water seal, thus O. 3. The body-part of the trap, for fixing in horizontal pipes or drains, should be smaller than its inlet, so as to hold as small a quantity of water as possible consistent with the position in which it was to be placed and with the work which it would have to do, and so as to admit of the water being changed every time a flush was sent through it. 4. The minimum-sized trap should be used, consistent with circumstances, but governed to some extent by the size of the waste-pipe or drain on which it was fixed and by the flush of water likely to be sent into it. 5. The water-way into a trap should be larger than its body-part, or than the waste-pipe with which its outlet might be connected, so as to be able to allow of efficient water flushes being sent through the trap to cleanse it and to cleanse its waste-pipe. 6. The inlet or mouth of the trap should always be so arranged that the water flushes should fall upon the standing water of the trap with a vertical pressure, so as to drive everything foreign out of the trap, and to entirely change its previous contents. 7. The *inlet* side of all traps fixed upon drains outside the house should be open to the atmosphere, so that any bad air rising from foul matter decomposing in the trap or coming through it from the drain or sewer might readily pass into the open air or be largely diluted with fresh air before passing into any waste-pipe, soil-pipe, or drain discharging into such traps. In cold countries, where the water standing in the trap would be liable to freeze in severe frosts, the mouth of the trap should be sealed over, and the foot-ventilation or air-induct should be taken into the waste-pipe, soil-pipe, or drain some little distance away from the standing water of the trap (to prevent the cold air currents playing upon it and freezing it). In this country, in sheltered places, there was little risk, and if the trap (for disconnecting waste-pipes, soil-pipes, or drains) was kept well down into the ground in exposed places, there was no danger from frosts, though in severe frosts it was as well to throw a little straw over the grating of such traps. He had only heard of one such drain-disconnecting trap being frozen during the last severe winter out of hundreds that he had had fixed, scores of them, from circumstances, having their standing water within 15 in. of the ground level. Having shown by ocular demonstration that round-pipe traps are self-cleansing, the lecturer showed that such traps were syphoning traps, and especially when they had long vertical legs attached to their outlets. They were often called "syphons," and were so, in fact, under given conditions. Unless syphonage could be prevented, such traps would not only be useless, but dangerous. Though the D-trap and the "Bower" trap were not syphoned with anything like the ease with which syphon-traps could be, they were by no means proof against the action of discharges through the pipes on which they were fixed. Syphonage of traps could easily be prevented by ventilating the traps. A great deal of ignorance prevailed on the subject of ventilation of pipes and traps, and that, too, among men who considered themselves sanitarians. Many of them simply ventilated the main waste or soil-pipe, but did not ventilate each individual trap. They insisted upon the soil-pipe being carried up full-size to the open air, and in some cases they were willing to give it foot-ventilation, but no stack of waste-pipe or soil-pipe was properly ventilated which was not exposed to the atmosphere at both ends, and which had not, in addition, each trap ventilated. Bends in air or ventilating pipes, when made full-bore, made but a trifling difference in the ventilating capacity of the pipes, and it was therefore better to let such air-pipes follow the lines of the building, to a reasonable extent, than to stick up a hideous straight pipe, like a scaffold-pole with struts to support it. The lecturer pointed out that Mr. Pridgin Teale, in his book on "Dangers to Health," though he showed some valuable improvements on old plumbing practices, recommended an arrangement of bath and other wastes by which the water could easily be syphoned out of some of the traps, which would thus be not only useless, but dangerous. Plate II. in that book showed such a faulty arrangement. Having referred to numerous other diagrams and made several experiments in illustration of his remarks, the lecturer, in concluding, observed that those of his hearers who desired to push their inquiries farther would doubtless have an opportunity of seeing and examining many traps and other appliances at the Medical and Sanitary Exhibition, which would be opened at Kensington in a week or two's time.

A hearty vote of thanks was given to the lecturer, and the Chairman announced that the specimens of plumbing work made by the workmen attending the lectures in competition for the prizes offered in connexion therewith would be exhibited at the Exhibition mentioned if sent in before the 12th of July.

The lecture was to be repeated this (Friday) evening, the 1st. The next lecture of the course will be delivered on the 14th inst.

THE SEWAGE QUESTION.

At the ordinary meeting of the Sanitary Institute of Great Britain, held at 9, Conduit-street, on June 21st, Dr. A. Carpenter in the chair, a paper was read by Prof. W. H. Corfield, M.A., on the Present State of the Sewage Question.

After reviewing various systems, filtration through soil and wide irrigation were treated of at some length. Certainly the sewage had been satisfactorily purified, he said, in many cases, the conditions for satisfactory purification in winter being that the sewage should pass through the soil and not merely over it. Crops of all kinds had been grown by means of it, and in soil that would otherwise bear nothing; and the British Association's Sewage Committee had shown that as great a percentage of the manurial constituents had been utilised as was on an average utilised of the best commercial manure. Although, for various reasons, it had seldom been found to be remunerative, the reader adhered to his opinion formulated ten years ago that sewage irrigation would ultimately be remunerative in many instances, and that opinion was shared by the committee appointed by the Local Government Board in 1876 to inquire into modes of treating town sewage. An irrigation farm should be supplemented by a filter bed to receive and purify sewage when it is not wanted on the farm. The supposed dangers from the proximity of such farms, or from the spread of entozoic disease, were found to be purely imaginary; it was on the whole a better solution of the question for a large number of places than any other, and if, as was very likely, we had a series of dry years, its adoption would receive a great impulse. Where towns cannot make sewage utilisation pay, they must be content to be taxed to a slight extent to get rid of a most serious nuisance, and to secure a low death-rate.

SALES OF BUILDING LAND AT WALTHAMSTOW AND WALHAM-GREEN.

LAST week, Messrs. Protheroe & Morris offered for sale, at the Bakers' Arms, Lea Bridge-road, Walthamstow, eighty-three lots of freehold building land, being part of the Boundary-road estate. Several plots, having frontages of 15 ft. to the Boundary-road, by a depth of 74 ft., realised an average of 60*l.* each; whilst other side lots, of 15 ft. frontage, were sold for 45*l.* each. A tavern plot, having a frontage of 43 ft. to Rosebank-road, by a depth of 116 ft., realised 176*l.* With the exception of nine plots, all the lots offered were sold.

Mr. Charles Belton offered, at the Windsor Castle Hotel, Hammersmith, 105 plots on the Ravensworth House estate, at Walham-road. The property was described as having frontages to the Fulham-road and Cassidy-road, and being within a few minutes' walk of the Metropolitan District Railway station. There was a very large attendance at the sale, with an active and close competition for the several plots offered, the land being manifestly in great demand for building upon. The first lot offered was a corner shop plot, having a frontage of 17 ft. to the Fulham-road, for which there were several bidders, the lot being ultimately sold for 350*l.*, and an adjoining lot having a similar frontage to the Fulham-road realised 305*l.* Another corner plot, with a frontage of 20 ft. to Fulham-road, and a return frontage to Cassidy-road, reserved for a public house, and which it was stated would be the only one allowed on the estate, was sold for 410*l.*; whilst an adjoining lot, having a frontage of 17 ft., realised 285*l.* The remaining lots, having frontages of 16 ft., chiefly to the Cassidy-road, and intended for the erection of private residences, realised an average of 98*l.* per plot. The particulars only announced fifty-four lots for sale, but these having all been sold within an hour, and there being a dis-

position evinced by the company that more lots on the estate should be offered, the auctioneer put up the remaining portion of the estate, comprising forty-nine lots, all of which were quickly sold, the total number of lots disposed of being 105, and the aggregate proceeds of the sale amounting to 12,083*l.*

VALUE OF LAND AND BUILDINGS AT SOUTHEND.

SOUTHEND, as a seaside resort, is now said to be attracting large numbers of visitors, and building on an extensive scale is in progress in the locality. Messrs. Beadel & Co. held an important sale last week of property at Southend, when a piece of freehold land, called Shore Field, facing the sea, containing a little more than nine acres, was sold for 4,100*l.*; two enclosures of freehold land, containing twelve acres, realised 6,700*l.*; the Round House and five acres of freehold land fetched 2,020*l.*; four plots of freehold land, containing eight acres, were sold for 4,650*l.*; Grove Field House, and four plots of land adjoining, containing about three acres, realised 2,000*l.*; and twenty plots of freehold land, containing a little more than twelve acres, were sold for an aggregate sum of 6,180*l.* The total proceeds of the sale were 32,470*l.* The prices realised for the land amounted to an average of 500*l.* an acre.

ST. BOTOLPH'S, ALDERSGATE-STREET.

THE burial-ground of this parish, after having been closed for a number of years, has recently been transformed into a pleasure-garden, greatly to the benefit of the denizens of this busy and populous neighbourhood. The labyrinth of time-worn upright slabs, yclept monuments, the inscriptions on which, having through decay ceased to record the purpose of their presence, have been mostly gathered together and placed against the boundary-walls. The vestry and churchwardens are to be commended for giving an additional lung to the City. With a view to date and mark this improvement, they have erected a handsome sun-dial in the centre, the work of Mr. Forsyth. The pedestal is executed in Portland stone, and is elevated on a platform of the same material, which can be used either as a step or a seat. On the base of the pedestal appears the following inscription: — "This ancient Burial-ground, converted into a garden by the vote of the Parish Vestry, and with the concurrence of the Vicar, was opened to the Parishioners by John Staples, esq., F.S.A., Alderman, on Thursday, October 28th, 1880. S. Flood Jones, M.A., Vicar; George Sims, C.C., John C. Hutchinson, Churchwardens. 1881."

IRISH JUDICIAL DECISION ON BUILDERS' LIABILITIES FOR ACCIDENTS TO WORKMEN.

IN the Belfast Recorder's Court last week, before Mr. Otway, C.C., a cause, "Murray *v.* Pauline," has been decided. The plaintiff, a bricklayer, sought to recover the sum of 40*l.* from William Pauline, of Belfast, builder, for damages sustained by him by falling off a scaffold which defendant had supplied, and which, as alleged, had been erected negligently and insufficiently.

His Worship, in giving his decision, referring to the Employers and Workmen Act, said that statute was chiefly passed with the object of giving a remedy to parties injured by the neglect of their employer,—to remedy what was considered an existing defect in the law. It contemplated, as far as was applicable to that case, the employer using for the purpose of his business certain works and machinery, and provided against injury from any defect in the machinery where such defect arose from the negligence of the employer, but it debarred a remedy when the workman who was injured knew the defect. The case, he thought, must then rest upon the previously existing law, and by that they all knew that the workman who engaged in a dangerous employment took all its ordinary risks, and the master was only bound to provide for the safety of the servant to the best of his judgment. There was no obligation upon the master to take more care of his servant than he would of himself. Here was a man who was a builder. He employed the plaintiff, who was a mason, to build a wall from 7 ft. to 10 ft. high. The workman put up a scaffolding; the employer went to him and doubted whether the scaffolding was sufficient; the workman replied, that "if he fell he would not have far to fall." But the master, thinking to make it more safe, put a piece of timber under the transverse plank. The scaffolding came down, the man fell a distance of 3 ft., and his arm was broken. Upon these facts his Worship held that the common law did not apply either: that it was a mere misadventure, and that the defendant was therefore not liable. He would, therefore, dismiss the case.

Mr. Ward, for the defendant, said he would not press for costs.

THE ART-UNION OF LONDON.

IF the question were asked,—What is the most potent factor in regulating economic operations in England at the present time?—would not the obvious answer be "Co-operation"? The wondrous results of this organisation, as announced at the meeting held a short time since under the presidency of Lord Derby, show the dimensions it has attained. In London who would have dreamed that the few chests of tea purchased by a small number of Post-office clerks, and divided amongst themselves at cost price, would be the germ of that system which is now represented by numerous associations, occupying buildings of large size and costly arrangement, and turning over hundreds of thousands of pounds annually?

A remarkable instance of this co-operative power is given in a work now being issued by the Art-Union of London. We allude to the set of etchings, very successfully produced by Mr. Flameng, from Mr. Frith's remarkable series of five pictures,—"The Road to Ruin." Every subscriber of one guinea to the Art-Union will receive this set of first-class prints, in addition to a share in the distribution of prizes, a work which no publisher could afford, single-handed, to produce for many times the amount; it happens, in fact, that, at this moment, a series of five plates, of a cognate subject, from paintings by the same artist, is offered to the public at the price of ten guineas, though the process employed to produce the engraving is really less artistic than the style of pure etching adopted by the Art-Union.

We must here notice how Science steps in to the aid of her art-sister. It would be impossible to produce within any reasonable time, by printing from the original five plates, the number of impressions which, judging from the demand for the chief works of the Art-Union, will, in all probability, be required to supply the subscribers in all parts of the world, but by the aid of that marvellous power which "puts a girdle round about the earth" in less time than Puck undertook to do it in, a reproduction of the plate is so accurately made that not the slightest difference can be perceived by the strongest magnifier between that and the original. The deposit of the infinitely minute atoms of the metal in the matrix is so subtle and so true, that the faintest indication in the original is accurately repeated in the other. By means of this multiplication of plates, any number of impressions, all of equal value, can be produced; and thus, within a comparatively short time, all the subscribers can be supplied.

Our readers will doubtless remember the pictures, which were always surrounded by a crowd in the Royal Academy Exhibition of 1878. Our modern Hogarth selects for his theme a phase of life of the nineteenth century with which all are, more or less, familiar. The story opens with a college card-party, just breaking up, at early dawn. The host, by his surroundings, is evidently gently nurtured and with abundant means. The painter then takes the hero to Ascot, where he stands, betting-book in hand, on the lawn, in the midst of fair women and the *élite* of the upper ten thousand. The not unfrequent result of a life so commenced ensues, and we have a visit from the bailiff's followers, foreshadowing the sacrifice of the costly furniture and all the appliances for a luxurious life by which we see the hero surrounded. Then follow exile, and the family with its scanty belongings seeking shelter in some small town in France or Belgium. The man and wife are endeavouring by pen and pencil to earn something to keep the wolf from the door, when the landlady enters with a long bill. In the last scene we are back again in England, and in a miserable attic; the early dawn looks in on a scene, how different from that gay party at Cambridge! The hero hurriedly looks the door, while on the table is a pistol, with caps and balls, terribly presaging what may be the object of their purchase.

We have here a series of scenes which pre-eminently tell their own story, and this is always a great element of success, since the majority of people like to be saved the trouble of thinking much before they arrive at the meaning of a picture. In this, as in everything else in the present day, we are all too much in a hurry to spare time for any one particular subject. The paintings themselves can be seen for a few days at the rooms of the association in the Strand.

RESTRICTIONS IN FEU CONTRACTS.

HISLOP *v.* LECKIE.

THIS was an appeal to the House of Lords from a judgment of the Court of Session in Scotland. The case was argued a short time ago, before the Lord Chancellor, Lord Blackburn, and Lord Watson, when judgment was postponed.

Their lordships, in giving judgment on the 23rd ult. said that the effect of the interlocutors appealed against was to enforce against the appellant, a carriage-builder in Edinburgh, at the suit of the respondents, who were adjoining occupiers, certain restrictions on building contained in a feu contract. Those interlocutors were right if the respondents, who were neighbouring feuars under the same superior, were, by the combined effect of their own and the appellant's titles, interested in the obligations and restraints imposed upon the appellant by his feu contract, so as to be able to enforce these obligations and restraints for their own interest, if the superior was or ought to be deemed a party complainant in the action in such a sense as to be suing for his own separate interest. Their lordships were of opinion, however, that the fact of several feuars of the neighbouring plots of building-land in the same street holding from a common superior did not of itself entitle one of those feuars to claim the benefit of restrictions contained in the feu contract of another, unless some mutuality and community of rights and obligations were otherwise established between them, which could only be done by express stipulation in their respective contracts with their superior, or by reasonable implication from some reference in both contracts to a common plan or scheme of building, or by mutual agreement between the feuars themselves. Here there were none of those things, and as the mere consent of the superior to the action being brought did not place him in the position of having brought the action in his own interest, the finding of the Court of Session in favour of the respondents must be reversed.

Judgment reversed with costs.

A WATER COMPANY FINED FOR INADEQUATE SUPPLY.

AT the Thames Police-court, last week, the secretary of the East London Waterworks Company was summoned before Mr. Lushington, by the owners of Sampson's House, Albion-street, Mile-end, for neglecting and refusing to furnish an adequate supply of water, for which the rates had been duly tendered and paid. Mr. Young, solicitor, conducted the prosecution. There were no fewer than twenty-eight summonses against the company for not providing a proper supply of water.

It was stated that there were two cisterns on the premises, 23 ft. from the ground, but the adjoining houses were supplied from butts only 4 ft. from the ground. Each cistern when full held about sixty gallons of water, but from the 15th of May until the 19th of June the supply was insufficient for the wants of the persons living in the house, and they had to borrow water from neighbours. The supply-pipes in the cisterns were in proper order, but the water was only laid on for twenty minutes, and did not flow freely.

Mr. Lushington, the magistrate, said he had no doubt that there was not a sufficient pressure of water. He imposed the full penalty of 10*l.* for that offence. The rates had been paid for the last two years, and the complainants were entitled during the whole of that time to a proper supply of water. He fined the defendants 20*s.* and 2*s.* costs on each of the twenty-seven summonses, and 5*l.* 5*s.* costs; making a total of 44*l.* 19*s.* to be paid to the persons who paid or tendered the rate.

Silk Cultivation.—Professor Luigi Sartori, of Treviso, after long study and outlay, has, he says, discovered a perfect system of cultivating silk-worms, a system by which Italy will be enabled to save 500,000,000 francs per annum. Since 1872, the *Japan Weekly Mail* says, Sartori has been delivering lectures on his new method in the various Italian towns, and, if rumour may be credited, his motives are purely patriotic. At a meeting lately held in Rome, Sig. Miraglia, president of the Agricultural Society, and many other competent persons, were present, all of whom declared themselves quite satisfied as to the importance and great advantages to be derived from Sartori's system. As a result of this meeting he received a Government prize of 500 francs, and had the honour of an audience with his Majesty the King, to whom he explained his scheme in detail. The King said that steps ought to be taken for overcoming the apathy of the Italian producers in this matter, by making them acquainted with the advantages of the new system. In order to show what interest he himself took in the industry, he ordered the construction, at his own expense, of a movable house for reproducing silk-worms, after the design of Sig. Sartori, to be exhibited at Milan.

PATENT RECORD.*

APPLICATIONS FOR LETTERS PATENT.

2,530. G. F. Wynne, Wrexham. Drilling, boring, or cutting rock, &c. June 10, 1881.

2,536. L. W. Beck, Duffel, Belgium. Drying ceramic products and bricks. June 10, 1881.

2,539. M. Delmard, Plumstead. Chimney cowl and ventilator. June 10, 1881.

2,555. A. Harvey, Glasgow. Water taps or valves. June 13, 1881.

2,559. G. F. Wynne. Wrexham. Drilling, boring, or cutting rock, &c. June 13, 1881.

2,561. C. H. Pennycook, Glasgow. Bars for securing glass for windows, &c. June 13, 1881.

2,576. W. J. Hopkins, Worcester. Expanding and contracting fire-grates. June 14, 1881.

2,590. W. R. Lake, Southampton Buildings. Grate-bars, &c. (Com. by W. N. Fairbairn, Boston, U.S.A.) June 14, 1881.

2,616. G. Hodson, Loughborough. Manufacture of chimney-pieces, &c. June 16, 1881.

2,624. W. T. Sugg, Westminster. Gas cooking-stoves. June 16, 1881.

2,628. W. W. Beaumont, Camberwell, and J. Welman, Poole. Apparatus for dressing and cutting stone, &c. June 16, 1881.

2,629. G. A. Wright, Portsmouth. Materials for forming blocks for use in buildings, &c. June 16, 1881.

2,633. S. Hodgkinson, Manchester. Window-blinds. June 16, 1881.

2,636. G. J. Cox, Maidstone. Gas cooking and heating stoves. June 16, 1881.

ABRIDGMENTS OF SPECIFICATIONS

Published during the Week ending June 18, 1881.

1,448. E. R. Hollands, Stoke Newington. Fire-grates.

The fire-basket has a movable bottom, and when the fire is to be fed, a set of bars enter from the back horizontally, and lift the fuel off the movable bottom, which then falls down and the fresh fuel is put thereon below the fire. The movable bottom is then raised and the horizontal bars drawn back. Oct. 30, 1880. Price 8d.

1,504. A. Jennings, Glasgow. Fire-places, &c.

The bottom and the back of the fireplace are made of brick, curving outwards at the upper edge, and the products of combustion flow backwards into a short flue pipe, which has a curved plate placed over its upper end to prevent any down-draught. A metal casing is formed above the fire-place, communicating by pipes with the outside air and the apartment, whereby the air of the apartment is thoroughly warmed. Nov. 4, 1880. Price 6d.

4,540. R. H. Reeves, Parkhurst. Apparatus for detecting the escape of noxious gases from drains.

A U-shaped tube is connected to the drain, which is partially filled with a chemical re-agent in solution. Potassic permanganate is diluted with acetic acid is preferred. A test paper prepared to be sensitive to the re-agent is inserted in the end of the tube, and a graduated scale is provided. The pressure, as well as the quality of the gas in the drain is thus determined. Nov. 5, 1880. Price 6d.

4,542. L. W. Leeds, Woburn-place. Steam heating apparatus.

The firebox is lined with fire-clay, and a large fire-brick is hung above the fire, leaving only a small annular passage for the escape of the products of combustion. This ensures thorough combustion of fuel. The generation of the steam is regulated by an air-pipe leading to beneath the grate-bars with another branch leading to the space above the suspended fire-brick, &c. The port of this pipe is controlled by a slide connected to a weighted lever, operated by a piston, whose motion is governed by the pressure of steam in the boiler. This pressure, as it increases, closes the air-port and checks the draught. Nov. 5, 1880. Price 6d.

4,544. H. H. Lake, Southampton-buildings. Furnaces or fireplaces for the combustion of fuel without smoke.

The fuel is fed through an opening arranged above the grate, and above the ordinary door, which has an inclined feed throat, upon which the fuel forms, in front, a heap having sufficient slope to allow it to fall upon the back part of the grate, where the combustion takes place. (Com. by La Société Nessi Frères, Paris.) Nov. 5, 1880. Price 6d.

4,585. W. S. Melville, Mile-end. Apparatus for supplying fuel to fireplaces.

A shovel has a chamber formed in the after part, which has a hinged flap as a cover. The handle of the shovel is hollow, and receives the stem of a piston. The chamber is charged with fuel, and the flap closed. The shovel is then slidden into the lower part of the fire, the flap is lifted, and the piston ejects the fuel into the fire. The smoke is in this way consumed. Nov. 9, 1880. Price 6d.

4,640. H. J. Haddan, Strand. Apparatus for regulating and measuring the flow of liquids.

A vertical cylinder encloses a piston. A horizontal cylinder is connected to this below the piston, at the other end of which is an inlet chamber, provided with a disc valve. As the water enters by two orifices, it removes the valve a little from its seat, and so passes through the cylinder and up between the circumference of the piston and the inner surface of the vertical cylinder. If more water enters than can flow through this annular passage, the piston is lifted, and thereby actuates a lever in the horizontal cylinder, which causes the disc valve to partly close the passage. (Com. by E. de P. Isaura y Fargas, F. Garcia y Corvers, and J. Barrufet y Veciana, Barcelona.) Nov. 11, 1880. Price 4d.

4,660. H. E. Cooper, Great Dover-street. Syphonic apparatus for closet flushings, &c.

A syphon pipe is attached by a flexible tube to the outlet pipe, and is held suspended by a lever with the bend a little above the level of the water. When it is pulled suddenly down, it establishes a syphonic action. (*Pro. Pro.*) Nov. 12, 1880. Price 2d.

* Compiled by Hart & Co., patent agents, 28, New Bridge-street, E.C.

CITY CHURCH AND CHURCHYARD PROTECTION SOCIETY.

THE second annual meeting of this society was held on the 23rd ult. in the Egyptian Hall of the Mansion House, under the presidency of the Lord Mayor.

Mr. Wright, hon. sec., read the report, from which the following is a quotation :—

"The Council, in presenting their second annual report, are deeply thankful to be able to announce that the yearly destruction of a City church, which had been the average for the past ten years, has, since the formation of the society, happily ceased. They cannot, however, believe that all attacks have ended, but have been postponed in order that the public mind may be prepared for some more drastic scheme on the publication of the census returns of those who slept in the City on the first Sunday in April. But, fortunately, there will be equally reliable statistics from the day census taken by the Corporation as to the vast numbers of those who spend the greater portion of their lives within the confines of the City parishes. The attention of the council has been drawn to a return published in the *St. James's Gazette* for June 13th, 1881, professing to give returns of the congregations of the City churches, which they believe to be misleading. That census is based on the attendance at the morning service, but those in the habit of worshipping in the City churches know that the evening services are frequented by much larger numbers."

Mr. H. C. Richards, in moving the adoption of the report, gave it as his view that there were signs of a disposition, on the part of merchants and others, to reside in the City.

Mr. C. Kegan Paul seconded the motion. He did not propose to enter at any length into the arguments for the retention of their churches and churchyards, as he had already done so in a recent number of the *Nineteenth Century*. Supposing the churches were empty on the Sunday, and even supposing they were not utilised during the week, yet they should not be pulled down. He believed the time would come when the resident population of the City would be much greater than it was now. But apart from this there was the historical and architectural value of the churches.

The report was unanimously adopted.

The Rev. Canon Venables (of Lincoln) moved, "That this meeting expresses its satisfaction at the success which has hitherto attended the efforts of the Society." Although he was an ardent lover of Gothic, he was eclectic in his admiration, and he was a great enthusiast for Sir Christopher Wren's churches. When he looked back he could remember the grand old buildings,—St. Michael's, Queenhithe, and St. Benet's, Gracechurch-street. He could never forget the graceful spire of St. Antholin's, and he could not understand why it was swept away. He believed if City clergymen would give good services and live in their parishes they would get people to attend church.

The Rev. Canon Shuttleworth seconded the motion, which was adopted, as was one pledging the meeting to support the Society in further action to prevent the demolition of any more of the City churches.

ARCHITECTS AND QUANTITIES.

SIR,—"H. H. B.'s" letter in your issue of June 18th would surely have been better unwritten. An impartial observer would come to the conclusion that the merits of "H. H. B." and the surveyor's clerk had been compared, and that the comparison had been unfavourable to the architect. It is nonsense to argue that a man makes a change like that as a pure matter of caprice. The result was, no doubt, galling, but it surely is not sufficient justification for the mud "H. H. B." throws at surveyors generally towards the end of his letter. Would the contents of the "snugly-packed nutshell" have been less if "H. H. B." had carried out the work and taken off the quantities in his own office? or, for the matter of that, in any case where the architect attempts it? C. P.

The Rowland Hill Statue, Kidderminster.—The statue recently unveiled at Kidderminster is placed upon a pedestal of Cornish granite from the Carnsew Quarries of Messrs. John Freeman & Sons, Penryn.

"KING INA'S PALACE."

SIR,—You may, perhaps, remember that some twenty or thirty years ago there was a talk of my buying the Mediæval house called King Ina's Palace for the purpose of preserving it, but from circumstances into which it is now useless to enter I did not do so, and it fell into the hands of some one who knew nothing or cared nothing about architectural history, but who had some money, and he employed the builder of a neighbouring town, who dubbed himself an architect, to "restore" it, as he called it,—in other words, to destroy all that gave it any value. The peculiarity of it was that the original woodwork and all the internal arrangements were entirely preserved, of which I know no other instance. My lamented friend Burges, whom I have lately lost, told me that some friend of his, another young architect I think, had a complete set of drawings of it, if I liked to buy them and have them engraved. It was not convenient for me to do this at the moment, and I let the opportunity slip, which I now regret. Perhaps you can tell me who this was, and whether the drawings are still to be had? If you do not happen to know, perhaps you can make inquiry for me, and let me know the result.

Some twenty years ago, after my long and serious illness at Windsor, I was sent to Rome by my doctors, and I spent fifteen winters there, becoming so much interested in the archæology of Rome that I somewhat neglected that of England for a time. I am now forbidden to go there again, and am told that I must remain quiet in England for the remainder of my days.

JOHN HENRY PARKER, C.B.

*** We do not know if the drawings are still to be had, but we hope one of our readers will give the required information. We have good reason to remember "King Ina's Palace," for the insertion of a letter at the period above referred to, from an eminent archæologist, commenting on the restoration, and our refusal to give up the name of the writer, brought upon us, as Mr. Parker will recollect, an action for libel, and cost us much trouble and more than 300*l.* The second and only other action for libel that we have had to defend was brought on us by the insertion of a short letter exposing the condition of a back-yard near Charing Cross, the correctness of which was proved by several witnesses, and for which we were mulcted in the sum of 250*l.* It is thus that enlightened British juries have expressed their admiration of long-continued efforts on the part of the *Builder* to protect our ancient monuments and improve the health of towns! However, we are not complaining; we are simply telling a story which is not uninstructive.

ASHBURNHAM HOUSE.

SIR,—I see that in your last week's print there is a short letter signed "G. J.," wherein the question is very rightly raised, at this time, as to who was the architect of this noteworthy building.

I think it would be well for students if you encouraged the bringing out as many facts as possible on the subject; and if you brought forward the opinions of sound judges of style, some satisfactory decision might be come to. My own opinion (sound or unsound) is, first, that the house was designed by a skilled architect of the time, and not by a mere follower of the fashion of the day; secondly, that the style is more free from the vice of stateliness, with its attendant dulness, which so cursed the Renaissance art of Europe, than is seen in Wren's or the architecture following his. Wren was so great a man that he avoided the worst faults of the style; but I have seen no work of his where so much richness and invention are allied to such simplicity and directness as is plain on the face of the original parts of Ashburnham House. On close examination of the detail it will be seen that, here and there, and that frequently, there is some touch of the naturalness and invention of an earlier style. Notice the conventional roses in the pierced scroll-work; the pattern in the soffit of the corona of one of the cornices; and the leafage in the carving of the projecting beads of the panel frames. Also, notice the rather rude but vigorous and artistic way in which the great egg-and-tongue moulding is carved on the staircase. These things alone would not have biassed my mind very strongly; but finding them in combination with admirable proportion, with such aptitude in adapting the so-called Classic

forms; and, lastly, but the most telling point of all, seeing what an appearance of space and dignity is gained, and yet with a homeliness of effect, I cannot but think that the architect of Laud's Quadrangle, at St. John's College, Oxford, built Ashburnham House, Westminster.

PHILIP WEBB.

SYNTACTIC ARCHITECTURE.

SIR,—The Maudles and Postlethwaites of architecture who continue to "exist beautifully," and, in spite of their apparent unmanliness, manage, by some means, to increase and multiply, must admit that there must be some proportion between width and height both in a whole building and in a section, or bay. It is time that something were done to draw up a set of rules as a guide to assist in designing, but not to obstruct.

The Vitruvian rules, I admit, are by far too rigorous, and their enforcement was one of the causes that led to a reaction in the opposite direction.

Many customs, manners, and costumes have had their origin in architecture. The æsthetic school of the present day clearly owes its origin to the pleasing school of architecture. Architecture, therefore, has a great responsibility, even though it be partly accidental.

It will, I think, be a moral disgrace to our profession if we do not use the means that we find are in our power of putting an end to what is literally nauseous.

W. S.

MILDEW.

SIR,—I would advise "A Reader" to try tinfoil. I have used it in several trying situations myself, and it has always succeeded. It may be applied to the wall by means of a paste made of thick white-lead paint, taking care to let all get well dried before papering over it. Although the first cost may be rather more than some of the other and more usual, though practically worthless, preparations, it will be very much cheaper in the end. The cost of the tinfoil will be about 7s. 6d. per roll of thirty-six sheets, each sheet measuring 18 in. by 16 in.

H. G.

FORFEITURE OF BUILDERS' GOODS TO FREEHOLDERS.

THE following memorandum has been addressed to the Committee of the House of Commons now considering the Bill of Sale question, and deserves consideration:—

Will you pardon my drawing your attention to a matter which would, I venture to suggest, be worthy of investigation by you, as it seriously affects merchants trading with builders?

It is now perpetually the case in the failure of a builder for the creditors to find that the bricks, timber, lime, iron, lead, and other goods supplied to the builder are, although not fixed to the building, but simply lying loose on the ground, claimed by the landowner, under a clause in the building agreement, which forfeits to the landowner all loose material in the event of the builder filing a liquidation petition.

Surely, as against the creditors of the builder, this is a most vexatious clause, and should be altogether prohibited by law, or, at least, deeds containing such clauses should be registered as bills of sale.

It is a very easy and common thing for an owner of land to "get a man of straw" to build for him under the foregoing conditions, coupled with promises of never-failing funds, on the strength whereof the builder gets large quantities of goods on the job, and when his liabilities fall due, the landowner not finding sufficient money to enable the builder to pay for such goods, the builder is compelled to file his petition, and the landowner, under the forfeiture clause in the building agreement, takes possession of the land, buildings erected thereon, with the creditors' goods, and more particularly of the loose goods on the ground; and when the builder meets his creditors he simply informs them of this, and expresses regret, alleging the landowner has deceived him.

The creditors cannot help themselves, and feel bound to accept almost any offer that is made, such offer very often being secured by the landowner.

ROBERT GIFFORD, A. C. A.

The Proposed New Railway Station at Blackfriars.—Last week a Select Committee of the House of Lords passed the Bill authorising the London, Chatham, and Dover Railway Company to construct a double line of rails, commencing at the south end of Blackfriars passenger station and terminating at the south side of Upper Thames-street. The Bill gives powers to the company to carry the lines across the Thames either by widening their existing bridge at Blackfriars or constructing a separate bridge with four sets of piers in the river similar to the present one. These works are about to be carried out in order to relieve the city and suburban lines of this company.

CHURCH-BUILDING NEWS.

Four Elms, Kent.—The new Church of St. Paul, Four Elms, near Edenbridge, has been consecrated by the Archbishop of Canterbury. The building, which is Early Thirteenth Century in style, consists of nave, transepts, and chancel. On the north side of the latter are the vestry and organ-chamber, and at the west end of the church is a semicircular recessed baptistery. The walls are of Portland cement concrete, faced externally with Limpsfield stone, and internally with Bath stone, relieved by bands of Tonbridge sandstone. The dressings are of Box-ground stone. The open-timbered roof, which is of pitch-pine (all the rafters and timber left in their natural state, and the boarding between stained dark walnut), is covered with tiles, and surmounted by an oak *flèche*, containing the bell. The seats and fittings throughout are also stained walnut, and varnished. The east end is square, and contains a window of five lancet lights, the inner order of the arch-mouldings being carried on detached shafts of blue Pennant, with moulded bands and carved caps. This window is filled with a representation on the principal fields of the "Ascension," under which are five groups,—the "Agony," "Bearing the Cross," the "Crucifixion," the "Resurrection," and "Noli me tangere." The subjects occupy the entire area, without canopies. The windows on either side of the sanctuary contain our Lord as the "Bread of Life" and the "True Vine," and two other windows in the chancel the "Good Shepherd" and the "Light of the World." All these have fields of foliated ornament. The south transept, or St. Paul window, of three lights, contains the "Stoning of Stephen," "Conversion of St. Paul," and "Preaching at Athens." These all have canopies. The baptistery contains seven lights,—two, the "Passage of the Red Sea"; two, "Noah Entering the Ark"; and the centre three, "Christ Blessing Little Children." All the glass has been executed by Messrs. Clayton & Bell. The floor of the chancel is in rich tiles and mosaic, by Messrs. W. B. Simpson & Sons. The font, which is of Caen stone, was executed by Mr. Bradford, of Kennington. The pulpit, which is in character with the font, was executed by the builders. The rails, &c., to pulpit steps are of hammered and polished brass, and, together with the pendent and standard lamps, brackets, &c., were executed by Messrs. Faraday & Sons, of Berners-street, W. The organ is by Messrs. Gray & Davison. The heating apparatus is by Messrs. Bacon & Co. The brass lectern and the altar-cloth are by Messrs. Frank Smith & Co. The builders were Messrs. Punnett & Sons, of Tonbridge; and the whole of the work has been carried out from the designs and under the superintendence of Mr. Edwin T. Hall, of London.

Monmouth.—The restoration of St. Mary's Church, Monmouth, has been commenced. The architect is Mr. G. E. Street, R.A., and Messrs. Wall & Hook are the contractors.

Heaton Norris.—A meeting of parishioners has been held to consider alternative plans prepared by Messrs. Preston & Vaughan, architects, of Manchester, for the enlargement of the church. In either scheme it was proposed to form a quasi-chancel or *chorus cantorum* by enclosing the most easterly bay of the nave with screens of light open wood-work on the north, south, and west sides; and by raising the floor two steps above the level of the present nave floor. New reading-desks and choristers' seats would be placed in this quasi-chancel, and the floor between the seats would be laid with encaustic tiles. The present west entrance would be entirely re-arranged in order to render it more convenient for worshippers entering or leaving the church, and the font would be removed to the west end of the north aisle. In the first or lesser scheme the present vestry would be retained, and a porch with a staircase leading to a new choristers' vestry above would be erected on the north side of it. The organ would be removed from its present position in the west gallery, and placed in the north-east corner of the north gallery. In the second scheme it was proposed to extend the present sacrarium about 9 ft. eastwards, in order to form a chancel of due proportions to the size of the church, and to build new priests' and choristers' vestries on the north side of it, with porch and staircase leading to a spacious organ-chamber above. The organ chamber would be open to the church on the south and west sides, and there would be traceried screens in the archways. Under the east window, which would be remodelled, there would be a new reredos. After some discussion it was resolved unanimously to adopt the second scheme, and to apply for a faculty for its execution.

Ryde, I.W.—Mr. Barton, the contractor for the completion of the parish church, has commenced the work. The architect of the church was the late Sir Gilbert Scott, R.A., and his son, Mr. John Oldrid Scott, has prepared the plans for the completion of the tower and spire, &c. The tower is to be built of the best Swanage stone, in irregular courses, 80 ft. from the ground, and finishing with a battlemented parapet, with carved pinnacles at each corner. The spire will be octagonal in shape, and will be decorated at the base with four crocketed double-pinnacled lights. The spire will be built with the best Box-ground Bath stone, terminating with a cap of solid Portland stone.

Poole.—The corner-stone of a new organ-chamber and vestries for Parkstone Church has been laid by Lady Brown, of Hillside, Parkstone. These additions, the site of which is on the north side of the chancel, are of Gothic design, harmonising with the present structure, and the dimensions are,—vestries, 44 ft. by 16 ft., and the organ-chamber 12 ft. by 14 ft., with a height of about 30 ft. Mr. Pearson, R.A., is the architect; Mr. S. Clarke, of Parkstone, the builder; and Mr. H. F. J. Barnes, of Poole, the clerk of the works.

Ludlow.—The new Church of St. John the Evangelist has been consecrated. The foundation-stone was laid on the 10th of June last year. The church is situated on a commanding site on Gravel Hill, and it is built in the Early English style. It consists of a nave, chancel, south aisle, vestry, and porch, the dimensions of which are as follow:—Nave, 74 ft. long by 24 ft. 4 in. wide; chancel, 30 ft. by 22 ft. 3 in.; south aisle, 77 ft. 10 in. by 10 ft. 9 in.; vestry, 15 ft. 6 in. by 11 ft. 6 in.; porch, 7 ft. 6 in. by 7 ft. From the floor, the height of the nave walls is 23 ft.; the chancel, 21 ft.; and the south aisle and vestry, 11 ft. The height to the apex of the nave roof is 43 ft., and 38 ft. to the apex of the chancel. A lean-to roof is placed over the south aisle. The timber used in the construction of the roof is of wrought and moulded pitch pine. The chancel roof is boarded on the underside with pitch-pine, and divided into panels, with moulded ribs and cornice. The walls of the church are built of native Pennant stone, with rock face, and squared beds and joints. The external dressings to the windows, doors, buttresses, bell-turret, and gate piers and copings are all of Box weather stone; and the internal dressings of the arcades and chancel arch are of Corsham Down stone. Provision has been made for a future north aisle; the arcade has been built, and the arches erected, with a two-light tracery window inserted in each arch. The bell-turret stands on the west gable of the nave, and rises about 20 ft. above the nave roof. The cost of the church is 4,000*l.* The architect is Mr. A. W. Blomfield, M.A., of London; and the contractors were Messrs. Wall & Hook, Brimscombe, Stroud.

Birmingham.—The foundation-stone of a new chancel to All Saints' Church has been laid. In connexion with the chancel two vestries will be built. Other works to be done include the removal of the side galleries, the re-seating of the church, and the provision of improved arrangements for lighting and heating the building. It is estimated that an expenditure of about 1,400*l.* will be required to effect the various improvements, which are being carried out by Mr. W. Robinson, builder, from the designs of Mr. J. A. Chatwin, architect.

SCHOOL-BOARD SCHOOLS.

London.—At a meeting of the School Board for London, on the 2nd ult., on the motion of Mr. Stiff, a recommendation of the Works Committee was adopted, to the effect that an expenditure of 290*l.* should be sanctioned for the erection of a cookery class-room on the Marlborough-road site (Chelsea). Mr. Stiff then moved the adoption of a report of the Works Committee, containing the following recommendations:—The committee have invited tenders for the erection of a school to provide accommodation for 1,100 children on the site in Lyndhurst-grove, Peckham. The committee recommend that so soon as the plans shall have been approved by the Education Department, the lowest tender, that of Mr. Tongue, of Plumstead,

amounting to 9,922*l.*, be accepted. Cost per head, school buildings only, 6*l.* 18s. 4d. Total cost per head, 9*l.* 1s. 8d. The committee have invited tenders for the enlargement of the school in Thornhill-road, Islington, by 200 places. The committee recommend that, so soon as the plans shall have been approved by the Education Department, the lowest tender, that of Messrs. Wall Brothers, of Dale-road, Kentish-town, amounting to 1,699*l.*, be accepted. Cost per head of school buildings only, 6*l.* 19s. 1d. Total cost per head, 8*l.* 9s. 10d. The school in Orange-street, Borough, was erected by the Board in 1873-4, and, in order to keep down the cost per head, no rooms were provided for teachers, and only an insufficient amount of cloak accommodation for the children. The committee think that these deficiencies should now be supplied, and they have accordingly obtained tenders for erecting three teachers' rooms, and also for providing proper cloak accommodation for the three departments of the school. The committee recommend that, so soon as the plans shall have been approved by the Education Department, the lowest tender, that of Messrs. T. E. Julian & Co., of Marshall-street, St. George's-road, S.E., amounting to 675*l.*, be accepted.

Stockton.—New Board-schools in Bowesfield-lane, Stockton, have been opened. The style adopted is described as "Early English, adapted according to the requirements of plain brick-work, in which all the coupled windows, arches, and mullions are executed." The central portion is occupied by the infants' school, the roof of which is higher than any of the others, being surmounted with a ventilating turret, with a steep-pitched lead roof and vane at the summit. This central block is flanked on the north and south by the girls' and boys' departments respectively, with ornamental terminals at the apices of roof. The main front and sides consist of a repetition of coupled lancet windows and piers, supporting arches and labels with ornamental scrolls of foliage, also fillings-in of bold terra-cotta bosses. This front is relieved by four projecting gables, which have each a lofty three-light window, comprised within a large arch, filled in with pointed diagonal brick-work. The top portion of these gables has a perforated stone ventilating band and red diaper work in relief, with a moulded stone finial and stone coping. Internally the schools are lofty, and lined with a dado 4 ft. high of glazed bricks, with coloured bands along top and base. The schools were built by contract, the price being 3,083*l.*; and the total number of children for whom accommodation is provided is 723. Messrs. Wetherell & Moses were the architects; Mr. Lazenby was the builder; and Mr. John Bage the clerk of works.

Warley (near Sowerby Bridge).—The corner-stone of a new girls' school for the Warley School Board was laid on Whit Monday. The building, when completed, will be a substantial structure, provided with all modern appliances. Mr. Utley is the architect.

Aston.—New Board-schools in the Albert-road, Aston, have been opened. The schools consist on the ground-floor of the boys' school-room, 80 ft. 8 in. long by 22 ft. wide, with three class-rooms, each 24 ft. 8 in. by 22 ft.; the infants' school-room, 64 ft. by 30 ft.; the babes' room, 30 ft. by 24 ft.; and two class-rooms, each 30 ft. by 23 ft. The girls' school-room is placed on the first floor, and is 62 ft. 9 in. by 22 ft. 9 in. with two class-rooms, each 24ft. 8 in. by 22 ft., and a third 25 ft. 5 in. by 22 ft. Separate entrances, with lavatories and cloak-rooms, are provided to each school; separate rooms are also provided for the use of the master and mistress in each school. The whole afforded accommodation for 320 boys, 280 girls, and 502 infants, making a total of 1,102. The playgrounds have been paved with tar paving, and have covered sheds for the protection of the children in wet weather, and the whole site is enclosed with a fence railing. The materials employed are of the simplest kind, the principal portion of the facings being of common red bricks. The heating apparatus for the school and class-rooms has been supplied by Messrs. Haden & Sons, and the works have been carried out by Messrs. Wilson & Son, under the direction of the architect, Mr. E. Holmes. The cost of the site, which consists of 5,000 yards, was 2,550*l.*; of the buildings, including a caretaker's house and architect's commission, 8,244*l.*; and of the furniture, 517*l.*; making the total expenditure 11,311*l.* The cost per head, exclusive of the site, is 7*l.* 19s.; and, including the site, 10*l.* 5s. 3½d.

STAINED GLASS.

Prestbury.—A memorial-window, the work of Messrs. Barlison & Grylls, of Newman-street, London, has been placed in the old parish church of Prestbury. It occupies a position over the doorway in the west gable of the recently-restored north aisle, and is of three lights, with a pointed head filled in with tracery of Perpendicular character. The central light contains a figure of the Saviour crowned with thorns and bearing His cross, the two Marys are represented as following, and in the rear is seen the door of the Prætorium. In the side light, on the left, the subject is Martha and Mary at the feet of Jesus, and the corresponding light on the right has a representation of the two Marys at the sepulchre. Each group of figures is surmounted by a canopy enriched with tabernacle work, and in the spandrels of the principal lights is an inscription.

Ramsgate.—Two stained-glass windows have been placed in the clearstory at St. George's Church, to the memory of the late Miss Sarah Rammell, by Mr. George Rammell and other members of her family. They represent St. George, the patron saint of the Church of England, and St. Alban, the first British martyr. They were executed by Messrs. Clayton & Bell, of London.

Pennfields. — A three-light stained-glass window has just been placed in the north transept of St. Philip's Church, Pennfields, near Wolverhampton, in memory of the Rev. Prebendary Dalton, who was vicar of that church for many years. The window is from the works of Mr. Samuel Evans, West Smethwick, Birmingham, and the subject treated is "Christ blessing little Children."

Miscellanea.

The Proposed Removal of the Mint.—At a sitting of the Select Committee to whom the City Lands (Thames Embankment) Bill was referred by the House of Commons, Mr. Shaw-Lefevre in the chair, Mr. Wollaston Blake, of the firm of James Watt & Co., Birmingham, —a director of the Bank of England,—gave evidence in support of maintaining the Mint in its present site. He saw no necessity for the removal to the site on the Thames Embankment, which would entail an expense of 480,000*l.*, of which 235,000*l.* would have to be paid to the Corporation of London for the land, 45,000*l.* for machinery, 50,000*l.* for interest of money for four years before the old site could be disposed of and the new building erected, 15,000*l.* for professional expenses, and 15,000*l.* for contingencies. Deducting 180,000*l.* for the old site would leave a net cost of 300,000*l.*, for which he saw no occasion. Mr. Bramwell, C.E., on the contrary, stated that none of the plans submitted to him were such as he could adopt, his dominant instruction from Government being that there must be no stoppage of the Mint. He thought no satisfactory alterations could be made at the present Mint without rebuilding it, which would take eighteen months or two years.

Society for Improving the Condition of the Labouring Classes.—The thirty-seventh annual meeting of this society was held last week at Willis's Rooms, the chair being occupied by the Earl of Shaftesbury, the president. The secretary read the annual report of the committee, from which it appeared that the houses of the society are in good repair. The society's annual summary of the deaths and their causes placed the rate of mortality throughout the houses at 20 per thousand. From the cash account, it appeared that the receipts from all sources during the year amounted to 5,788*l.* 5s. 2½d., which, with a balance in hand at the beginning of the year, made a total of 6,417*l.* 5s. 7½d. The total expenditure amounted to 5,947*l.*, leaving a cash balance of 470*l.*

Sculptures, St. Mark's, Venice.—Mr. G. Grove writes to urge that it would be a benefit to those who attempt to study St. Mark's, Venice, if a book were published containing a list of all the sculptures and mosaics of the church, with their inscriptions. "The list should begin from some definite point, and follow a regular order; should give the subject of the piece and the inscription thereon, with its decipherment, if necessary; and the known or probable date."

Lydd and Dungeness Railway.—The Government inspection of a new line of railway, which may probably develop at no distant date into a new route to the Continent, has just been completed. The new line accommodates a district which has hitherto lacked railway facilities. It branches off at the Appledore Station of the Rye and Hastings branch of the South-Eastern Railway,—85 miles from London,—and passes through or by the villages of Snargate, Brenzett, Old Romney, Mydley Chapel, and the ancient town of Lydd,—where there is a station,—to a point about one hundred yards north-east of Dungeness Lighthouse. The promontory of Dungeness is the nearest point on the English coast to the Continent, Cape Grisnez being distant not more than twenty miles. The length of the new line—which is designated as the Lydd and Dungeness Railway—is ten miles. The depth of water at Dungeness, even at low tide, is never less than 15 ft., so that vessels of the draught of the Holyhead packets can ride safely at almost a stone's throw from the beach. Whenever the Dungeness and Le Tréport route to the Continent is realised, it will be the shortest between London and Paris. The line, which has been constructed by Mr. Walker at a cost of less than 7,000*l.* per mile, will probably be opened for public traffic in the course of the month of July.

Messrs. Barnard, Bishop, and Barnards have sent us three of their Illustrated Price Lists, those namely of their "Carved Wood Mantel-pieces," "Plain and Art-Painted Tiles," and their "Low Combustion Stoves." This firm first got a name out of their own town by the excellent wrought-iron gates they sent to one of the Great Exhibitions, of which we gave an illustration at the time, and they have continued to maintain a good character for the art employed in their manufactures. The low combustion stoves, introduced by them, have found imitators. Their "art-painted tiles" are much better in design than many we have seen. In fact, as a rule, the productions of this firm are very satisfactory.

"Scientific Evidence."—Judge Hutton, of the Oldham County Court, appears to have a very poor opinion of the value of the evidence of experts, or as it is sometimes called, "scientific evidence." In a case that came before him last week, counsel expressed regret that scientific evidence was not adduced. Judge Hutton; —"Oh, no; I am very glad there is none. As Earl Cairns said in effect, these scientific witnesses cannot be indicted for perjury, and generally say what they are paid to say."

North Wales Slate Trade.—The depression in the slate trade still continues without prospect of improvement. At Lord Penrhyn's Carnarvonshire quarries the output is still limited to four days a week, and much distress prevails in the district. It is hoped that much of the surplus labour will be absorbed in the construction of the new line of railway connecting Bangor with Bethesda, which is about to be commenced. At the Llanberis quarries full time is still worked, but the staff of workmen has been reduced and the wages lowered.

International Sanitary Exhibition.—The arrangements for this Exhibition are now complete. The offices are removed from the Parkes Museum to the Exhibition buildings at South Kensington. The Right Hon. Earl Spencer, Lord President of the Council, has accepted the office of president, and will preside at the opening ceremony on Saturday, July 16th. The Exhibition is to be complete on Wednesday, July 13th, and the judges will make their examinations for the awards on the two days previously to the opening.

Great Strike of Nailers.—The whole of the wrought-nail makers of Blackheath, Rowley, Dudley, Sedgley, Gornal, Old Hill, and Bromsgrove, have ceased work, in consequence of their demand for an advance of 30 per cent. not having been granted. The operatives number 30,000 men and women. Mr. John Price, the Secretary of the Nail-makers' Association, says that the present rate of nailers' wages is about 47½ per cent. lower than in 1875.

The British Legation, Athens.—We understand that Mr. James Hill, of Upper Thames-street, has just shipped a considerable number of his improved locks and door-fittings to Athens, for the New British Legation Buildings; and, we believe, the order is the result of a former shipment to Athens for Dr. Schliemann, which gave both him and his architect great satisfaction.

Architecture, University College.—Mr. T. Roger Smith, F.R.I.B.A.:—

Construction, Second Series. Donaldson Silver Medal: A. W. Glasson, of London. Prize. T. R. Clemence, of London. *Second Class.* G. Havill, of London. *Third Class.* A. Gillespie, of Blackheath; H. W. Teed, of London; Charles Turner, of London. First Series. Prize. H. C. Clarke, of London. Certificate 2.° F. A. Gerrish, of London. *Second Class.* F. C. Nichols, of London; G. C. Nichols, of London. *Third Class.* John Briggs, of London; E. Crisp, of London; H. W. Parkinson, of London.—*Fine Art*, Second Series. Donaldson Silver Medal. A. B. Cottam, of Watford. Prize. A. W. Glasson, of London. *Second Class.* C. J. Tait, of London; K. Tatsuno, of Japan.—*Modern Practice.*—Prize. A. Ashbridge, of London. *Second Class.* C. H. Bedells, of Crouch End; W. J. Lander, of London; C. E. Pertwee, of London; A. B. Pite of London. *Third Class.* J. D. Butler, of London; W. Grellier, of London; W. A. Pite, of London.

The students in the first and second series were, this year, examined separately. Several of them passed creditably on both occasions; but, following the precedent of other years, the Council of the College have only granted to such students a certificate or prize for the more important of the two examinations. The award of the Donaldson medal was made by Professor Lewis; that of the other prizes was made by other architects familiar with examination, at the request of Mr. Roger Smith.

Croston.—The foundation-stones of a new Wesleyan chapel at Croston, near Ormskirk, have been laid. The new chapel will be built on the eastern side of Westhead-road, on a freehold site given by Mr. W. Woods, of Croston. The style will be Gothic. The walls will be built of Croston bricks, and all outside walls will have a 3-in. cavity. The front and sides will have Longridge stone base courses, cills, strings, buttress weatherings, and moulded labels round window and door arches. The whole of the internal woodwork will be of the best pitch-pine, twice varnished. The chapel will seat 300 persons. The plans have been prepared by Mr. S. Hurst, of the firm of Messrs. Maxwell, Tuke, & Hurst, architects, Southport, and the works will be carried out under the architect's personal superintendence. Mr. W. Vaughan, Southport, is the sole contractor. The entire cost will be about 1,200*l.*

Peckham.—The foundation-stone of the New Unitarian Chapel in Avondale-road, Peckham, was laid by Sir James C. Lawrence, bart., M.P., on the 23rd ult. The style adopted by the architect, Mr. Henry G. Brace, of Chancery-lane, is Early English, and the materials used externally will be red brick with stone dressings. The chapel will hold 250 persons on the floor-level, and 50 in the gallery. Internally, the facing will be of Luton brick, with red bands, and open timber roof. After the ceremony above recorded, the school-room, just completed in connexion with the chapel, was formally opened. The room is 33 ft. by 50 ft., with stock-brick facings, and red bands internally, with roof partly open. The builders of the chapel are Messrs. Hoare & Son, and of the school, Messrs. Watson & Dennett.

Jubilee of King's College.—At a meeting, held at Willis's Rooms on Midsummer Day, the Archbishop of Canterbury in the chair, it was resolved to commemorate the jubilee of King's College by the erection of suitable buildings in which to carry on the work of the institution in connexion with the higher education of women. Canon Barry, the Principal of the College, stated that the cost would be 20,000*l.*, of which sum more than 3,000*l.* has already been raised. An appeal is made to the public to support the scheme.

International Exhibition of Machinery and Tools at Liege.—Readers will find in our advertising columns notice of an International Congress of Contractors, which is to be held in Liège on the 24th, 25th, and 26th of July. In connexion with the Congress there is to be an exhibition of machinery, engines, tools, and building materials, which will remain open until the 31st of August. We invite attention to the particulars given, as we have reason to believe that the enterprise is undertaken with the most satisfactory auspices.

New Infirmary, Shoreham.—The Steyning Union Rural Sanitary Authority are about to erect a new infirmary in two blocks, for male and female patients, at the workhouse, Shoreham, Sussex. The works will be carried out under the superintendence of Mr. S. Johns, district surveyor, Portslade.

Painters' Wages at Oldham.—The Oldham painters have returned to work on the old terms, after having struck for an advance of one half-penny per hour.

Sculpture.—The Corporation of the City of London have commissioned Mr. C. B. Birch, A.R.A., to execute a marble bust of the late Earl Russell to be placed in the Guildhall. The Council of the Sydney International Exhibition have awarded to Mr. Birch the first medal and diploma for his bronze group "Retaliation," which has been purchased for the Sydney National Gallery.

TENDERS

For construction of Main Drainage and Outfall Works at Leyland, Lancashire, for the Leyland Local Board. Mr. Wm. Wrennall, engineer:—

All statements of facts, lists of tenders, &c. must be accompanied by the name and address of the sender, not necessarily for publication.

We are compelled to decline pointing out books and giving addresses.

N.B.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

NOTICE TO SUBSCRIBERS.

THE INDEX and TITLE-PAGE for Volume XL. (January to June, 1881), will be given as a Supplement with the next Number.

A COLOURED TITLE-PAGE may be had, gratis, on personal application at the Office.

CLOTH CASES for Binding the Numbers are now ready, price 2s. 6d. each; also

READING CASES (Cloth), with Strings, to hold a Month's Numbers, price 2s. each.

THE FORTIETH VOLUME of "The Builder" (bound) will be ready on the 12th inst. price Twelve Shillings and Sixpence.

SUBSCRIBERS' VOLUMES, on being sent to the Office, will be bound at a cost of 2s. 6d. each.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS TRADE, AND GENERAL ADVERTISEMENTS.

Six lines (about fifty words) or under ..... 2s. 6d.
Each additional line (about ten words) ..... 0s. 6d.

Terms for series of Trade Advertisements, also for Special Advertisements on front page, Competitions, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.

SITUATIONS WANTED.

FOUR Lines (about THIRTY words) or under ..... 2s. 6d.
Each additional line (about ten words) ..... 0s. 6d.

REPLIES TO ADVERTISEMENTS,
Addressed Box —, Office of "The Builder,"
Cannot be forwarded, but must in all cases be called for, and the Office Receipt produced.

THE CHARGE FOR A BOX IS AS UNDER:—
For "Situations Wanted" Advertisements ..... 3d. per Week.
For all other Advertisements ..... 6d. per Week

PREPAYMENT IS ABSOLUTELY NECESSARY.

. Stamps must not be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, King-street, Covent-garden, W.C. to

DOUGLAS FOURDRINIER, Publisher,
Addressed to No. 46, Catherine-street, W.C.

Advertisements for the current week's issue must reach the office before THREE o'clock p.m. on THURSDAY.

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied *direct* from the Office to residents in any part of the United Kingdom at the rate of 18s. per annum, *prepaid*. Remittances payable to DOUGLAS FOURDRINIER, Publisher, 46, Catherine-street, W.C.

Best Bath Stone.

Alfred Stevens.

BIOGRAPHY of Stevens is a welcome book. Since the world at large awoke to the knowledge of the genius who had gone, there has been a demand to know something more of that hermit whose Thebaid was up Hampstead-road.

We have heard of one being in course of preparation by one of his pupils; and trust soon to have such a work as shall give the man's inner life, show the methods in which he worked, the steps by which he rose; and, for the instruction of those coming after, shall multiply and perpetuate a representative series of instances of his marvellous mastery in art.

We believe the public is indebted to Mr. J. Comyns Carr, the spirited English correspondent of *L'Art*, for the idea of publishing some illustrations showing this, with an accompanying narrative, in that journal. This account, by Mr. Walter Armstrong,* appears to have been collected from various notices in the public papers, from ourselves among the number, without any acknowledgment of the fact. It would be interesting to know how much intercourse he had with the subject of this study, as some statements in the book could scarcely have been written by one who had possessed the advantage of knowing Stevens intimately.

The present work reproduces nearly all the illustrations which appeared in *L'Art*; the letterpress is rather more than a mere translation from the French account [though in the absence of any preface we do not gather which was written first], as the division of paragraphs is altered; several of the errors in the latter are here corrected, and the details are also fuller in many instances; but there are traces of the *feuilleton* style, and a tendency to present facts in a picturesque light, which detract from its value as history.

A book on such a subject is unusual here, though common enough on the Continent; and we owe a debt to the foreigners for their ungrudging appreciation of our great artist. The publication is so admirable in intention and in so good a vein, that we hesitate to find fault; and yet there are several points to which we must draw attention, in the hope that, whenever another edition appears, with a memoir written with more knowledge of the man, these may be corrected.

The value of the work is further marred by careless editing: there is no division into chapters, the subjects are not treated of in chronological or any other order that we can discover, dates are omitted where they would be useful, and there is no index to subject or to illustrations. The paragraphing and punctuation do not conduce to easy reading; and the typographical errors on pp. 2, 19, 22, and the mis-spelling on pp. 27, 42, and 47, are not creditable to the publishers. We would remind the writer that the Italian names he uses are spelled *Buonarroti* and *Correggio*; and that the church at Venice is dedicated to *Santi* Giovanni e Paolo; also that *cognoscenti*, *ensemble*, and *verve* are still considered as foreign words, and treated as he treats "*chefs-d'œuvre*." The possessive case is clumsily put twice on p. 11, and the expression on p. 15,—that the money provided for the Wellington Monument "happily proved to be less than a just equivalent for what the nation received,"—is an odd way of putting the case. Perhaps it is meant,—that the nation happily received far more than a just equivalent for the money,—which is another proposition entirely. We also think that "became saturated" would be in better form than "saturated himself" in p. 4; and perhaps there is an s too many in the last line but two of the book; and "Lady Ashburnham" on p. 21 should be "Louisa Lady Ashburton."

The illustrations are the principal feature of the book: those by R. W. Macbeth and Ch. E. Wilson are very good, also some of those by J. Watkins. They are neither inserted in any relation to the descriptive letter-press nor numbered; and hence reference is difficult. The titles have remnants of French on pp. 2, 3, 20, and 31; and are also incomplete, for, while giving due prominence to the name of the draughtsman in all cases, they do not always state whether they are from the model, from the executed object, or from a drawing by the master himself; and evidently the words "Portion of" should be added on p. 41.

The Study deals with certain incidents and works of Stevens's life. We leave the reading of these in detail to our readers, and proceed to note only some of the incomplete statements.

Mr. Armstrong mentions Stevens's subtlety in the management of light-and-shade, in making some drawings on stone for lithographs to illustrate Professor Cockerell's monograph of the Angel Choir at Lincoln; but he seems not to have been aware of a far finer instance of this power in the lithograph Stevens made of the sculpture in the pediment of St. George's Hall, at Liverpool. The preliminary drawing in Indian ink is, we believe, among the treasures of the South Kensington Museum, but we have seen a copy of the lithograph in the Library of the Royal Institute of British Architects. In the title to this, which mentions everybody all round, the one name of Stevens himself, conspicuous by its former absence, has been added in pencil by a later hand; this keeping in the background was one reason of his want of worldly success. The sculpture, as it was designed by Cockerell and carved by a contemporary sculptor, left a blank space at each end of the tympanum, perhaps from the difficulty of designing figures for spaces so confined; but Stevens in making the drawing supplied the two figures at each end. These had the cordial approval of the Professor, and it is hard to imagine the effect without them now. We commend this lithograph to the notice of our readers, and would ask,—how many of our leading architects could make such a design and such a drawing?

As might be imagined, an account of the Wellington Monument in St. Paul's Cathedral, with all its sad concomitant mistakes and troubles, occupies a large part of the biography. The writer does not tell the tale, perhaps because he did not know it, of the days when Stevens, with his assistant, Mr. William Ellis, now of Sheffield, worked on the competition for the Government offices and the monument; how when the last day for sending in the latter arrived, as ill-luck happened, it was a general holiday; and, as no arrangement for a van to take it had been made, Ellis spent the whole day, till late in the evening, hunting about for one. At length one was found, planks were placed from the window-cill to the area railing the van was backed on the footpath, and the model was slid down in three pieces. Then Ellis accompanied it, and arrived at Westminster Hall at three minutes before midnight. Springing down, he gathered together a few workmen and porters who were coming away, and dragged in that model which was to lead to Stevens's fame, and give to England the supremacy in Art, just as the bells were striking the close of the day. This procrastination was a failing which has descended, along with greater or smaller portions of his mantle, to some of his pupils.

The design, which we have illustrated and described (vol. xxxiii., p. 686), was much criticised at the time, so different was it to the usual "Sculptor's Monument." The recipe for outdoor monuments appeared to be blocks of granite with figures at the angles; while our indoor ones, with dying heroes, groggy Neptunes, and dyspeptic lions, are scarcely much better; and all will be glad that an opportunity was given to a complete artist to show how a great monument may be treated. We have borne witness to its admirable design (vol. xxviii., p. 637), in our columns.

With regard to the *motif* or prototype of the design, there is, however, a word to say. The writer states, "the favourite reference is to an altar-tomb in the choir of San [*sic in orig.*] Giovanni e Paolo at Venice," and he describes a tomb which "consists of a sarcophagus supporting a recumbent figure and surmounted by a

* Alfred Stevens. A biographical study. By Walter Armstrong. Remington, New Bond-street. 1881.

canopy," &c., and he then proceeds to say "there is an appreciable similarity in their minor architectural details, but there all resemblance ends." We were the first to make the suggestion (vol. xxxiii., p. 405), since adopted by others, about this *motif*,—we mentioned "the *high altar*," he alludes to *an* "altar in the choir,"—and he shows he has mistaken the monument by his description, given above, which tallies with the Vendramin monument (illustrated in Yriarte's book on Venice a short time ago). The altar, to which we referred, and described as the work of Carmero, dated 1610, *has no sarcophagus and no recumbent figure!* The date should have shown that the work of Leopardi could not be intended; but it is dangerous to prophesy unless you know. A nearer copy of the Venetian work is to be seen in Mr. Gribble's design for the Baldacchino in the new Oratory at Brompton. If Mr. Gribble could favour us with his measured drawings from the original, our readers could judge for themselves.

In speaking about the position of the monument, the writer says, justly enough, that Stevens did not disapprove of it; but we in common with others have regretted it (p. 456, In vol. xxxvi.), and do so still If the wooden screen which separates the court from the south aisle of the cathedral could be reduced by taking away the pediment and the four centre columns, the effect from the nave, which is where the spectator must stand in order to judge of the proportions, would be much improved. We might express a hope that this should be done; but we understand that when the Royal Institute of British Architects visited St. Paul's, at the time of the Conference four years ago, and the president, Mr. Charles Barry, asked a question about it, the answer was not encouraging. As it is, the dark wooden pediment, &c., cuts the design into two parts in a manner which must be regarded as most unfortunate.

Exception is taken to the head of the figure of "Truth." His pupil Stannus, who was employed to finish the few remaining details of the work at his decease, would certainly not touch so important a part as the head of this figure, even had it been left rough; but it was *complete*, as we now see it in the model at the South Kensington Museum, and, indeed, looked at as a representation of the simplicity and ingenuousness of Truth, without any distorting emotions, it has a nobleness and an appropriateness of expression which make it worthy to be placed by the side of the sister group, and, perhaps, of any other group in the world.

We note Mr. Armstrong's appeal for the completion of the work: we understand the model of the equestrian statue of the Duke, rough as it is, is carefully preserved, and could be available. We have all along said it would be better to take it as it is than to invent another finish of a different idea. In this we are supported by Mr. Fergusson, to whom, it should be more generally known, was due the "happy thought" of getting back Stevens to finish the work through Mr. Collmann. Mr. Fergusson also contributed towards the completion by the weight of his approval, and by the sacrifice of his time in a manner which will not be appreciated till the whole history is written; and he has earned a right to speak on this subject. In his letter to the *Times* of June 26th, 1878, he said he had reason to believe that the late Dean Milman's objection was not shared by the present Dean and Chapter; and he pleaded that "The Horse and his Rider" might be placed on the "gorgeous elaborate pedestal for a statue which is still wanting." As long ago as 1876 Mr. Comyns Carr made an eloquent appeal to the same effect; and a memorial signed by many artists was presented to the then First Commissioner of Works, but without effect, as it turns out; and, as a change was made in the office shortly afterwards, it is possible that it was forgotten. We hope, when the Government have a little leisure, that it may be able to consider this, and to spare the 2,500*l.* necessary to complete what will be then "the finest sepulchral monument of any age."

In the recital of the subsequent business, when the commission was given, there is a straining after effect in the statement that the Government sent for his signature an *agreement* which bound him to complete the work for 11,000*l.* No agreement was sent, but in a letter of the 9th of September, 1853, he was authorised to proceed on a condition that it should be done for that amount; the letter, however, contained this important statement that, excepting that the monument was to be in accordance with surrounding architecture to the approval of Mr. Penrose, he was left "entirely unfettered as to the composition of the design." The writer does not quote this, though it entirely qualifies the whole transaction, and shows that Stevens was at liberty to have simplified the first design or make another more suitable to the reduced amount. It is quite possible to imagine that a simpler design, still showing all the grand excellencies of the present monument, could and would have been made by Stevens had he then realised the sad and bitter experience he afterwards possessed.

What followed is traced with more or less accuracy and detail; but as the public has heard enough about it, we will only allude to one point—the conduct of Mr. Ayrton. It became fashionable for a certain set of writers to launch their shafts at this gentleman; and, of course, he is made to come in for some heavy blame for his treatment of Stevens. But after all is said, it may be urged that the artist's mode of procedure, after he recommenced work upon the monument under his contract with Mr. Collmann, was the best justification of Mr. Ayrton's measures. The latter may have been arbitrary in manner; but some allowance will be made when the fact is considered that Stevens had been engaged for eleven years, and none of the models for the sculptor's work were ready, and the whole thing had become a standing joke in the House of Commons. When Stevens realised that thereafter payment would be made not on promises but on work done and actually delivered, he finished the various parts; and at the time of his decease had completed nearly everything: so whatever may have been Mr. Ayrton's shortcomings as to manner, the fact remains that through this act, or as a result of it, the work was really completed before Stevens's death; and it may be doubted whether it ever would have been except under similar pressure.

The question is asked on p. 37, "Was Mr. Ayrton's conduct judicious and to the benefit of the public service?" with the answer, "We declare most emphatically it was not." Perhaps the *result* is the best test; we admit all that can be said about genius, and we all along pleaded for consideration in Stevens's case, but the line must be drawn somewhere.

Mr. Armstrong airily says Mr. Ayrton looked into the state of things at Stevens's first request for money [which came before him], and ordered the experts of his department to make a survey and report, and upon that report he determined that "such a state of things could not be suffered to exist for another day"; that he demanded the surrender of the models, &c., which were "boarded up and sealed," and he also re-quotes the epigrammatic "short way with artists." The whole of this is somewhat misleading,—unintentionally, no doubt; but let us look at the dates. In September, 1869, Mr. Stevens applied for a further sum on account, which was paid. On April 9th, 1870, *i.e.*, seven months afterwards, Mr. Ayrton inspected the works, and being dissatisfied, he ordered the survey, which was duly made, and dated May 31st. The letter which determined the contract and required possession of the models, &c., was sent on July 20th, and, after much rather one-sided correspondence, including a letter dated August 2nd from the Office of Works, to which Mr. Stevens only sent a reply on October 25th, after five requests for one, the models, &c., were delivered upon the 14th of November,—*i.e.*, another seven months from Mr. Ayrton's visit, or fourteen months after the request. The expression "not for another day" does not compare favourably with these facts. An enclosure, with door and padlock merely, was certainly fixed up at one end of the large studio; but as it was only 6 ft. or 7 ft. high, it is obvious that Mr. Ayrton trusted more to Mr. Stevens's honour than to "seals."

We have no sympathy with high-handed acts by any one; but to make Mr. Ayrton the scapegoat, and to repeat the insinuation about motives for his appointment, are scarcely worthy of the rest of the book. The fact is,—and be it sorrowfully stated,—that the fastidiousness of the artist must have blunted his sense of obligation. Promises seemed of no moment; and those who knew him best made their calculations and applied pressure accordingly. We know of one gentleman to whom he had promised, after much procrastination, to have some work really ready "in three days," who waited for a month, and then sent a porter every day with instructions to wait for it. Stevens's answer to the porter on the first two days was that the painting "was wet and it could not be rolled up," when it had not been commenced! The daily visits, however, resulted in the porter bringing the long-desired work home in triumph on the eighth. One of his pupils, to whom he had promised a spare duplicate cast, "the next time he came," called three times, and on each occasion was put off till the "next time": on the fourth visit a Hansom cab was engaged in the neighbourhood and drawn up before the window to show the master his word was relied on. This piece of mute eloquence produced the desired result. Again, we hear of a wealthy patron, who had paid him for some work and could not get it out of his hands, having to resort to a lawyer's letter (kindly intended, however), to spur on Stevens to let the work go, for the patron knew that its non-delivery was due, not to indolence, but to that excessive fastidiousness which it was thus hoped to overcome. His neglect to proceed with the execution of the bronze doors for the Jermyn-street Museum, for which we are told, on p. 11, he had received the commission and a small payment on account; and his procrastination in the matter of a diploma for the 1867 Exhibition, both resulted in loss:—to him of the commissions, and to the world of two fine works. These are cases out of numbers: perhaps similar anecdotes could be related of other great geniuses; and these are given, not to damage Stevens's character, but to show that at Mr. Ayrton's advent, the Office of Works had begun to understand the man they had to deal with.

In connexion with this episode the silly story about Mr. Ayrton's likeness is reproduced. This, if correct, would only show ridiculous spite on the part of Stevens, which was foreign to his nature; but we can say that the fact is otherwise, as, indeed, any one may see on examining the work at St. Paul's.

One of Stevens's most munificent patrons was Mr. R. S. Holford, of Dorchester House, Park-lane, to the magnificence of whose palace Stevens, among others, contributed. Illustrations are given from some of the works executed for him; but there is no attempt at any account of their evolution or of the relations between the two men. The dining-room mantel-piece is the subject of three illustrations on p. 10, and on pp. 6 and 7. These show the unsightly block intended to range below the lower fascia of the architrave, which might have been left large in the marble for protection of the arrisses, but certainly now requires reduction in the projection, as may be seen in the model at South Kensington Museum, where the works of Stevens may be conveniently studied.

Stevens's design for the decoration of the dome of St. Paul's is described, and reference is made on p. 27 to "our illustration," as showing one bay of the design. We fail to find the illustration. It is a matter for congratulation that this model has been acquired by the Dean and Chapter, instead of falling into private hands. A full-size experimental cartoon is being worked out from it by Mr. E. J. Poynter, R.A., and Mr. Stannus, while Sir F. Leighton, P.R.A., assists with his judgment and is painting a composition for one of the circular panels. We understand, from what has passed, that "the curiously built-up rib," to which the writer refers, is to be somewhat modified; and we hope that when tried up next spring the result will be satisfactory, and such as will tend to the worthy adornment of our only Classic cathedral. We do not, however, commit ourselves to the expression of any opinion as to its fitness, at the present moment.

No mention is made in the book of Stevens's great admiration for and study of Flaxman in his earlier days; yet this was one of the elements in his art education. There was much in common between the two minds. Flaxman appears to have sunk into forgetfulness of late years in England, but in France he is considered and studied as the representative English sculptor, probably for the beauty of his line composition.

We are informed in the book that what is there termed "the constructive inferiority" of Gothic was displeasing to Stevens; and that he used to say that "as the round arch is the strongest method of bridging over a space, a pointed one must be a lie. . . . ." We do not gather from the history who it is that used the term "constructive inferiority"; if it were Stevens, and if he really did ever make the second remark which has been told to the compiler, they could only be instances of narrow

one-sided dogmatism, with which we learn from p. 45, he had no sympathy, and unworthy either of the man or of repetition in the book.

We also think the statement on p. 26, that he felt slighted because Mr. G. F. Watts, R.A., was asked to prepare a design for one of the spandrel panels in the dome of St. Paul's where his Isaiah was up, is scarcely kind to his memory; and we question its accuracy. We have it on the authority of one of his more intimate pupils that he had more generous feeling towards brother artists, that he always spoke of Watts and his work with appreciation, and that he regretted that Watts had not (like himself) made a full-size cartoon instead of leaving the enlargement and re-drawing to workmen.

The estimate of his art is sympathetic and penetrating; it well says:—"Stevens was a man born out of due time, a man who, in the wrong country and the wrong century, amid many discouragements and with but little help from public sympathy, carried to perfection a work left incomplete by the Italians of 300 years before." This work, we take it, was the welding together of the dissevered arts which, in the age of specialists and the "Division of Labour," had become separate, with such lamentable results in each. An Architect is all the better and truer an architect if he have practical knowledge of sculpture; a Sculptor is stronger by reason of such curb as the chief-art brings; while each is richer by the union of their sisters, Painting and Ornament: when a man unites these in a degree like Stevens, he becomes one of those to whom "Giotto will give his hand, and lead into the white circle, and say, 'This is our brother.'" Much has been said by critics about originality, meaning probably novelty; there is a kind of novelty pleasing to lesser minds, which remains so because the greater pass it by. Great minds work along the lines of development, widening and deepening the current: lesser ones start on erratic courses, leading to eddies on one side or stagnation on the other, and are left behind and forgotten, while the greater ones help onward the tradition from age to age. It is too soon yet, we hold, to assess Stevens's position; but, when people are shaken down to their proper levels, we believe his name will be prominent in the great pedigree of art.

The account of Stevens's later days and death forms one of the saddest pages in the life of this talented man, though it is not dealt with in the Biography: with hair growing grey, and the unmistakeable traces of premature age upon his beautiful Classic face like Keats' he struggled on, working on the group of "Truth and Falsehood," which he did not live to finish,—compelled to take rests by that illness he tried to disregard,—and yet building up and bringing forward, simultaneously, the model of that equestrian statue which had been objected to, and was not ordered; receiving the visits of those who enjoyed his friendship with a weariness of manner even as he made them welcome, and, inquiring about their various work, gave invaluable help in the kindly and modest manner which made him beloved by them. The time went on, he being more at ease after the financial burden had been taken off his back by his kind-hearted friend, Mr. Collmann, since gone to his rest also; and all were in hopes of his "pulling through," getting the work done, and then reaping the reward which the English public, though it grumbles, would have given,—when they were startled by the news of his death, and read the pathetic extract from his letter given in our columns of the 8th of May, 1875, which he had penned on the afternoon preceding it; and, as the Tuscan has it, they felt the sun was blotted out.

It has been the intention of the enterprising publishers of the book before us to keep the memory of Stevens green. We trust it may be ever so in the hearts of all who love singleness of purpose and devotion; if we have ventured to point out mistakes in the attempted Biography and failings in the Man, it is with the desire to speak of him as he was,—to "nothing extenuate nor set down aught in malice." His very failings were virtues run to seed; and any presentment of the man without them would be incomplete.

It is refreshing to dwell upon the character and work of a man who had an ideal and clung to it, in these latter days of hard brutal materialistic realism: such men are preachers, crying out that there is a somewhat else than to-day and to-morrow and the next day; and while heartily thanking the publishers for giving us this book, we commend it to our readers as a beautifully illustrated volume, the price of which really puts it within the hands of every art-student, and that is where it should be.

CHARITABLE AND PAROCHIAL ESTABLISHMENTS.

UNDER this title Mr. Saxon Snell, who has had large experience in planning and designing buildings of the class indicated, has published what is a very useful and practical book.* No architect can do anything more to the purpose in the way of publication than to give the results of his experience in dealing with any class of buildings of which he has had the responsibility. The author appears to have undertaken the task in the right spirit. He submits to criticism, he says in his preface, "not without considerable hesitation," a selection of executed and unexecuted designs illustrating attempts to solve the question, How best to arrange buildings for the accommodation of the poorer classes of the community? But, as he observes, no such work has been published, and if his plans do not solve the problem, they form, at any rate, a very useful contribution to it, which will be the more beneficial if others are induced in a similar manner to give their experiences.

Before quitting the preface, we may give further currency to one paragraph of it, which touches on a subject much needing consideration at the hands of those who are concerned in promoting such buildings. One of the greatest difficulties, Mr. Snell observes, which an architect has to contend with in planning public buildings of this class is the disinclination of his clients to contemplate any but immediate wants. "If, for example, their present establishment consists of buildings erected 150 or more years ago, and one portion having fallen into decay has to be rebuilt, they will not be told that, as in the natural course of things the rebuilding of the whole structure must sooner or later follow, it would be advisable to prepare a design for its ultimate reconstruction on more modern principles, and in such wise that the part to be immediately rebuilt may form a congruous portion of the future new establishment. The result is that the planning of the reconstructed building is in many respects defective, even though the architect may have done his best by anticipation to minimise the evil." And, unfortunately, the architect who gives this sensible and prudent advice will be supposed by many people to have his own interests in view in suggesting the preparation for a larger scheme. The general statement here made, however, cannot be so misunderstood, and we strongly recommend it to the consideration of Boards of Guardians.

The buildings which are illustrated in this work might be broadly divided into two classes: those in which it is right and desirable that the inmates should be made reasonably comfortable, and the building to some extent attractive and cheerful; and those sad and dreary structures which represent only the official provision for giving shelter to persons who for the most part have little claim on the goodwill of their fellows beyond the fact that, as Macbeth puts it, "in the catalogue they go for men," or women. For this class of persons, shortly classified as "tramps," and who for the most part are probably persons who will not do honest work except upon compulsion, the buildings called "casual wards" are provided, and grim enough structures they are. Still, the plans and provisions of these buildings, as illustrated in Mr. Snell's book, show the possibility of a vast improvement on the state of things described a good many years ago by the journalist who earned a curious kind of fame as the "amateur casual." Those who claim refuge in the casual ward as illustrated in this book must at least be compelled, though by rigorous and mechanical means, to undergo for once the experience of orderly arrangement and good ventilation. The "St. Marylebone Temporary Casual Ward" provides a row of sleeping-berths raised from the floor, and divided by low stall-boards, and is warmed by hot-water pipes, and ventilated by fresh-air ducts. On the walls and roof-timbers are painted a few simple and straightforward passages from the Bible,—"Thou, God, seest me," "Let him that stole steal no more, but rather let him labour," &c., which may occasionally, perhaps, remain in the mind of some waif and stray who can read, and who is not quite given over to good-for-nothing-ness. But this plan of casual ward has now been superseded for the most part by one which entails the separation of each inmate from the rest, from the time of entering at night to the time of leaving in the morning. It is, in fact, exactly like a prison, entered voluntarily, but from which exit is not permitted till the allotted work is done. Each man is placed in a separate cell with a bed and a small window of inspection opening on the central corridor, and as an anteroom to his sleeping-berth, is a square labour-cell, in which he will find a certain amount of blocks of granite, which he must break up, and pass out the whole amount broken through a grating in the outer door, before it will be opened for his exit. There seems something dismally harsh in giving men a night's lodging on such terms and under such conditions; but we presume the evils of intercommunication in the old wards between bad characters, or between the worst and those who are not so bad, have been found too serious to be ignored. In the similar establishments in which the work consists in picking oakum, and, in the women's department of the one we have been mentioning, the "labour cell" is not required, the work being done in the sleeping-room. A building on a somewhat similar plan is given, which was planned for a M. Ragosine in Russia, and built at Nijny-Novgorod-on-Volga, as "Lodgings for Houseless Poor." This consists of three long blocks of dormitories arranged in T-shape, two of them for men and one for women, with the waiting-rooms for applicants of either sex placed at the intersection of the blocks. These blocks consist of rows of separate cells, each with a bed and a separate external window, opening out of a centre corridor; at the end of the corridor in each block are the water-closets, divided from the dormitory by a ventilated lobby. This plan the author recommends as very suitable, with slight modifications of detail, for a London casual ward plan. A larger centre block would in that case be required, or part of each wing would have to be appropriated, for the bath-house, which is a *sine quâ non* in a casual ward, and through which alone can the sleeping lodgings be reached.

This class of buildings, however, only occupies a small proportion of the publication, which is chiefly devoted to the illustration of workhouses and workhouse infirmaries; buildings on a large scale, and in some of which a certain amount of architectural effectiveness is aimed at and obtained. Some of these have been illustrated in our pages. The first plan we come upon is rather a startling one when considered in relation to the now generally accepted theory and experience as to the planning of sick wards. This is the plan of the infirm wards at St. Marylebone Workhouse, and in order to utilise a limited space for the greatest possible number of inmates a plan was made in which the cross ventilation and lighting is from either end of the ward and the beds are placed in rows against the side walls where there are no windows, and two rows down the centre, head to head and separated by a screen. At first glance it would seem that this was a most unsanitary and unscientific plan, and the author admits that he had great difficulty in getting the Local Government Board (then the "Poor-Law Board") to sanction its erection, which they eventually did only on the expectation that it would be pulled down when the lease, which had only twenty years to run, had expired. The architect was quite alive to the fact that his plan was one which sanitarians would be disposed to condemn, and he seems to have been put on his mettle and made up his mind to show that he could render the rooms sanitary. We quote his own statement:—"Inasmuch as it had been predicted that it would be impossible to properly ventilate a building constructed on such a plan, very great pains were taken to make ample provision in this design for the inlet of fresh air to the wards and the outlet of foul air, and to this end channels were constructed from the front to the back walls running under the heads of all the beds, for the admission of fresh air, and the side walls next the beds, being made two bricks thick, were filled with upright flues, 18 in. by 9 in., for carrying away any vitiated air to above the level of the roof. As a further precaution, a boiler was erected in the basement, and steam-pipes passed through all the above flues in order to better induce an upward current in them. This apparatus was, however, soon dispensed with, as the natural ventilation was found to be sufficient." With all these

* Charitable and Parochial Establishments. By H. Saxon Snell, F.R.I.B.A., &c. B. T. Batsford, London, 1881.

special precautions a great deal of the disadvantage of the plan was no doubt removed; but this does not alter our opinion that end-lighted sick-wards are not desirable. Nor can we entirely approve of the planning of the water-closet department, with the closets also against an inner wall, and in a very confined situation. The statement of Dr. Bridges, the Local Government Board Inspector, that it is difficult to speak of the general arrangement too highly, only seems to show that the Inspector has something to learn on the subject of planning and arranging such buildings. As far as the architect's part is concerned, we must take it that the arrangement of the plan arose partly out of difficulties in regard to space, but we should not recommend adopting this plan as a precedent, in spite of its having proved, owing to the various precautions mentioned, less objectionable than might have been expected. It seems to have been repeated in the Holborn Union Infirmary (the plans of which are given), at the wish of the Guardians, though "the Local Government Board objected to such an innovation in hospital construction" (or, rather, to such a return to an exploded arrangement), and rightly, to our thinking. After a long controversy, it was decided that some of the wards should be built on this principle (the "Infirm Wards"), and those for more serious illnesses on the pavilion system, and this compromise was adopted. We should observe that the bow-windows with seats in them, which form a feature in Mr. Snell's infirm ward plan, are a very pleasant addition to the room, while they have the constructional advantage of assisting the stability of a long length of wall without cross walls.

The majority of the other large plans given in the book are on the pavilion system, and present no very special matter for comment, or at least none for fault-finding. They, can, in most respects, claim to be excellent model plans, and are worth the attention of those who are at all likely to be engaged in similiar work. There are several enlarged details of methods of warming and ventilation which are worth notice; and a very useful appendix in the shape of reprints from official documents, embodying Government recommendations or regulations in regard to the construction and arrangement of the class of public buildings dealt with. Under the head of data for cost, the author thinks it better to give merely cubical contents of some of the buildings, from which approximate estimates on the basis of present prices can be made; not only have the conditions under which the cost of the actual buildings was determined been very various, but some of them had been erected at such a ridiculously low cost that it would be necessary, says Mr. Snell, to complete the illustration, to say, "how soon after the completion of the works the builder became bankrupt, or compounded with his creditors."

Among the plans not carried out is one of some interest, consisting of an attempt to work out, into the form of a large Pavilion Infirmary, Professor Marshall's idea of circular wards. Seven of these the author has arranged in a semicircle, connected with a central administrative block by radiating corridors, flanked by nurses' rooms and other adjuncts. With circular wards this system may work well, and there is a good deal to be said for the circular ward in itself; but the author pushes it too far in saying that the same radiating system could equally be carried out with rectangular wards, according to a sketch-plan which he gives. This radiating plan has long been condemned for hospitals or asylums; for one reason, at least, if not for others, viz: that all the wards cannot possibly have a good aspect in regard to sun and prevalent weather; if some are good in this respect, others must necessarily be bad. With the circular form of ward this objection nearly disappears, or at least is much lessened.

One rather melancholy interest is given to the book by the fact that the frontispiece, a view of St. Marylebone Workhouse before reconstruction, is the work of a pauper inmate, bearing, we are told, a well-known artistic name; and the title is designed and drawn by a well-known architectural artist, also an inmate of another large workhouse. Here is one of the sad problems of modern life brought practically before us. Both drawings are very good, but the possession of these powers did not enable their authors to make a living by them, or preserve them from the melancholy position of dependence on official charity. How many more persons might be found, we wonder, among the inmates of large workhouses, who once held hopeful and apparently prosperous positions, and how came they to their present position? It would be an instructive chapter, if it could be truly written.

THE SEBASTIAN DEL PIOMBO OF THE NATIONAL GALLERY.

WE scarcely know whether to express pleasure or anxiety on finding that Sebastian del Piombo's famous picture of the "Raising of Lazarus" is at present in the hands of the cleaner. Certainly it is a matter of regret to find, on visiting the National Gallery, the empty frame which has so long contained the familiar work, without knowing exactly how long it may be before the picture is replaced, and without any knowledge or power whatever of obtaining in the meantime information of the processes to which it may be subjected. A picture of such extraordinary rarity, and whose history is so unusually well authenticated, and about which so much has been said and written, seems at the present time to call for something more than the mere notice that it is withdrawn for a time from the walls of the National Gallery. A great anxiety on the part of all lovers of old art is certainly excusable when we see so many instances round this empty frame where injury, very grave injury, has been done to the work of great artists. In what gallery of pictures, indeed, may this not be said to be the case? How is it possible that works naturally, if not exactly fragile, certainly easy of injury, should have escaped the influences of time in the many centuries of their existence? When we remember how rarely our own possessions, carefully tended as they may be, escape altogether the carelessness of servants or the want of watchfulness on the part of ourselves, must we wonder that even the most valuable pictures have scarcely, during the troublous times of past ages, escaped the injury certain to occur where objects have been little watched? On the contrary, we ought to, and very often do, wonder how they can have escaped destruction altogether. Personally, however, we have every confidence in the present Director and the Keeper of the National Gallery.

Sebastian del Piombo's "Raising of Lazarus" does not merely belong to the class of works generically classed as "old masters,"—works that the care of the past has bequeathed to us. It is one of the famous pictures of the world; it is bound up intimately with the history of art, in the edifice of which it may be said to be one of the principal stones. In the history of the National Gallery, again, it bears another interest. It is many years to look back, but we remember well the picture hanging on the walls of the house in which was formed the nucleus of our great institution in Trafalgar-square, when the National Gallery was still, if no longer in the possession of Mr. Angerstein, at least shown in his old house in Pall Mall, on the site where now stands the Travellers' Club. Then, as it still is, the Sebastian del Piombo was justly looked on as the greatest treasure of the collection of which it formed a part. It was No. 1 in the catalogue, and as such was long entered. It is to our collection, in fact, what the "Marriage of Cana," by Paul Veronese, the "Jocunda," of Leonardo, or the Giorgione of the *Salon Carré*, are to the Louvre; the "Madonna del Sisto" to Dresden; the Velasquez to Madrid; the "St. Cecilia" or the "Francia" to Bologna; the "Assumption" to Venice; the "St. Jerome" and the "Transfiguration" to Rome; the Raffaelle cartoons to our South Kensington; the "Sposalizio" to the Brera.*

Since Mr. Angerstein's time, if we remember rightly, the surface of the picture has been but little touched; the varnish which has become dirty is to be removed, and we are told that the beauty of the picture itself will be so increased by the removal that every one will be astonished.

Much as has been written about this famous picture, it is scarcely too much to say that it is the most deservedly celebrated picture historically in England, and it is likely throughout those extraordinary changes of what we thoughtlessly call "fashion in art" to hold its own in the estimation of the learned, and to retain that respect to which the work of the great artists of the Renaissance must be always entitled.

* Waagen, when he wrote many years ago, said of the "Raising of Lazarus," that it was "the most important specimen of the Italian school in England."

In what manner this picture is, as we have remarked, more intimately connected with the history of art than the crowd generally of other "old masters" is a story that has been told, it is true, more than once, but the occasion of the temporary disappearance of the work from the walls of the National Gallery may not be inopportune to tell again the connexion this picture bears with the emulative struggles of three great artists,—Raffaelle, Michelangelo, and Sebastian del Piombo.

Versions differ as to the exact origin of this picture. It would seem, however, that Cardinal Giulio de' Medici, when archbishop of Narbonne,—he was afterwards to rule as Clement VII.,—commissioned Raffaelle in 1519 to paint for his cathedral a "Transfiguration," and Sebastian del Piombo a "Raising of Lazarus." It can be understood that, in such a struggle, Sebastian's utmost emulative powers were roused. It is here that Vasari introduces the aid of Michelangelo, desirous to support a rival to Raffaelle, who, however, on hearing of the great Florentine's action, is reported to have written courteously his thanks that he was permitted the honour of competing not alone with Sebastian, but with one so great as he.* It is this historical interest, in addition to the intrinsic artistic merits of Sebastian's great picture, that has rendered it famous.

The collaboration of Michelangelo seems proved by Vasari, who, however often we may have to suspect the evidence of the amusing *raconteur*, would here have a right to be believed; we know him to have been the friend both of Michelangelo and of Sebastian, and he tells us distinctly that the "Raising of Lazarus," with several other works of the Venetian painter, were executed "*sotto ordine e disegno in alcune parti di Michelagnolo.*"

M. Reiset, in his interesting notes on the National Gallery, has drawn attention to a curious letter of Sebastian relating to the "Raising of Lazarus," and printed in the Life of Michelangelo, recently published at Florence. The letter, which is dated July 2, 1518, speaks of the picture as being on the point of completion. Sebastian had, it would appear, obtained from Cardinal de Medici the promise that the two pictures should be exhibited together. Raffaelle, we gather from this letter, had not at this time commenced his work, and Sebastian was unwilling that his rival should see his picture. *Credo che non vi farà vergogna.* The rest of his letter is somewhat painfully filled with complaints of the success of his rival. But if Sebastian imagined he was pleasing his friend by abuse of Raffaelle, he was, it is certain, singularly ignorant of Michelangelo's character. In no portion of that great artist's bulky correspondence (published some time since at Florence) is to be found, as M. Reiset remarks, a single word against Raffaelle, and that painter's respectful estimate of his great contemporary we have already seen.

Sebastian del Piombo was not destined to be long troubled with his rival; Raffaelle died but a year or so later, leaving, as is well known, his "Transfiguration" to be completed by the head of the young band who had surrounded him so brilliantly, and Sebastian del Piombo was to take the place left vacant by the death of the young Umbrian painter. The "Transfiguration" remained, as it has to this day, in Rome. As the catalogue of the National Gallery relates, Sebastian's "Raising of Lazarus" was sent to Narbonne and purchased, at the beginning of the last century, by the Regent. With his collection it passed to our shores. Mr. Angerstein was long the owner of it, and when, in 1824, the National Gallery was established, it formed one of the original pictures of the collection. In artistic circles the tradition has not yet died out how Mr. Angerstein refused for his Sebastian del Piombo a princely offer from Napoleon, made in order that this famous picture might hang opposite the "Transfiguration," where there figured temporarily so many others of the artistic marvels of Italy, Germany, and Spain, in the galleries of the Louvre.

And now this work has to pass the ordeal of being cleaned and restored,—not, doubtless, before all due consideration has been given to the important question. In support, too, of the action of the National Gallery authorities, it may not be uninteresting to quote the views

* According to M. Reiset, "Visite à la Nationale Gallery," reprinted from the *Gazette des Beaux Arts*, the proofs of this statement are to be found in a little work published in Venice in 1557, by Ludovico Dolce ("Dialogo della Pittura").

expressed on this very picture some years since by so competent an authority as the curator of the paintings and drawings of the Louvre,—M. Reiset. The picture, he remarks of the "Raising of Lazarus," has suffered at various times, and the state in which we last found it is far from being satisfactory. The colouring has taken an aspect uniform and without transparency. But it does not seem that the ill is irreparable. A prudent and skilful hand would easily remove much of the damage due to the want of skill of those who have had control over it.

OF ARCHITECTURE, SCULPTURE, AND PAINTING, IN UNITY.*

PAINTING and sculpture, in the sense of the poets, were accounted twins; and Evelyn joining with them architecture, declares those three illustrious and magnificent arts so dependent upon each other, that they can no more be separated than the Graces themselves, who are always represented to us holding hand-in-hand, and mutually regarding one another; we may reasonably conjecture that they were born together.

By a careful and unbiassed study of former ages, the press enables us to survey the several phases through which art has passed. We are in a better position, at the present time, to arrive at a just appreciation of the mental work of our ancestors, than was the case when the means of acquiring and transmitting learning were tedious and difficult of accomplishment.

In treating of architecture, sculpture, and painting, they should be studied individually as well as collectively, so as to form, when in unity, one harmonious whole. To accomplish this, the labours of the past must be respected, and improved upon. There are certain principles derived from natural laws and reason not to be overlooked, which pervade all architecture, sculpture, and painting, irrespective of styles or tastes, and are ever to be found in all works of genius and education,—

> "For beauty born within the mind
> Admits no mean decay;
> The earth may shrink, the sun grow blind,
> Ere that dissolve away!"

That the architect should be an artist is of grave importance, as it tends to raise him from a mechanical or material status. With this view a comprehensive and artistic field is presented, of great interest both to the architect and the public.

The preparation of geometrical drawings, plans, elevations, sections, &c., is a necessary constructive and mechanical process; in like manner with the sculptor who first forms a model in clay, entirely the work of his own hands, and before he begins, the statue is perfectly imagined, and the figure in visionary form is complete before him. The painter, also, prepares the ground-work of a picture, and roughly puts in the lights and shades, real and imaginary. Something more, however, is wanted, and essentially necessary, viz.,—to import *life* or soul into the compositions. Before the architect, sculptor, or painter can be ranked as an artist, he must combine, not merely the mechanical or material details, but the elements of his art must be combined into a comprehensive whole. The painter has signally failed in truthfulness, in his otherwise beautiful productions, by a gross ignorance of architecture; the sculptor likewise. The architect, then, to become an artist, must not limit his attention simply to geometrical drawings and details which are never seen in perspective, but direct his mind to the perfect whole, combining the surroundings, sky, trees, mountains, shady vales, flowery plains, green meadows, brooks, rivers, and seas,—Nature's panorama,—in which his buildings form a part. An architect, in harmonising his building with a landscape, must not imitate the painter who is satisfied with the figure, and neglects the drapery.

The architect, as an artist, should also not rest contented with his building and landscape without introducing life:—

> "Suffice it not to paint the scenes you view,
> As well as paint them you must int'rest too,
> Oft be spectators in your pictures seen,
> And frequent actors tread your sylvan scene;
> Let man see man in every line you trace,
> The world's chief honour is the human race."
> ABBÉ DELILLE.

It follows, therefore, that intellectual art and technical correctness are far from identical; that one is sometimes proved by the disdain of the other. And, as this makes the distinction between mechanical and intellectual art, so is the distinction remarkable in proportion as that intellectual art is exercised in the highest degree, in proportion as it realises the ideal; for the ideal consists not in the imitation, but the exaltation of nature; and we must accordingly inquire, not how far it resembles what we have seen, so much as how far it embodies what we can imagine.

It has been urged that "it is hardly necessary to observe that an architectural drawing requires to be viewed as closely as an engraving, so that all its detail may be clearly understood; and if it will not bear, or does not merit such attentive examination, it will hardly be worth much." This is a grave error, as in an artistic point of view, it would be absurd to give detail. There are some buildings which are calculated only for a distant view; for though, when beheld afar off, they may please, yet no sooner do we approach them, than we discover them to be greatly inferior to what they first promised to be. The spell is broken, nor is it to be renewed; because, when we again look at them from a favourable distance, we are aware of the illusion. There is no further any room for imagining beauties in store for us on a nearer examination, which we already know do not exist.

The painter leaves more to the imagination than the sculptor. The retention in the mind of the ignorant details of a well-proportioned building, applies also to a female figure with squinting eyes and flattened nose, after having seen the Venus de Medici, or other perfect figure.

Because detail is not to be discerned in the pictorial representation of a building, it affords no argument in favour of carelessness in the formation of mouldings. Beauty of detail is to architecture what *finish* is to painting, what the elegancies of style are to literary composition, what the graces of expression are to poetry. Mere beauty of language and imagery, however exquisite in itself, will not indeed atone for the absence of higher qualities, yet it will serve to render them still more attractive and impressive. So likewise in architecture, beauty of detail is indispensable to general beauty of composition.

Unity of mind and unity of action and direction can alone produce concord either in music or in architecture. This perfection is to be met with in the fine arts of the ancients. As the arts were then united amongst themselves, so one was scarcely ever followed to the exclusion of the others.

A neglect of this unity is a violation of those laws which have been instituted and established by the joint authority of architects, sculptors, and painters. No other unity is intended, and therefore none is to be sought. A fourth sister has been suggested, namely, Decoration; but she would evidently destroy the unity, as decoration belongs to the painter.

We are indebted to the sculptor for eloquence in stone, who reared his marble triumphs o'er decay, by creating the live statue and the polished dome,—

> "E'en thus of old the Cythian sculptor view'd
> The star-like form which bless'd his solitude;
> From earth and earthly beauty he had flown,
> And graved a dream of loveliness on stone."

Sculpture is acknowledged to be one of the most difficult of the fine arts. It is remarkable that it was the favourite art of Greece, and that her sculptors were more numerous than her painters. The Grecian sculptors had no other advantage over its painters than that they used more durable materials; blessed with equal genius, formed by the same education, their hearts went hand in hand to perfection. Rome imitated, but never equalled, Greece in sculpture. Whilst taste survives the famous works of Greece can never die.

The painter, although to a great extent an imitator, has, in addition to a natural genius, if he have any, much to learn, and is at liberty, like the poet and the novelist, to borrow all natural or probable effects,—from a passing cloud to a glimpse of light, real or reflected. Painting, like all other mental arts, was progressive,—

> "By slow degrees the God-like art advanced,
> As man grew polish'd, picture was enhanced."—
> *Dryden.*

Architecture itself can never reach anything like perfection, without the aid and assistance of sculpture and painting; consequently, where these are not, there cannot be the greatest architectural display.

Of the necessity of union among the professors of the fine arts, it has been urged that "the painter, the sculptor, or the architect errs when he imagines that it is in his studio only he can be useful. Far otherwise is the fact; for the varied discoveries of each should be brought, as it were, into one focus, that all may be fairly examined, and beneficially discussed. Shall he whose fine imagination presents before him the lightning's flash, as it glances from the mountain top, and whose ear listens, mentally, to the thunders as they roll through the valleys beneath; shall the man whose chisel can express from the shapeless marble an image which wants nothing but Promethean fire to make it a perfect being; or he whose chastened art can design the gorgeous temples of Greece and Italy, or frame the long-drawn aisle and fretted vault, be content to wrap such splendid talents, comparatively, up in a napkin? Certainly not; neither man nor any of his attributes were ever intended to be completely isolated."

A genius for sculpture or painting includes an eye for form or colour, or both; but it requires intellectual or imaginative powers to rise above mediocrity or mechanical excellence in the highest range of art. Of all the arts, painting, the eloquence of colours, is the most natural both in its means and effects. It is the most direct and immediate address to the senses.

Of all the objects of painting, angels call most for ideal beauty; those of Raffaelle are by no means distinguished in this particular; for he had no examples for them in nature, but was obliged to draw them from his own imagination.

The architect, after having taken a comprehensive view of buildings artistically disposed in combination with natural scenery, in every part of the world, has to direct his skill to edifices in cities, towns, villages, and situations more or less closely grouped. It is absurd to create streets with rows of houses, composed of horizontal lines, copings continuous, openings without mouldings or ornamentation; or a lengthened series of gables and gablets arranged monotonously like a crocodile's teeth. By avoiding straight lines in the formation of a street, the buildings can be disposed, as in the High-street, Oxford, and presented to the eye separately, but not as a whole. The present system of separately designing each house in a different style of architecture, enabling the architect to exhibit his own taste, produces an inartistic and discordant effect.

Architecture, although one of the fine arts, still hardly obtains any notice, and is seldom recognised by critics in general. Both the public, and those who affect to direct the public taste, seem to consider the pretensions of architecture as rather of a negative kind, compared with those of sculpture and painting. At the Royal Academy, as is well known, it has for years been looked upon too much in the light of a "poor relation," admitted out of mere charity.

Upon reflection, the architect is at fault, and not the Academy. The Academy cultivates architecture as a fine art, and not in reference to mere building; consequently, as before stated, the architect must be an artist, otherwise her sisters,—sculpture and painting,—will remind her of her original signification, "chief builder."

In the absence of sculpture and painting, no building, however well designed, can be rendered intelligent or of historical value without invoking the nine goddesses known as the Muses:—(1) Clio, presiding over history; (2) Melpomene, over tragedy; (3) Thalia, comedy; (4) Euterpe, music; (5) Terpsichore over dancing; (6) Erato, comic poetry; (7) Calliope over eloquence; (8) Urania over astronomy; and (9) Polyhymnia over singing, rhetoric, and harmony. They were called from the places where they were worshipped; their parents being heaven and earth. The Muses may be viewed in the light of train-bearers to the three sisters, Architecture, Sculpture, and Painting.

Without a generous encouragement, the fine arts can no more flourish, or even exist, than a perfect flower-garden. Ovid alludes to the utility and pleasure we receive from encouraging the polite arts:—

> "Each pleasing art lends softness to the mind,
> And with our studies are our lives refined."

The patronage of enlightened individuals and distinguished societies, such as the Society of Dilettanti, has in past years rendered great service. The countenance of the Government, and some assistance from the public purse, are also essential towards promoting the advancement of the arts and sciences, and thereby ob-

* By W. Pettit Griffith, F.S.A.

taining the approbation of all cultivated minds. The liberal, like the mechanical arts, depend wholly on the encouragement they meet with.

It has been urged that there is always a vast floating capital of invention and intellect, which only requires to be directed into the proper channels, to multiply a hundred-fold.

Closely connected as the fine arts are, their natural alliance does not always act amicably. The painters consider themselves and their works the chief, and architecture as subordinate. It should be recollected that the painters belong to the architects, and not the architects to the painters. It is true that the architects have learnt nothing from the painters, beyond the art of making bad designs into showy pictures.

They,—

"Neglect the sense, but love the painted scene."—*Creech.*

Forgetting that,—

"Good sense and nature always speak the same."—*Juv.*

Nevertheless,—

"The practis'd painter may, with skilful art,
Bid striking objects from the background start:
Wouldst thou for nature all thy efforts use,
Let not a random view these objects choose."

The profession of an architect is beset with many difficulties, of which the sister professions (sculpture and painting) are ignorant. The architect alone is subject to that ordeal,—the obligation of showing his work during its progress; his designs are, besides, frequently marred to suit the purposes of economy, or the contingencies of locality.

The union of the three sisters,—architecture, sculpture, and painting,—having the same dispositions, sentiments, and aims, and that oneness whereby, being united to the same end, cannot fail in realising a perfect building. In this case the sculptor and painter must be guided by the architect in proportioning and designing all pediments, niches, pedestals, and other features, so as to avoid incongruities. Many beautiful statues and decorations have been marred by clumsy, ill-proportioned, pedestals, and unmeaning surroundings. Perfect harmony cannot be secured without the sisters acting in concert.

To combine the three perfectly, so as to produce a beautiful edifice, requires genius:—

"The seeds of taste in numerous breasts are sown,
But few can mighty Genius call their own."

True genius springs up we know not from what quarter, what station, what parentage; it is heaven's lightning, which shines from the east to the west, yet no one knoweth whence it cometh or whither it goeth:—

"For genius, when unpractised in scientific rules,
If nursed by nature, disdains the critic's schools."

"Taste is confined to rules, it moves in chains;
Genius those fetters and those rules distains."

Architecture is the force of genius discovered. In the proportions of a noble edifice you behold the image of a creative mind. The uniformity and unparalleled simplicity of the Classical and Mediæval styles are not the result of mere mechanical skill, but of a bold and aspiring imagination. The vaulted roof, and the lofty column which seem to rest upon the horizon, and to repose in air, speak the elevation of the constructor's mind. The civilisation and refinement of nations are strongly marked by the plan and order of their buildings.

It is related of Michelangelo that he employed himself when a child in drawing with a coal rude outlines of figures. His parents, who were noble, endeavoured to repress his darling propensity, not only by reprimands, but by stripes. The force of genius, however, prevailed over the severity of his parents, and Angelo attained the highest eminence in architecture, sculpture, and painting.

Architecture, sculpture, and painting can be improved by the assemblage of various scattered perfections, and graced by emanations from the kindred arts; what excellence might we not reasonably expect to see them brought to, if the excrescences and inelegancies of ruder times were lopped off by the hand of taste? Are we to select and store up the refuse cuttings and dead flowers deposited in the rear of the garden, in preference to the beautiful flowers and vegetation cultivated in the garden itself.

Finally, architecture, sculpture, and painting ought to be combined in forming a perfect, and consequently, harmonious whole, like the universe; mere architecture is as insipid and useless as the moon without the sun, and, although some of the planets and stars have an atmosphere and light of their own, as also sculpture and painting, still it requires and demands their unity to produce one perfect and immortal entirety. The three sisters, then,—Architecture, Sculpture, and Painting,—interesting and beautiful as they are individually, require to be united into one fellowship with the same dispositions, aims, graces, and mutual affection and care for one another.

THE CITY CHURCHES AND CHAPELS: THEIR ACCOMMODATION AND THEIR ATTENDANTS.

THE *St. James's Gazette* has supplied an instalment of an important class of information which ought, in the opinion of impartial and disinterested public writers, to have been included in the returns of the census. As to the motives of the opposition so violently made to furnishing the statist with *data* of a singularly useful kind, we have not now to speak. The *St. James's Gazette* has set an example of what may be done without waiting for the result of a party vote in the House of Commons; and it is to be hoped that the example will be followed, not only through the metropolis, but in all our great towns. We refer to the census of congregations of all the City (London) churches and chapels, taken on the morning of Sunday, the 1st of May, 1881, and published June 13.

In this return, not only are the several churches and chapels for the first time published in alphabetical order, as a basis for comparison, but the capacity of each edifice, taken, it would seem, from the ordnance map; the population of the parish, for the year 1871 (which will have to be corrected from this year's census); the income of the clergy; and the number of worshippers present at each service; are set down in tabular form. There is also given (a matter which does not so directly interest us) an analysis of all the congregations (with the exception of those of St. Paul's Cathedral, the Temple Church, and the Synagogues), showing the respective numbers of paid officials and their families, of choristers, of poor attending for dole, of children in the schools, and of men, women, and children composing the remainder of the congregations. The valuable use which may be made of the latter data will account for the opposition of certain parties to the census. Our present affair, however, is rather with population, accommodation, and attendants.

The number of churches of all kinds belonging to the national Church in the City of London is sixty-three, or one to every ten acres of area. There are also a French Protestant Church, a Dutch Reformed Church, fourteen Methodist and Dissenting chapels, and seven synagogues. The accommodation given comprises 36,655 sittings for the national churches, 340 sittings for the two foreign churches, 2,980 sittings for the synagogues, and 13,944 sittings for the Methodists and Dissenters together. As to the actual congregations, there are, of course, none in the synagogues on Sunday. The national churches contained 9,336 worshippers, the foreign churches 143, and the Methodist and Dissenting chapels 4,256. There are thus provided for the inhabitants of the City of London 53,925 sittings in places of worship, which are in excess of the actual number of residents, which in the late Census (vol. xl, p. 719) was ascertained to be 51,306. The distribution of accommodation is, in round numbers, 68 per cent. for the national churches, 26 per cent. for Methodist and Dissenting chapels, 5½ per cent for synagogues, and ½ per cent. for foreign churches. The enumerated attendants were 13,735; of whom 1,766, or nearly 13 per cent., were persons in some way paid for attendance. It is a remarkable fact that the actual attendants bear a close proportion to the actual accommodation, being 68 per cent. for the national churches. But the children attending the latter were 1,374, against 355 for all the other places of worship (excepting the synagogues). This tells us something of the future; and is further instructive as showing the true causes of the opposition made to collecting full statistical returns as to the number, the accommodation, and the attendance on all the places of worship throughout the kingdom.

A correspondent writes to remark that the evening congregation at St. Paul's Cathedral is usually double, or more than double, that of the morning; and that at most of the City churches, where there is an attractive service and good preaching, the same rule obtains. We do not suppose that there is much Sunday immigration into the City. As to the resident or night-population there, the figures we have cited are enough to show that 27 per cent. of them attend the morning services. To double this for the evening would require that more than every other person in the City would attend evening worship; and if that be anything like the case, London may well claim to be one of the most church-going cities in the world.

The question raised as to "the maintenance or destruction of the churches as works of art and landmarks of history," is one on which much may be said. The destruction of a church is, under any circumstances, a fact involving very many questions, as to which not only very widely different opinions prevail among different classes of people, but as to which the conservative view is held not only by the architect, the artist, or the archæologist. With many, and probably with all those who are at once most earnest and most reverent, the reasons for the maintenance of a consecrated building are very much stronger than any above hinted at. As to that, however, we are now silent. It is enough to point out the valuable work which has been done for the City by our contemporary, and to express the desire that the unnecessary and mischievous mist in which statistics of this kind have been purposely involved by those who dread that the truth should become known, may be soon and honestly cleared away.

We may add that the capacity of St. Paul's Cathedral, which was attended by 1,950 worshippers on the morning of the 1st of May, is stated as low as 3,600. On the occasion of the funeral of the Duke of Wellington it was estimated that there were 15,000 persons in the cathedral, to each of whom the full, deep, slow, and sonorous voice of Dean Milman was distinctly audible. The smallest capacity of a City church is for 150 worshippers, which is the accommodation in All Hallows, London-wall, and also in that of St. Bartholomew-the-Less. The average capacity (excepting the cathedral) is a little over 500. Of the other places of worship, the largest is the Quakers' meeting-house, which would accommodate 3,000, and actually held 49! The average accommodation of the chapels is 850; the average attendance, 276. The smallest congregation enumerated was that of the 22 attendants at the Welsh Baptist Chapel.

KING'S COLLEGE, LONDON.

THERE are many members of the profession who will have watched with more than usual interest the ceremony with which, within the last few days, the half-century's existence of King's College has been commemorated. Not alone in London, and throughout England, but scattered in many parts of the world, there are old members of the college who will have recalled to them the school-days they passed at "King's" under the scholastic and, perhaps, severe shadow of Somerset House, which they will have learnt since those times to look on with respect as one of the noblest features of the metropolis. They recall, after many a year, the unpretentious gateway which opens from the roar and bustle of the Strand to the quiet steps leading down to the school and play-ground,—yard, perhaps, it ought to be called,—and those other more majestic steps, *terra incognita* to the schoolboys, of the college itself, as well as the stately staircase leading to the chapel, a work of the late Sir Gilbert Scott, and with which has so long been connected the name of Canon Barry.

On Saturday last the college jubilee was brilliantly closed by a *conversazione* in the old building,—a gathering which many who were unable to attend the solemn service which had been held a few days previously in Westminster Abbey, and who were prevented from being present at the meeting at Willis's Rooms, succeeded in attending to renew old friendships and recall old times.

But apart from the interest which the memories of *alma mater* ever rouse, whether it be on the banks of the Cam or the Isis, at Bonn, at Heidelberg, or Göttingen, King's College should possess for many of our readers another interest, for with its new buildings is largely connected the name of Mr. C. J. Freake, the record of whose benefactions to King's College will be handed down with respect to future generations as an example to those who generously understand the fecund value of wise benevolence.

At the *conversazione* of Saturday last, as might be expected, Mr. Freake was not one of the least honoured guests invited by "the Council and the Academical Staff" to the entertainment

they had provided. It was only fitting that the building which had echoed to the first lectures of Professor Wheatstone on the great discoveries with which his name will ever be connected should be illuminated by all the brilliancy of the modern electric light, and in the laboratory, which bears Wheatstone's name, and where could be seen many of his old instruments side by side with the most modern in invention, many to be contributed by the College to the approaching Paris exhibition of electricity, there were not a few present who were able to recall the eminent professor at the very time his first discoveries so startled the world of science, now fifty years ago.

We cannot attempt to enumerate all the attractions that were afforded, but it would be ungrateful not to speak of such splendid contributions as the pictures of Mr. J. S. Forbes, of "Chatham and Dover" just celebrity, of the works contributed by the President of the Royal Academy, of Mr. Millais's "Little Mrs. Gamp," of the splendid antiquarian objects of luxury, quite a museum, lent by Mr. Davis and the Rev. S. M. Mayhew, or of the thoroughly well-wrought metal-work contributed by Messrs. Hart & Co.

One novel feature was the tasteful arrangement on each side of the Great Hall of a drawing-room fitted up most successfully for the occasion by Messrs. Jackson & Graham. Upstairs, where the Gallery and School of Art were largely visited, several of the well-known London decorators had vied with each other in the adornment of the at other times sadly grim old rooms of the College.

When we add that under the direction of Professor Monk a charming concert was given, and that at intervals the excellent band of the Royal Artillery played in the entrance-hall, brilliantly lighted by electric light, and gay with flowers and pretty dresses, we think it will be agreed that the *conversazione* of Saturday last will long have a warm recollection among all present, be they or be they not *alumni* of King's College.

MEMBERS OF PARLIAMENT ON ARTISTIC TOPICS.

FROM time to time the members of our governing assembly take the opportunity afforded by some occasion of public speaking, such as a dinner or a delivery of prizes, to expound their feelings and convictions in regard to art. We are always interested in noticing what views are brought forward on such occasions, as a kind of indication of the set of general opinion on matters connected with art. We have had three such deliverances from members of Parliament during the past week, one from Sir Sydney Waterlow, at the Artisans' Institute on Monday, one from Mr. Samuel Morley on the same occasion, and one from Mr. Mundella, at the Artists' Benevolent Fund dinner on Saturday last. Reports are given on other pages.

Sir Sydney Waterlow, speaking on an occasion which had special reference to practical education for artisans, was appropriately practical in his tone. The point of Sir Sydney's address lay in the remark which he made as to the increased necessity in the present day for special schools of instruction for artisans, owing to the change in the division of labour in many crafts at the present day. Fifty years ago, he observed, the apprentice was brought up under the roof of his master, who took every interest in teaching him the details of the trade he was learning. In the present day shops were much larger, and work was necessarily more divided into branches, so that an apprentice ran the chance or probability, under ordinary circumstances, of only learning the one special branch of the shop work on which he was engaged. It was as a remedy for this almost unavoidable division of labour that such institutions as the Artisans' Institute were so particularly valuable, by filling up a gap, and imparting that knowledge which could hardly be obtained in the workshops. As a logical sequence to this, the speaker, who was chairman on the occasion, undertook to use his influence with the City Guilds Institute in favour of the promotion of a local technical school in the district, adding that such schools were needed in every large town in the kingdom.

Mr. Morley adduced one very cogent instance of the commercial value of a knowledge of design, in the case of two artisans of Nottingham, who had earned a guinea a week previously to their course of instruction in the science and art classes at Nottingham, and were now able to earn a guinea a day. They were designers of lace patterns,—that is to say, we presume, that their acquired knowledge and taste had enabled them to take up that occupation, and instead of having to send to Paris for "patterns," Paris now sent to Nottingham for designs. This seems a little *couleur de rose*; at least, the power to turn such instruction to such very good account must be a little exceptional, and it would hardly be justifiable to encourage artisans generally to expect such very good return for their devotion to culture. Independently of the variations in personal ability, the market for such acquirements must have its limits, though these may no doubt prove tolerably elastic under certain circumstances.

Mr. Mundella's remarks at the Artists' Benevolent dinner were more directly devoted, as might be expected, to the purely æsthetic side of art-culture. Mr. Mundella exhibits a somewhat roseate view of things also: it is, perhaps, expected of a speaker on such an occasion that he should do so. He is persuaded that we are in a very good way now as regards art and artistic cultivation. He recalls with compunction the 1851 Exhibition, and declares that we could have collected a chamber of horrors out of that Exhibition which would have left the celebrated one in Baker-street quite in the rear. This is not quite a safe line to take. To be a *laudator temporis acti* is a weakness, no doubt, but the reverse attitude is a weakness also. Doubtless we have learned and advanced a great deal since that time, but possibly the 1851 Exhibition was in itself largely instrumental in starting the movement in advance; and possibly, also, our successors thirty years hence may find that some of what we call the good taste of the present day will then appear in a different light, and it may be seen then that a good deal of our taste at present is to a considerable extent the result of fashions which are not based on any very discriminating ideas about good and bad taste in art and decoration. Mr. Mundella put in a word for the "æsthetes," and said he, at least, preferred that a man should worship a blue pot rather than a pint pot; and so far we are with him. But he was much too sweeping when he affirmed that the English school of art in the present day was superior to any other modern school in existence, and that the English school of landscape-painting was the only real one. Now we question if it can be said that an English school of landscape-painting exists at present. Some very fine landscape-painters exist, but that portion of English landscape-painting which has anything of the consentaneous character and aim which constitute a "school" does not include the most powerful and original of our present landscape-painters, each of whom is, in fact, his own "school" to a great extent. The great modern "school" of landscape-painting has been the French, though we fear we must now come very near to speaking of it in the past tense. We had, however, a certain claim to a share in its merits, since it was in fact an amplification of the art of our great painter, Constable. But it was, while the art of Corot, Rousseau, Dapré, and others was at its best, a "school" predominated by a distinct intellectual motive, in a sense in which we certainly cannot be said to have a school in England at present.

Mr. Mundella looks at art very much from a "moral influence" point of view. He congratulates the country that art is no longer a possession of priests and nobles, but of the people generally. That is quite a political and social reformer's view of the topic, and has its own truth. But it must not be forgotten that when art was the possession of priests and nobles, the former especially, it was employed upon greater subjects, and was the work of greater intellects, than it has generally been since. An art which comes home to the people generally has an immense and most beneficent effect in adding interest to their lives; but it can hardly, in the nature of things, be the greatest or most intellectual art. That appeals to the few rather than to the many, although the many catch some reflected idea of its greatness. The art which Titian produced for princes, and which Raffaelle produced for the Church, has certainly not been equalled by anything which in later days has been produced for the people at large. That there should be art for the home and the people is, of course, to be desired; but the highest achievements of art are not likely to be reached in that mission, and Mr. Mundella may not have reflected that it is to the want of such a great stimulus to the highest efforts of art as the Church and corporations once supplied, that many persons qualified to think and speak on the subject attribute the want of grandeur and of high aims in so much of the art of the present day. The analogous influence in modern times will not be supplied by the wish for art for our homes so much as by the desire of great civic bodies to furnish subjects and opportunities on a great scale to artists. For the provision of such opportunities we have long called, and we shall look for the assistance of Mr. Mundella when fresh efforts in this direction are made.

DUST.

WE are not much in the habit in London of regarding with much sensitiveness the opinion of the ordinarily intelligent foreigner, and it is difficult to say whether the ill-considered criticisms that are freely indulged in by literary gentlemen visiting our city have had very much to do in influencing the improvements that,—slowly, it is true, but surely,—are being effected. Still, without any regard to the opinion of strangers and others on many subjects, there are a few saliently offensive points that probably strike the foreigner or the stranger in London that we ourselves, from long use,—perhaps from despair, almost, are in the habit of too readily overlooking.

Too much has been said in condemnation of the absence of beauty in our London streets. Familiarity with streets and highways in other cities does not diminish,—on the contrary, adds to,—our admiration for London; but if the exterior appearance of London, which still retains so very much of its old character, has been aided so greatly,—whatever may be said by would-be critics,—by the thoughtfull skill of modern architects, there are many other points that it is only too evident are in need of careful consideration. Of these, one point most certainly must, and does, strike the stranger in London,—the utter want of cleanliness in such an enormous proportion of our great city.

People who confine their knowledge of London to the favoured districts of Belgravia or South Kensington see about them a condition of streets not by any means, it must be confessed, perfect, but sufficiently cleanly to free us from that feeling of absolute disgust that it is impossible not to experience in many other portions of this huge metropolis. Our own homes, notwithstanding their too often very deficient sanitary arrangements, are kept so carefully by our well-trained maids, who have acquired a dexterity in scrubbing, in sweeping, in dusting, and in some cases in injuring our surroundings, that amounts to almost the exactitude of the most skilfully-contrived machinery; we find at home, as so many of us do, a household state of existence, carried, it is true by great expense, almost to perfection, that we are apt to be indifferent to outdoor annoyances that, at first sight, rarely interfere with our own enjoyments.

To all, however, but the most indifferent and unobservant, it is impossible for a great share of the sense of outdoor or city enjoyment not to be seriously interfered with by the unsightly appearance of our roadways; the accumulated filth, the shreds of paper and unsightly odds and ends that are so imperfectly removed. Difficult and expensive as is the management of the many hygienic necessities of a great city, the cleanliness of the thoroughfares is a matter which cannot be placed in the rank with such apparently Utopian conceptions as perfect systems of drainage and water-supply. To all who know Paris, the possibility of the London streets being kept decently brushed, the dust and stray paper,—this latter a particularly offensive feature,—removed, the roads and pavements scraped, is no Utopian dream: it is a simple matter of appointing an adequate number of skilled hands to do the work, instead of the too few and,—which is the chief point,—utterly incapable and undrilled sweepers and scrapers at present employed.

As little by little the work was done, it would be found to become more and more easy. It must have constantly astonished visitors to the French capital to observe how large an amount of roadway can be attended to by a single active sweeper,—very often a woman,—whose *daily* duty this becomes. Whether the absence from Paris of the unsightly scraps of paper that

defile our London thoroughfares and unoccupied spaces, be owing to the industry of the *chiffonier*, who, with his hooked stick and little lamp, scours mysteriously the streets immediately after nightfall, hurrying every scrap of paper into the huge picturesque basket he bears on his back, we know not, but the fact remains that paper-strewn streets and parks are unknown on the other side of the Channel. The Paris authorities have, it is true, adopted an excellent scheme of allowing a flow of water to run down each side of the street, and into which is brushed all the less offensive dirt which is washed down, the drains being thus continually flushed. Such an expenditure of water our London supply could not, of course, bear; but a supply of proper sweepers and inspectors to see that the work is sufficiently often and thoroughly done is surely within the power of a wealthy community like ours, in which there are, however, so many unemployed hands, though it is, perhaps, to the use of such incapable and indifferent helps that in most cases is due the careless manner in which our streets are at present cleansed.

From a hygienic point of view, if not, at least, from that of exterior appearances, the want of cleanliness in our streets, which in wet, windy, or dry weather is intolerable, cries for attention, and the brilliant illumination of our streets at night only serves in the more crowded thoroughfares to show an atmosphere thickly befogged with dust which the constant traffic is continually stirring from the road and pavement, where it lies unremoved for every current to whirl about. If we knew how much our indoor surroundings suffer by the accumulation of dirt in our streets, if we would only calculate, as great scavengers are called upon to do, the enormous amount of refuse, and how to deal with it, that is allowed to accumulate in our streets, we should begin to see our way to the possibility of avoiding with greater ease in our houses that portion of the scavengers' property that reaches us through our open windows, our imperfectly constructed doorways, and by that insidious process by which dust penetrates through a thousand chinks and crannies.

We all well know what London streets are like in wet and dull weather, or when the March winds fill the atmosphere with something worse than the November fog,—worse, because the fog brings with it merely a series of throat complaints that medical science, in some degree, can deal with; but who or what medical skill, however learned, can venture to classify and detect the numerous complaints, the fearful maladies, that may exist in an atmosphere befouled by the decomposition of a great city like London?

THE NEW BUILDINGS IN THROGMORTON AVENUE.

No part of the City has been more modernised within the last few years by the erection of handsome new buildings for commercial purposes than the locality stretching between London-wall and Throgmorton-street. The freehold of the greater part of the area in this neighbourhood belongs to the Carpenters' and the Drapers' Companies, and the first-named company having some time ago completed and opened their new hall at the corner of London-wall and Throgmorton-avenue, have in succession leased the adjoining land belonging to them on both sides of the avenue, on which several buildings of a costly character, for commercial purposes, have been erected, including the handsome block of offices for the Submarine Telegraph Company (illustrated in the *Builder* in November last), a fine building for the Imperial Bank of Ireland, another building adjoining, of very large dimensions, now in course of erection for Messrs. Gooch & Cousens, together with several other blocks for general office purposes. The only remaining site in that part of the avenue belonging to the Carpenters' Company has just been leased. It consists of the exact site upon which the old Carpenters' Hall formerly stood, and immediately adjoins the Submarine Telegraph Company's offices. A new building is now in course of erection upon the site, from the designs of Mr. Chancellor, architect, and we learn that it is to be similar in its architectural features to the Telegraph Company's buildings adjoining it. The Drapers' Company have likewise leased nearly the whole of their land adjoining, in the direction of Throgmorton-street, upon which similar large blocks of mercantile buildings have been erected.

INDUSTRY AND WAGES IN FRANCE.

LA *Statistique* for 1877, recently published, gives a comparison of wages between 1853 and 1877, which is of considerable interest at the present time, even though the figures are not quite so up to date as might be. French statistics (and especially official statistics) are notoriously late in production, and this one is no exception to the rule. For all this, the tables in this particular case are worth studying, as showing the uniform rise in wages of all classes in the twenty-four years. The list is somewhat long to reproduce as found in the report, and it will therefore be better to select those occupations which have a more direct connexion with building.

Trade.	Daily Wages. 1853.	1874.	Increase	Per cent.
	Fr. c.	Fr. c.	Fr. c.	
Brick and Tile Makers	1 84	2 83	0 92	49
Quarrymen	2 02	3 03	1 04	51
Carpenters	2 20	3 74	1 54	71
Wheelwrights	2 06	3 23	1 17	57

It will thus be seen that the trades in general have partaken of a rise averaging for men 52 per cent., and it is the same, though not quite so much, in the case of women. Industries are divided the French into two categories, the great and by small, the former answering to our staple trades, the others to the numerous occupations radiating from these. In the latter, the increase of wages has been in no case less than 40 per cent., while in some it is as much as 70, the average being 52. The explanation of the "grandes" and "petites" industries by statists is, that the first is applied when masses of artisans are employed upon the same thing, and when, so to speak, man is only an integral part of the machine. The "petite industrie," on the other hand, is found where individual labour is the principal element, and domestic rather than factory work is the result. At the same time, the development of machinery in both large and small trades has of late years been breaking down this line of demarcation, so that the garret-masters and small workmen are gradually being eliminated and absorbed into larger establishments. The printing-trade is a good illustration of this change. There are still in Paris and the provinces a fair number of presses doing an average jobbing business, but every year sees some of these disappear, and more ambitious machinery take their place, increasing in size and amount of production, until we arrive at such celebrated printing-works as those of Chaix, Firmin-Didot, Mame, Dupont, &c. It is within the memory of the present generation when the Paris printers made a riot at the introduction of machinery into the printing-offices, of course under the usual misapprehension that their occupation would be taken away. The letter-press printers, however, did not share in the gloomy anticipations; and at the present time, the wage of the Paris printer has enormously increased since 1853, when it was 2 fr. 40 c. per day. The ordinary rate now is 6 francs a day, and as piece-work is generally the rule, compositors can often earn 7 to 8 francs. Women are very largely employed in the departments, and can make on an average 4 to 4½ francs. The wages in the building trades cannot show such great rises as these, but there is no reason to complain on the part of the men, the average increase being about 70 per cent. in the case of carpenters, 58 in that of the masons, and 57 in those of navvies and labourers. Food industries have participated in the same way. Bakers, who earned in 1853 but 1·90 by day or night, in 1877 made 3·31, a difference of 74 per cent. Butchers have risen 64, brewers 51, the least successful being the pastrycooks, who have only had a rise of 32. In the great industries, such as textiles, the increase has been as continuous, and on a still larger scale. A sizer in a Mulhouse factory, who in 1853 earned 1·50 a day, now gets 3·50, a rise of 170 per cent.; a spinner then made 1·75, and worked the way up to 4·15 by the year 1865. In 1855 the mule-spinner received 2·50, and he now earns 4·25, so that, altogether, wages in this branch of the cotton trade have risen by 143 per cent. A woman-carder earned formerly 87 centimes, now she has 1·60, and a girl-spinner at Dornach earns 2·30 instead of 1 franc, an increase of 130. In weaving departments wages have risen within the last thirty years from 20 to 70 per cent. according to the branch of work, and partly to the locality; for, it must be remarked that wages in the same occupation are by no means the same throughout France. For instance, cotton operatives in Alsace gain less than those in the Vosges, and the latter less, again, than those of Normandy. An Alsace spinner will make 3·50 to 4·50, a Vosges spinner from 3·75 to 4·75, and a Norman from 4 to 5 francs. We find something of the same kind in Great Britain, as in our flax and linen trades the wages at Leeds are not so high as those at Dundee; but, generally speaking, there is a greater equalisation in English than French wages throughout the different trades, owing probably to the more intimate connexion of one trading district with another and the action of the unions. While it is gratifying to observe the improved condition of the French workman, the counterbalance of dearer living must not be forgotten. While bread and wine have maintained a tolerably equable standard of price (the latter remarkably so, considering the mischief wrought by the *phylloxera*), butter, eggs, cheese, and meat, and, above all, rent, have increased amazingly; though, after taking these things into consideration, there is no doubt but that the workmen, both in France and England, make more money, in proportion, than they used to do.

THE ARTISANS' INSTITUTE.

ON Monday evening last a meeting was held at the Artisans' Institute, Castle-street, Upper St. Martin's-lane, for the purpose of presenting prizes to the students, and of hearing the seventh annual report read, and statements made as to the future, the Institute being about to become merged in the City and Guilds of London Institute for Technical Instruction, as stated below. Sir Sydney Waterlow, bart., M.P., presided.

Mr. Hodgson Pratt, one of the trustees, read the seventh annual report, which stated that in the last annual report the trustees expressed great satisfaction at having to make the announcement that the City and Guilds of London Institute had expressed their intention of carrying on the work hitherto carried on by the Artisans' Institute in Castle-street, in the new premises now being erected by them in Cowper-street, Finsbury. During the intervening period, the City and Guilds Institute requested the trustees of the Artisans' Institute to continue the work, offering them 300*l.* towards the expenses. That emphatic mark of approval showed that competent judges had pronounced the important work of the Institute to have a recognised value. The Artisans' Institute was founded in consequence of urgent representations, made by skilled artisans and others interested in improving the technical education of workmen, as to the need of an institution where the teaching of the theoretical principles of science which underlay various handicrafts should be combined with the application of those principles to practical work. It was widely felt by the workmen who assisted in the formation of the Institute, that the technical instruction to be derived by an apprentice in the workshop was inadequate, while the ever-increasing tendency towards division of labour diminished the chances of an apprentice becoming a good all-round workman, and prevented his properly appreciating the relations of the several branches of his trade to one another. The work of the Institute had been from the first carried on by teachers who were themselves skilled workmen, and who had taken Science and Art Certificates. Some who might have helped the Institute in its early days held aloof, because it was erroneously supposed that the Institute wished to supersede the teaching of the workshop; but it was soon recognised, on the contrary, that all the Institute aimed at doing was to supplement the teaching of the workshop, and to supply admitted deficiencies in workshop training. The trustees had the satisfaction of knowing that several of the former students in the classes of the Institute had been able, in consequence of the technical instruction they had received there, to take positions to which they could never have attained but for the instruction they had acquired in the

Institute. It was only due to the teachers to say that, for a very moderate amount of remuneration, they had devoted themselves most heartily and energetically to their work. The success of the Institute was also largely owing to the labours of the Rev. Henry Solly, who was the Principal of the Institute during the first four years of its existence. In conclusion, the report gave the following particulars of the classes held at the Institute, viz.:—Solid Geometry, 21 students: teacher, Mr. Millis; Model and Perspective drawing, 19, Mr. Ramsey; Geometry (Art), 6, Mr. Harland; Modelling, 11, Mr. Wright; Mensuration and Quantities, 22, Mr. Harland; Building Construction, 15, Mr. Harland; Bricklaying, 16, Mr. Channon; Carpenters and Joiners, 24, Mr. Staynes; Masonry, 9, Mr. Wall; Metal-plate Pattern Class, 30, Mr. Millis; Metal Turning, 6, Mr. Reed. There were thus nominally 179 students enrolled in the various classes, although, as some students were attending more than one class, the actual number of students was 130.

The report having been adopted, on the motion of the Chairman, seconded by Mr. Samuel Morley, M.P., the prizes to the successful students were presented. The following are some of the awards:—

Modelling Class (for Original Designs).—First prize, A. Young; second, W. Standley.

Carpenters and Joiners' Class.—Advanced, T. Hosken. Elementary, C. Daubeny, first prize; R. Elder, second.

Masons' Class.—First prize, S. Weeks; second, A. Blytham.

Mensuration and Quantities.—Elementary stage, Owen S. Turner.

Bricklayers' Class.—Prize for progress to Mr. Leggett.

The Chairman said he had particular pleasure in attending the meeting, because he was then standing within a few hundred yards of a workshop in which he served a seven years' apprenticeship to a technical trade. He could, therefore, sympathise with the large number of young men present, most of whom, he apprehended, were still serving their time, and he could also appreciate the advantages which the Artisans' Institute afforded them by enabling them to learn something of the science and art of the trades which they followed. No such advantages existed during the time he was an apprentice, between the years 1834 and 1841. He could only hope that the advantages offered by the Institute would compensate to some extent for some of the difficulties in which apprentices and workmen were nowadays placed, as compared with the position in which they stood in olden times,—say fifty years ago, when apprentices were a part of the master's family, in London especially. They lived under his roof, they went with him to his work, they worked in the same shop with him, and he, the master and owner of the business, taught his apprentices the details of his work, and that for two reasons, —first, because he, like the majority of masters at that time, felt bound to do his best (as he had undertaken to do so by a bond which he had given to the parents of his apprentices) to teach his apprentices the "art and mystery" of the craft he followed; and secondly, because it was to the advantage of the master that the apprentice should become as expert as possible, and therefore as valuable and as useful as possible. In those days workshops were not so large as they are now, and the master or workman much more frequently than was now the case made an article throughout, from the beginning to the finish. Nowadays, owing to the employment of machinery and to the large size of the workshops, there was a much greater division of labour than there was in the days of which he had been speaking, and it frequently happened that an apprentice starting work in a large factory or workshop was attached to one particular department, and kept to it, without opportunities of learning anything about the work carried on in other departments of the factory, and he therefore failed to realise the relationship of his own part of the work to the complete whole. Now, the objects of that Institute and of the City and Guilds of London Institute were to afford to apprentices, and to workmen who had completed their apprenticeship, facilities for meeting the deficiencies of the technical education of the workshop. An apprentice or workman engaged in a very large establishment, where he was only employed on certain portions of the work turned out, was very much like a cog in a large wheel: he took his pressure and his part of the work as the wheel turned round, but unless he supplemented the work of the workshop by some such means as joining the classes of the Artisans' Institute, he failed to know or to understand the nature and object of the part of the work which he had done. While he, as treasurer of the City and Guilds of London Institute, was very glad to assent to the suggestion that that body should contribute towards the maintenance of the Artisans' Institute as long as it carried on its work in Castle-street, and that when the time came the work should be taken over by the City and Guilds Institute, he nevertheless could not help feeling some regret that the work of such an institution as the Artisans' Institute should be taken to such a distance as Finsbury, —not that he had any doubt that such an institution was wanted in Finsbury,—but what were the apprentices and workmen of the neighbourhood of St. Martin's-lane to do? He was afraid that they could not go to Finsbury, or even to the central institution in Exhibition-road; for, owing to the long distances, they would have to spend all their spare time in going to and fro. The only hope he had was that the City guilds might, out of their great wealth, furnish the City and Guilds of London Institute with sufficient means to enable the latter body to establish a local school in the neighbourhood of St. Martin's-lane, where, he ventured to think, the success of the Artisans' Institute had proved that there was a demand for technical education. He would endeavour to bring before the Council of the City and Guilds of London Institute clearly and distinctly the fact that the classes of the Artisans' Institute had been established in that locality for several years past, and had done good work, and that they could not be removed to Finsbury without great loss to the workmen of the neighbourhood, in which they had been carried on. The Exhibition of 1851 had first opened the eyes of many to the fact that English productions were in danger of being excelled by those of foreign nations. He was himself an exhibitor of some machines of a very delicate character in that Exhibition, and he remembered comparing the workmanship of those machines with that of machines exhibited by foreign countries; and although, no doubt, at that time, in matters of pure engineering, the English were at the top, yet, in matters of design and finish, it was clearly apparent even then that, unless English manufacturers and workmen looked to it, they would have very sharp work to hold their own. He hoped that we were now thoroughly alive to our weaknesses and defects, and that by means of technical classes and colleges such as had been established, not only in London, but in Leeds, Bradford, and Nottingham, we should make up for time lost,—and when Englishmen did make up their minds as to what was the right course to pursue, and put their whole energies into the work, they very rarely failed. He was quite conscious of the fact that the position of technical education in England at the present time was very far behind the position it occupied in foreign countries. No one could read the report published by the City and Guilds of London Institute as to the way in which technical education was carried out at the technical college at Chemnitz, in Saxony, without being convinced of that. We had a great deal to do to catch up to the foreigners in the way of promoting technical education, and he hoped that not only would the work in this country be aided by the pecuniary help of wealthy individuals and private bodies, but that the Government would before long see its way to do more in the matter. In foreign countries, the technical schools were supported from three sources,—partly by the fees of the scholars and private contributions; next, and to a far larger extent, by the municipal authorities of the cities and towns in which such schools were established; and thirdly, by large grants made by the State out of national funds. It was only right that the State should help in such matters. The question of technical education was not a local one, but was of national importance. Technical schools and classes were needed in every town where manufactures were carried on. In examining, just before the meeting, the work done by the students of the classes of the Artisans' Institute, he had been very much struck by the work done in connexion with the sheet-metal pattern class. At first he could scarcely have realised that such work as was done in that class was not done in the workshops of the trade, but he was informed that few workmen and very few apprentices were able to cut out their own work from the sheets of metal in order to produce an article of which they had a model or perspective drawing before them. It was a great pity that such instruction was not given in the workshops, because if the workmen possessed such knowledge they would be able to do their work more accurately and with greater economy of material than was at present the case. He was quite sure from what he had seen of the work done at the Artisans' Institute that the trustees and those responsible for its management were exceedingly grateful to the teachers of the classes for the good services they had rendered, because, in the beginning of such work, the great difficulty always was to find practical teachers. No doubt very much had been accomplished by the Artisans' Institute in the way of giving a sort of preparatory training to men who would hereafter be of value as technical teachers. He said that in the presence of Mr. Magnus, the Director of the City and Guilds Institute, and of Professor Ayrton, for he thought in schools or classes such as had been carried on by the Artisans' Institute, the City and Guilds Institute might find some persons qualified to be pushed forward to occupy the position of teachers. He was very glad to see the progress made by the masons' class. He frequently travelled on the Continent, and whenever he saw a cathedral being repaired or built he generally looked in to see the kind of workmen employed. He did not recollect a single case in which he found an English or Scotch workman employed on such buildings, but he understood it was no uncommon thing to find foreign workmen employed on the carving or some other details of English buildings. He hoped that the spread of technical education in our own country would obviate the necessity of bringing foreign workmen over to this country for such purposes.

The Rev. Henry Solly, Mr. E. C. Robins, F.S.A.; Mr. Walker (a teacher of some of the technical classes in connexion with King's College), Mr. Philip Magnus (Director of the City and Guilds of London Institute), Mr. Samuel Morley, M.P.; Professor Ayrton, and Mr. Millis, also addressed the meeting, Mr. Samuel Morley paying a high tribute to the zeal with which Mr. Hodgson Pratt had promoted the success of the Artisans' Institute and its work. Mr. Hodgson Pratt, in replying to a vote of thanks for his services, said he had done what he had because he felt that when a man had any leisure, he was responsible for using it in such a way as to do something for the benefit of his fellow-beings. He urged upon the City and Guilds of London Institute that, in whatever they contemplated doing in the future for the benefit of the working men of this country, they must take them into their counsels and respect their desires. Whatever success had attended the Artisans' Institute had been due to that course having been pursued in the first instance.

"BRAMANTE AND ST. PETER'S."

IN reviewing lately, under the above heading, the remarkable volume on the share of Bramante in the design of St. Peter's, published by the Baron de Geymüller (see *Builder* for March 5 of this year), we commented on the elevation of the dome and lantern given, on the authority of Serlio, as the design of Bramante, and expressed our doubts as to whether the lantern in this design was not a dangerously heavy erection to place on the top of a hemispherical dome. In reference to this, it may interest those of our readers who gave attention to the subject to know that there is to be had from the same publisher (M. Baudry, Librarie Polytechnique, Paris), a short treatise or "*étude*," by M. Durand-Claye, in which the question of the stability of this design is scientifically examined. The author, who is an engineer of the "Ponts et Chaussées" department, sums up in favour of the stability of the dome. We can hardly say that we have had time to go fully into the very elaborate calculations and reasoning of the author, nor would they be intelligible in any case without the aid of the diagrams. But we desire to bring the *étude*, which forms a kind of appendix to Baron de Geymüller's work, before the notice of our readers. We may say, however, that though the calculations of M. Durand-Claye may prove the theoretic possibility of the safe erection of the dome and lantern on the section shown, we should prefer to evade the practical responsibility of erecting it, and we imagine most architects would concur with us, unless the condition of very extensive tying were granted, and in that case the problem would not, of course, be the same.

WHITELEY'S NEW BUILDINGS IN QUEEN'S-ROAD, BAYSWATER.

THE very spacious block of new premises, which for some months past has been in course of erection in Queen's-road, Bayswater, for Mr. Whiteley, popularly known as the "universal provider," has just been completed and opened, forming entirely distinct and separate premises from the already large establishment in Westbourne-grove (where everything, from a wife to a box of matches, a babinette to a hearse, may be obtained). The building, which contains thirteen shops, and several floors above, has a frontage to Queen's-road of 280 ft., extending southwards from Douglas-place to the new Paddington Baths and Washhouses, and being carried to a depth of 300 ft. along the return frontage in Douglas-place, occupies a ground area of nearly two acres in extent. The Queen's-road elevation is 65 ft. in height, and is surmounted by an ornamental parapet, with terminal vases in terra-cotta. The elevation is faced with Portland stone and red Aberdeen polished granite. The ground-floor has massive Portland stone piers, surmounted by carved capitals, with figure-heads in the centre. Immediately above the shop entablature an ornamental iron cresting or balcony is carried across the frontage. There are three lofty floors above, each floor containing ranges of three-light windows. The centre of the Queen's-road frontage is surmounted by a tower, covered with zinc, with an iron cresting, rising to a height of 104 ft. above the pavement line. The return frontage in Douglas-place, to the depth of 30 ft., is exactly uniform with the Queen's-road elevation. As showing the large dimensions of the interior of the premises in which the manifold departments of the establishment are conducted,—embracing almost every imaginable trade and calling,—it may be stated that, including the basement, which, like the rest of the floors, is fully utilised for business purposes, the entire floor area of the building is little short of ten acres in extent. And here it may be added that, including those engaged in the Westbourne-grove establishment, the entire number of persons employed at Whiteley's is said to be between 3,500 and 4,000, no fewer than about 250 of whom are clerks engaged in the various departments.

Mr. Ebenezer Saunders is the architect of the building, and Mr. W. Brass the contractor, Mr. Thos. Warburton being the clerk of the works. The cost of the building is stated to have been about 160,000*l.*

In addition to these new premises, another block is now in course of erection immediately on the south side of the Paddington Baths and Washhouses. This building, which is intended for dormitories for the male portion of those in Mr. Whiteley's employment, will have a frontage to Queen's-road of upwards of 70 ft. in height, and 300 ft. in depth. It will contain five stories, with about 100 bedrooms, and dormitory accommodation for between 300 and 400 men. The Queen's-road frontage of the building is in white Suffolk brick, with Portland stone dressings.

THE MERCERS' HALL, CHEAPSIDE.

INTERNAL FITTINGS.

THE interior fittings of the important addition recently made to this building are now completed, and render it one of the most commodious as well as one of the handsomest of the halls of our City Guilds. The style of ornamentation adopted is of the period of the building of the hall,—the period of Sir Christopher Wren.

The principal entrance is from Cheapside. The walls here are of Mansfield stone, and are relieved by pilasters with cornice and frieze of the Doric order. We pass by large oak doors to a *vestibule*, where the walls are lined with wainscot panelling, about 14 ft. high, and above that are covered with leather hangings, the ceiling and cornice representing oak framing, with ornamental plaster panelling.

The *Grand Staircase* is entered from this vestibule, under a bold double archway, supported by fluted columns, all of oak. The area of the staircase on the ground-floor is about 15 ft. by 20 ft., and has a height of above 40 ft. The whole of the walls up to the first-floor landing are of panelled wainscot, relieved by bold carving in the panels and friezes. The stairs are 8 ft. wide. The stringings are richly carved with scroll ornaments, and the balusters are also carved and fluted, each flight being intercepted by moulded newels supporting carved lions carrying shields. At the south end is a carved oak screen, separating a space forming a cloak-room. On the west side, facing the entrance under the arches, is a stone chimney-piece, 11 ft. high, picturesquely carved, and in front of this, and associated with it, are two carved pillars, supporting the middle landing of the staircase. On proceeding up the stairs we pass under segmental arches, carrying a coved skylight, filled with yellow and white ornamental glass, and arrive at the first-floor landing, leading directly to the upper vestibule through another archway. The walls of the upper part of the staircase are lined with leather hanging, and the cornice and frieze are of oak, relieved with bronze and gold ornament. Above these are lunette panels, in three of which are well-executed paintings, representing the Arts, Industry, and Commerce; in the fourth lunette, on the south side, being a window, are the arms of the Company in stained glass. In the richly-framed circular ceiling, at the top, is a clever painting of Mercury, by Barrias.

Passing by the *Upper Vestibule*, where the fittings are all of oak, we enter the *Drawing-room*. This apartment is about 53 ft. long, 21 ft. wide, and 21 ft. high. It is lighted by a large centre window, with three smaller windows on each side. The whole of the fittings are in walnut-wood, elaborately carved and relieved with gilding; the ornamental panelling is carried to a height of 12 ft., and is surmounted by a cornice, in which is carved foliage copied from the stalls in St. Paul's Cathedral. In the panels are a series of beautiful arabesques painted in quiet colouring on a diapered gold ground. There are two fine doorways, the frontispiece of each being 16 ft. high; the folding-doors, 9 ft. high, are delicately carved in scroll-work, and contain carved medallion figures in low relief; in the parts above are figures and foliage in bold relief. The two chimney-breasts correspond in style and equal in size the doorways, and in the carved frames over the chimneypieces are looking-glasses. At the end of the room there is also a carved circular-headed framing, corresponding with that of the large window and similarly draped, enclosing looking-glass, which reflects the length of the room. The walls above the panelling are hung with rich Brocatelle silk, in shades of deep red on a dull ground, and are intersected at intervals by pilasters of grey Bardilla marble with Vert de Gênes panels, framed with gilt moulding and surmounted by gilt capitals. The ceiling is divided into three compartments by enriched beams, supported by trusses resting on the marble pilasters. In the centre of each compartment are paintings, of spirited and graceful composition, by Barrias; that in the centre represents Apollo with figures, symbolising the arts of Painting, Sculpture, and Architecture; and in the panels on either side are figures of Poetry and Music. In the smaller panels surrounding the centre ones are cameo figures on a dark blue ground, and richly-coloured arabesques on gold grounds. The ornamental framework is gilt, the colour of the groundwork being subdued brown. The furniture is very handsome, and made in a style suitable to the period adopted. The curtains are of silk Brocatelle, bordered with velvet embroidered in *appliqué* work in the Venetian style. The Axminster carpet has been especially designed for the room, and is rich and harmonious in colour.

From the Drawing-room we proceed by the central doorway to the Court Parlour, which has also been handsomely decorated, and thence pass through the Court-room with its dark oak panelling, relieved by gilding, to the large hall, a stately room, retaining the original dark oak panelling to a height of 20 ft., and around the cornice of this are ranged the numerous coats of arms of past-masters of the company. On the walls above are gilt leather hangings, and the six large windows, three on each side, are now filled with richly-toned stained glass, containing full-length portraits of St. Thomas-à-Becket, whose father lived on the site of this hall; King Richard II., a free brother of the Company; Sir Richard Whittington, master of the Company; Dean Colet, founder of St. Paul's School; Queen Elizabeth, a free sister; and Sir Thomas Gresham. The arms of twenty-four of the more celebrated members of this Company are also displayed in these windows, and the royal arms and those of the Company are placed in the circular windows at either end of the hall. The ceiling and cove of the hall, formerly void of ornament, are now panelled and relieved with colour and gilding.

The whole of the interior fittings, carved work, and decorations described above, and illustrated by us, were designed by Mr. J. G. Crace, and have been executed under his direct superintendence.

DESIGN FOR WOVEN FABRIC.

THIS design is suitable for either silk or woollen fabric, and repeats in 22 in. by 20 in. It was necessary to reduce it very much to show the manner of repeat, and it has by this lost considerably, as designs of this kind always look better on a large scale; indeed, it is not saying too much to aver that it would not be too large if carried out twice or even three times its original size; but as the opportunities for using it on those scales would seldom, if ever, occur, it has been drawn to the above scale to suit the requirements of the present day, and that it might be utilised as a wall-paper if desired.

Although based upon no particular style, it will best convey the idea of that of the time of Louis XIV. or XV. As to its colours, three would be plenty. If in silk self-colours could be most successfully used,—such as three yellows, greens, reds, &c.

For woven fabric it would be better in contrast, as red, gold, and black,—the hatched work being red, the white gold and, the outline and solid parts in black; and it could be used either as curtains or dressing for walls.

PROPOSED MONUMENT FOR THE "PLACE DE LA NATION," PARIS.

A COMPETITION amongst sculptors was held some time ago in Paris for the honour and profit of providing a monument to adorn the *Place de la République* in that city. Amongst the models submitted was one by M. Dalou, which was put aside as not wholly in accordance with the conditions issued. Its merits, however, were so evident, that the jury and the *Préfet* have proposed to acquire it for the city. Its destination is not yet precisely fixed, but it is understood that when completed it will be erected in the *Place de la Nation*.

Of this fine design we give a view, fully agreeing with those who have praised it. The nobility of aspect given to the various figures included, the effect of movement imparted, and the arrangement of the whole, mark it as a work of no common merit. The side view is even superior to that which we show, the front.

EXCAVATIONS AT POMPEII.

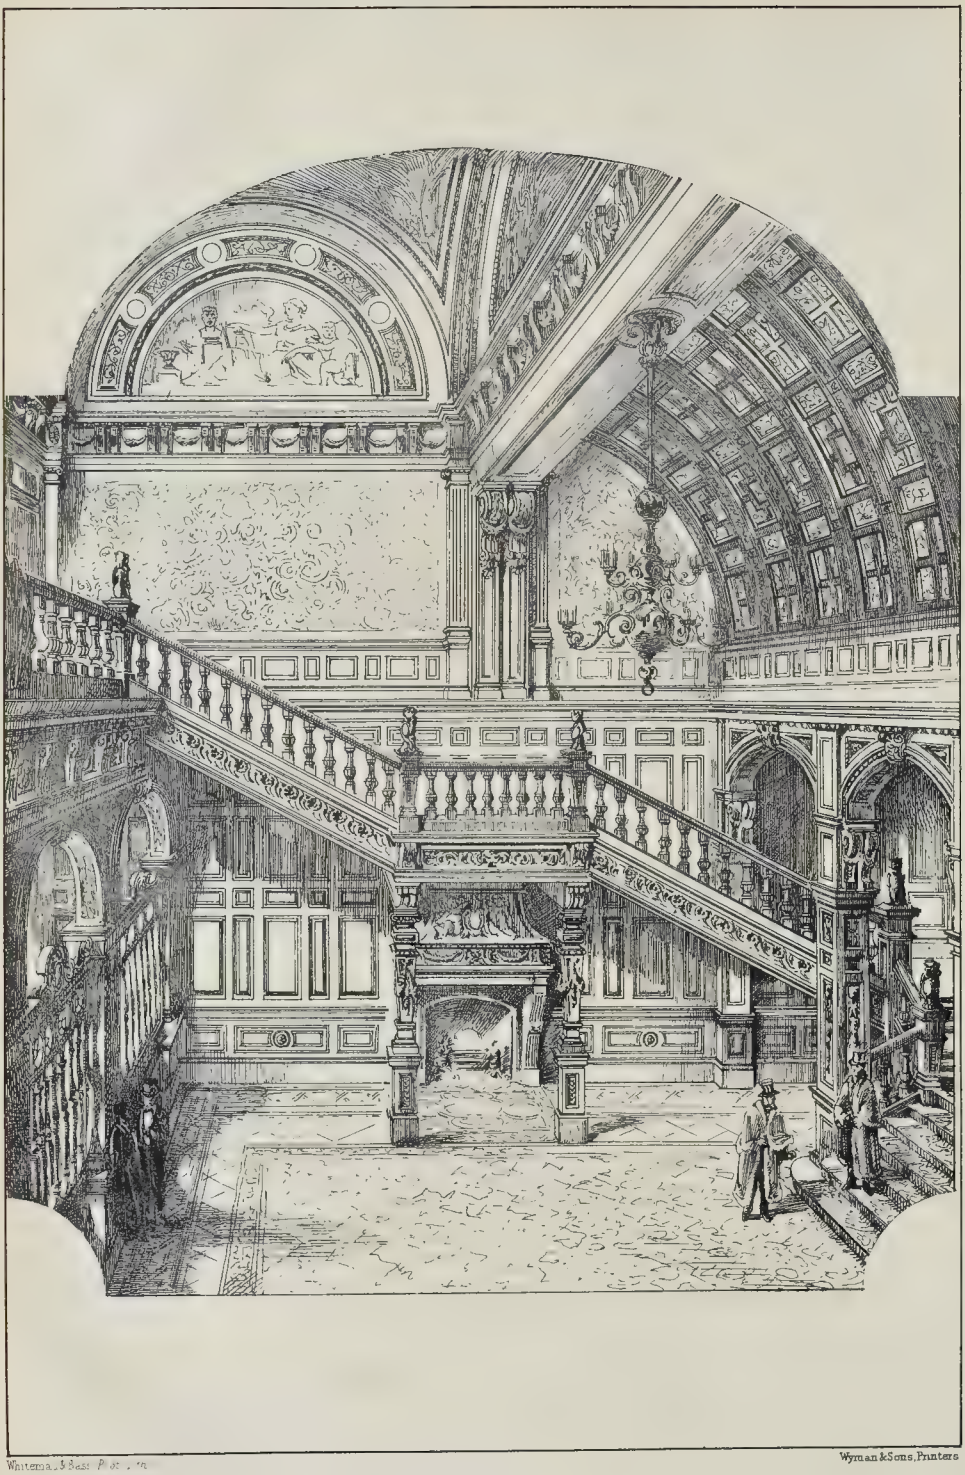
A NEW POINT IN THE HISTORY OF ARCHITECTURE.

IN a recent visit to Pompeii I observed, in the new excavations, a piece of architectural detail to which I think attention should be called, as, like many other discoveries, it refutes some preconceived theories,—in this case, as regards the date of a style in architecture.

The authorities at Pompeii have not called attention to it; and, as far as I can learn, no one has noticed it. I explained it to the guide for the benefit of future visitors.

I believe it is the received opinion amongst architects that it was not till the time of Diocletian that arches sprang direct from the columns, and that there is no example before that date.

In the excavations of this year at Pompeii, a large house has been uncovered, in the peristylium of which the arches spring direct from the capitals of the columns, which proves that this architectural detail was known long before the time of Diocletian, and evidently prior to A.D. 63. The house was partly destroyed in the earthquake of that year and had been restored, but in restoring the peristylium they carried the columns up to the base of the entablature. For some reason, in making the repairs they did not carry out the original design, but enough original work is left to show the peculiar construction of arches springing direct from capitals at a date before A.D. 63.



S. RUSSELL FORBES.

*** Mr. Russell Forbes sent us a photograph of the newly-discovered remains, from which we have had a careful engraving made. The point is one of considerable interest.

NEW STAIRCASE, MERCERS' HALL.

THE IMPERIAL KIOSK AT THE SWEET WATERS OF ASIA.

THE Sweet Waters of Asia, on the borders of the Bosphorus, is a well-known delightful spot resorted to by many visitors, and here, near the well-known fountain of white marble, has been erected the Imperial Kiosk, of which we give a view, for the Sultana Validéh, mother of Abdul Medjid. It is neither Greek, Roman, Gothic, nor Renaissance. At first sight it might be taken for an old Venetian palace, but the mistake is soon discovered. It has a certain charm of its own, and we give a view of it as an example of fantastic and ornate architecture, in the composition of which, however, classic traditions, proportions, and *finesse* have not been disregarded.

The situation and surroundings of the kiosk are of the most delightful character. In this respect the Turks always choose well.

DUBLIN.

The New Sewerage Works.—The allegations made a few months ago as to defective workmanship and construction in the new sewerage works have formed the subject of a careful inquiry by Mr. Cotton, engineering inspector of the Irish Local Government Board. Mr. Cotton, in his report to the Board, after enumerating the charges made against the work, says:—

"With regard to the quality of the materials used, I consider these complaints are without foundation. The evidence generally was strongly in favour of the good quality of the materials employed by the contractor. One witness said that mortar in some cases had been ground and coloured with some material to look like cement. I consider this a wanton and groundless charge. It was not shown that cement was to be used where this mortar was brought, and cement mortar would never be ground at a distance from the works.

As regards workmanship, several defects have been established,—mock masonry in a catchwell,—a house connecting pipe inserted at too low a level,—a very small quantity of underpinning omitted,—a junction made by breaking a hole into a pipe sewer,—temporary covers of manhole and ventilating pipe omitted to be replaced by the permanent covering rings, and an excessive use of bats in places in the arch-sheeting.

These are not serious defects; of course, they should not have occurred, nor could they if there had been clerks of works doing their duty.

The errors in levels are more serious. I believe they would not have escaped the final detailed examination. The way they have occurred is readily understood, and it is to be noted that these errors are due, in their origin, not to the present staff of engineers, but to mistakes made in the preparation of the plans, and only one such additional mistake has been found in all the sections, numbering, I believe, over 200."

The secretary to the Board, in communicating this report to the Town Clerk, says:—

"The Board are glad to find that since the complaints have been made, the staff employed in the supervision of the work has been strengthened by the appointment of two clerks of works, and the Board think that this matter should receive further consideration by the Municipal Council with the view of determining whether additional officers are required in order that there may be uninterrupted supervision wherever the works are in progress. The Board would therefore recommend that the City Engineer be called on to furnish a report on this point with as little delay as possible."

Although many of the charges originally made against the work have been disproved, and were, in the opinion of the inspector, dictated by *animus* against the contractor, it will be conceded that the inquiry was needed.

Utilisation of Sewage.—At a recent meeting of the Institution of Civil Engineers of Ireland, held in Dublin, Mr. G. H. Kinahan, M.R.I.A., read a paper which explained his plan for converting Merrion Strand into sewage meadows. Various schemes had been laid before the public to prevent and get rid of the ill effects of the Dublin sewage, but to him it appeared that no plan would be entirely successful unless the main sewers were discharged outside the heads of the Bay, that is, Dalkey and Howth: consequently, the cheapest mode of getting rid of the sewage was to utilise it, and the best mode of doing that seemed to be by intaking the large tracts of foreshore and cultivating them as sewage farms. The reasons for it being necessary to discharge the sewage outside the Heads would be seen after a study of the driftage due to the tidal currents. On the east coast of Ireland as far as the coast of Louth, the main driftage was northward with the "flow" of the tide; in the bays, however, there were complications due to the "counter-tides" induced by the headlands; and the half "counter-tides," a little before high water, generated by the on-shore current. Of these currents the one which principally affected the driftage was the first, or the "flow" tide, running along the coast from Dalkey, round Sandycove Point, into Scotch Bay, and thence into and past Kingstown Harbour to Booterstown Bay and the South Bull. This at Poolbeg appeared to divide—part entering the estuary of the Liffey, not so much as a current, but more as a filling up or raising of the water ("head of tide")—and a portion set east to the Rossbeg Bank. The effect of the driftage due to the current was very apparent in late years; as, since the construction of Kingstown Harbour, the *débris* carried by it has accumulated in Scotch Bay, margining the outside of the east pier, along which bank the *detritus* travels, part going into the harbour, which tended to fill up the western portion. Prior to the erection of the harbour at Kingstown, and subsequently to the building of the South or Poolbeg Wall, the driftage stopped by the latter gradually silted up the bay in the vicinity of Sandymount and Irishtown, where, at one time, there must have been deep water, as, in the times of De Gomme and Cromwell, hereabouts was the best landing in the bay. From what had already been said, it would appear that on account of the set of the "flow-tide" currents, all matter discharged into the Bay between Dalkey and Poolbeg during the "flow" of the tide must be carried north-westward to be lodged along the shore; while if discharged during the "ebb" a portion might reach the open sea, but the major part would meet the "flow" tide outside the Irish Sea, which began to run before the "flow" tide in the bay—and by it would be carried back again. The matter discharged into the Liffey inside Poolbeg during the "ebb" would divide, part being carried south-east for six hours, and part north-east for nine hours. The portion going south-east would meet the "flow" from the Irish Sea, and be carried back again, while much of that going north-east possibly might reach the open sea, but a considerable portion seems to be stranded on the North Bull Strand by the "half counter-tide" of the Rossbeg Channel. The principal works necessary to enclose this intake and divert the Dodder would be the construction of the "dyke" or outside sea wall (13,500 ft.); a canal (7,000 ft.) with north and south walls (14,000 ft.) through the intake; a gut with one wall (3,000 ft.) along the present shore-line; and to excavate a canal 1,700 ft. long, 120 ft. wide, and on an average 12 ft. deep; also, about 10,000 ft. of minor canals to catch and carry off the upland and storm waters. The sewers are not included, as they would have to be made either here or elsewhere. To catch and carry off the land drainage and storm floods two minor canals would be necessary—the first along the shore line from Seafield House to the south wall (3,000 ft.), and the second from the railway at Merrion to Belvidere House (4,800 ft.). These would empty, by tidal sluices, the first into the Liffey and the second into the canal. The area proposed to be intaken equals about 2,000 acres. These, if let at 5*l.* per acre, would give an income of about 10,000*l.* a year as interest on the money expended. This sum is a low estimate, if we may judge by the profit of the Edinburgh meadows. Mr. Ralph Richardson, F.R.S.E., Vice-President of the Geological Society, Edinburgh, and for many years its secretary, thus writes:—"The celebrated irrigated meadows of Craigentinny, near this city, and irrigated by its sewage, extend to about 163 imperial acres, and the annual rent of the whole is 2,906*l.*, or on an average 17*l.* 16s. per acre per annum. These meadows yield three to four crops of grass annually. The public health in their vicinity is, I understand, good. The meadows were once sandy tracts of little or no agricultural value. Now they are among the most valuable properties in the world—all because sewage (which was running to waste) was allowed to pass through and fertilise them."

A NEW CHURCH AT NEW SWINDON.

A NEW church, dedicated to St. Paul, has just been consecrated at New Swindon. This town has so much increased, owing to the immense number of *employés* at the Great Western Railway Works, that the present structure supplies a want for some time pressingly felt. The material principally used is red local brick, Stoke ground Bath stone being only employed where brick did not come in naturally. In plan the church has a nave 24 ft. span and 86 ft. long, with lean-to aisles 10 ft. wide; the two easternmost bays on each side projecting further, and gabled at right angles to the nave. There is a small north door, and a large western porch entered north and south. It is intended shortly to erect a chancel, with organ-chamber and vestry, and possibly a tower. At present the east wall is a temporary contrivance. The instructions to the architect were to design as simple a church as possible consistent with ecclesiastical propriety. Consequently, the clear-story is not high, consisting of cusped circular windows, the greater portion of the light being admitted through the three-light aisle windows. The nave arcade is carried on circular Forest of Dean piers with plain moulded capitals of square plan. The arches are of brick in square unchamfered orders. Internally the walls are pointed. Externally a few bands of Staffordshire grey bricks and a pattern or two relieve the expanse of red. The nave has a polygonal boarded ceiling, with tie-beams having brackets under, and moulded king-posts to the trusses. The aisle roofs are also panelled, but the trusses are filled in with perforated cusped panelling. All the wood to the roofs is left clean from the tool. There is a projecting pent-roof bell-cot at the west end. The floor under the space devoted to worshippers is laid with herring-bone wood blocks, on the solid system. There are no benches, but chairs of a special type, made of birch (from Aylesbury).

The passages at present are of rough paving, prepared eventually to receive tiles. A raised chancel arrangement, with temporary seats, altar-railing, &c., and pulpit, have been contrived. The font is of Painswick stone. The windows are glazed in ornamental lead quarries of cathedral rolled and white glass intermixed. Fresh air is admitted by air-shafts at intervals, terminating with Sherringham's patent valves, about 7 ft. from the floor. Externally the roofs are covered with Broseley tiles and terro-metallic ridges. The gable crosses are specially designed by the architect, and made by Messrs. Cooper, of Maidenhead. The gasoliers were also specially made by Mr. Court, of Brompton-road, who also arranged the hot-water pipes for the warming system.

The builder was Mr. William Jones, of Gloucester; and the architect is Mr. Edmund B. Ferrey. Simple dwarf enclosure-walls, and wrought-iron railings from the architect's design, are now in course of construction. The total expense has been upwards of 4,000*l.*

A NOVEL BANQUET.

A SUCCESSFUL attempt to begin a reform of public dinners was made on the 30th of June last, by a few members of the Mutual Life Assurance Society, which had features of sanitation and social enjoyment deserving of some notice in the *Builder*.

The apartment selected was airy and spacious, with, on two sides of it, glass, overlooking the beautiful gardens of the Crystal Palace, suggesting a kiosk on the Bosphorus. The ventilation of the room was excellent. Instead of long lines of tables, the company was made up of social parties of ten or twelve persons, each party at a table having its choice of friends. About 160 persons were present.

The programme of the repast was arranged so that the banquet should be completed in two hours and a half, and the festivity was carried through exactly in that time. The courses were less than half the usual number at great City feasts, and seasonable fruits and vegetables were freely introduced, with pleasant and useful effect. Melons followed the soup; after the *pièce de résistance* came iced asparagus, which was a striking feature of the dinner, and the introduction of gooseberry sauce with spring ducklings was another which touched the palate of all who tasted the combination. Three wines only were provided; but good champagne was the popular beverage throughout the dinner, and made good the dictum of Walker,—"Champagne right, nothing wrong." During the banquet there was no clatter of plates, &c., heard, but delightful music was given by the Crystal Palace musicians, and some eloquent speeches.

Each speech was announced by sound of trumpet, and, with one exception, was brief. The chairman (Sir Henry Cole) gave the health of the Queen in twelve words,—"Beloved by her subjects throughout the world, and respected by all others." Mr. Digby Seymour, Q.C., made an eloquent effective speech on "Our Institutions," only it was ten minutes too long, and good and short replies were made by Lord Clarence Paget for Parliament; the Rev. W. Blackley, for the clergy and their duty in preaching thrift;

Mr. Norman Lockyer, for science; and Mr. E. J. Poynter, R.A., for art. The reply for all our forces, "For defence, not defiance," was epigrammatically given by Admiral Sir Edward Inglefield, who called them our "mutual assurance"; and that for "Literature and the Press," by Mr. George Godwin, who showed how important the spread of sanitary knowledge would be to a Mutual Life Assurance Society, and asserted his belief, that under right management, throughout the commonwealth, the normal length of life might be raised to 100 years!

The great object of the gathering was to connect the Mutual Life Assurance Society, "having more than a million of pounds sterling in its till," with provident habits and national Thrift; and Mr. G. Bartley, the inventor and managing director of the Penny Bank, replied to the toast with judgment and brevity. Mr. Pritchard, one of the "Mutual" directors, to whom the carrying out of the banquet had been much indebted, proposed the "Recreation of the People and the Crystal Palace," and Major Flood Page well replied. Mr. W. Burchell, one of the founders of the Mutual, proposed its success, whilst deploring that his floods of eloquence were ruthlessly cut short; but he gave away an admirable history of the Society instead. The toasts concluded with the "Ladies," proposed by Mr. Brudenell Carter, with humour, saying the ladies were essential to mutual bliss. A remarkably fine display of fireworks terminated a pleasant and successful meeting,—so successful that it is to be repeated next year. Many of the suggestions were adopted from "Walker's Art of Dining," which has lately been republished.

ARTISTS' BENEVOLENT FUND.

THE seventy-second anniversary dinner of the Artists' Benevolent Fund took place on Saturday last, the 2nd inst., at the Freemasons' Tavern, the Right Hon. A. J. Mundella, M.P., in the chair. About ninety ladies and gentlemen sat down to table.

The Chairman, in proposing the toast of "Her Majesty the Queen, Patron of the Fund," observed that for forty-two years her Majesty had given the handsomest donation to the Fund, having contributed 100 guineas each year during that long period. Therefore the toast had a peculiar claim on artists. Moreover, her Majesty was herself no mean artist. In proposing the next toast, that of "The Prince and Princess of Wales and the other Members of the Royal Family," the Chairman spoke of the interest which H.R.H. the Prince of Wales took in the Paris Exhibition of 1878, and of the pride which he felt in the success which English artists achieved in that international contest. With the toast of "The Army and Navy, Militia and Volunteers," was coupled the name of Mr. Brock, who briefly replied.

In proposing the toast of the evening,—"Prosperity to the Artists' Benevolent Fund, with the President and Vice-Presidents of the Fund,"—the Chairman expressed his great regret that, owing to a recent and serious domestic bereavement, the President of the Fund (Mr. Beresford Hope, M.P.), was not able to be present on that occasion. They had also to regret the absence of another gentleman who had done infinite service to the Benevolent Fund, Mr. Dimond, the honorary secretary, who was unable to be present on account of ill-health. He had not the pleasure of knowing Mr. Dimond, but from what the President had said of him he had rendered most efficient services to the Fund for many years past,—services that were traditional in his family, descending from his father to him, and as he himself had two sons it was to be hoped that in due time they would continue the work carried on by their father and grandfather. Now he (the Chairman) hardly knew why he should have been selected to preside over the present gathering. He was not a critic, neither was he a connoisseur, although he knew what pleased him; but he was a lover of art, and should be very sorry indeed to live without it. He was there, he was told, because he was "officially connected with art." He happened to be Vice-President of the Council, and in that capacity had to propose to Parliament the votes of money for the great institution at South Kensington with which all artists were familiar. Perhaps it might be said that the reason why he was asked to preside over the dinner of the Artists' Benevolent Fund was because the national institution which he had named was doing more to manufacture poor artists than any other establishment. He hoped, however, that it would be conceded that that institution was of some value, and had done some good for art. He could speak, as everybody who had lived long enough could speak, on the wonderfully-improved taste of this country in all that related to the art of the common articles of everyday household use, particularly with regard to textiles. He himself was a manufacturer in a provincial town forty years ago, and thirty years ago he was an exhibitor at the Exhibition of 1851. Some of the best products that were exhibited at that time would, if now brought together and exhibited, furnish a "Chamber of Horrors," as far as art was concerned, that would rival anything that Madame Tussaud could show. When he thought of the curtains with large baskets and sprays of flowers on them, of the carpets with lions and other animals depicted on them, of the fearful and wonderful designs that exhibited themselves upon the walls of our houses, and of the furniture whose only characteristic was massiveness, he was disposed to be very tolerant indeed of those so-called "æsthetes" who were just now the subject of so much satire and ridicule. Modern æstheticism, even when it became a little effeminate, was infinitely better than the coarseness which prevailed thirty or forty years ago, and for his own part he would rather see a man worshipping a blue pot than worshipping a pink pot. He was quite sure that the somewhat sombre colours now used were better than the colours which were seen in drawing-rooms some years ago, together with a tremendous blaze of gilding and ponderous ornaments. When he (as one of the Royal Commissioners) was in Paris in 1878 for the opening of the Exhibition, he remembered standing in the international street, —the Rue Internationale,—when the preparations were completed, and while the representatives of the different nationalities were keeping secret the art-treasures they had to show. Seeing an inscription in the Fine Arts section, "École Anglaise," some of the French artists exclaimed, "The English School! There is no English school!" He spoke to his friend Sir Frederick Leighton, who was the friend of all artists, about the *badinage* to which the English representatives were being subject on account of the inscription referred to. Sir Frederick replied, "Wait until the opening day: they will then see whether there is an English school or not." When the opening day arrived he saw some of the great French artists stand almost aghast at the display of English art made at the Exhibition. As a lover of art, he preferred the modern English school to any other modern school. The English school was the only real school of landscape in existence. Since the revival of modern English art by Reynolds, Gainsborough, and Hogarth, England had made wonderful progress in art. Art had become a necessary part of the home life of all cultivated people. The jaded politician, and the hard-worked professional or business man, each and all felt that their lives were softened and humanised by art. Artists, then, had great claims upon the community. They must have every faculty in full and healthy play if they were to be successful. The eye must be keen, the hand steady, and the head clear, and should any sense or faculty fail, the cunning on which the artist was dependent for his daily bread must fail with it. Connected with the institution which they had met together to support was the Artists' Annuity Fund. By subscribing to it artists provided for themselves in sickness and old age, but while making this provision it sometimes happened that the bread-winner disappeared from life's scene, leaving behind him a wife and children. It was then that the Artists' Benevolent Fund came forward and gave assistance to those who were left to face the cruel mercies of the world. During the past year the institution had given annuities to sixty-five widows and fifteen orphans, the amount so expended being 1,316*l*. The year, he was glad to see, had not been an unprosperous one. He might mention that one lady, Miss L. Pye, herself the daughter of an artist, had added 500*l*. to the fund for widows, and also given 100*l*. to the Institution in lieu of further annual subscriptions.

The toast having been acknowledged by Mr. J. Absolon, and the health of the chairman drunk on the proposition of Mr. Willmore,

The Secretary (Mr. Lambton Young), read out a list of donations amounting to more than 1,200*l*., in which were included 100 guineas from the Queen, and 100*l*. bequeathed to the fund by Miss Landseer.

Mr. Forbes Robertson proposed "The President and Members of the Artists' Annuity Fund," for whom Mr. Willmore responded, urging the claims of the fund on young artists. He expressed regret that, with the increase in the number of artists, there had not been a corresponding increase in the number of members of the Annuity Fund.

Mr. W. Cave Thomas, in proposing "The Royal Academy," said that whatever critics might say of it, gratitude was due to it for having kept alive the traditions of art during the Arctic period of taste corresponding to the earlier part of the present century. He urged that the Academy should not, however, rest content with meeting the wants of modern taste, but should endeavour to elevate and refine that taste. He referred in terms of satisfaction to the mark of distinction just conferred by her Majesty upon the Society of Painters in Water-colours,—henceforth to be known as the Royal Society of Painters in Water-Colours, and he trusted that it would be the object of the Society, as well as of the Academy, to show to the public what should be the highest aim of art.

Mr. J. H. Mole proposed "The Honorary Physicians and Medical Officers," coupled with the name of Mr. E. Symes Thompson, who briefly acknowledged the toast.

Professor Guthrie, in proposing the next toast, "The Artists' General Benevolent Institution, and the Societies connected with the Fine Arts," said it was his good fortune to be able to reckon amongst his intimate friends some of the men who stood highest in the scientific world, and he could assure the assembly that the higher one went in the ranks of science the greater was the appreciation of the graces of art. Why should it not be so? That man who had most faithfully watered the root called Truth, who had most diligently tended the stem called Knowledge, must surely be able to appreciate the flower called Art. There were those who would put into two separate and even hostile camps the adherents of Science and Art, ignorant of the fact that the two were co-terminous and co-existent, pervading everything,—both of them,—that was worthy of the contemplation of the human being. He therefore implored the scientific man not to shut his eyes to the mystic graces of art, and, on the other hand, he urged the artist not to close his ears against the sweet, solemn harmonies of natural truth.

The only other toast was "The Ladies," proposed by the chairman.

FROM ABROAD.

Dr. Schliemann.—The celebrated discoverer of Troy and Mycenæ, who has presented to the Berlin Museum the invaluable relics he found at Ilium, was recently made an honorary citizen of Berlin by the municipal authorities of that capital. It was resolved to invite Dr. Schliemann to a *soirée*, to take place on Thursday, the 7th inst., in the Berlin Town-hall, on the enrolment of that gentleman in the list of Berlin citizens. The address welcoming the *savant* in his new capacity was to be delivered by the well-known physiologist and politician, Dr. Virchow.

Building Exhibition at Brunswick.—An important exhibition of tools and materials employed in building in Germany was opened by commission on the 1st of July, in the name of the Duke of Brunswick.

The Gewandhaus at Leipsic.—The Leipsic Gewandhaus or Cloth-hall, which is best known in England and other countries on account of the important musical performances which have for many years taken place within its walls, will this year celebrate the four hundredth anniversary of its original foundation. The building arose in the latter half of the fifteenth century in consequence of the growing trade of Leipsic and the increasing importance of its fairs coupled with the necessity of a sheltered place for the transaction of business in textile fabrics and other commodities. The existing building, however, is not the original one, but was erected after its destruction in 1740. The celebrated Gewandhaus concerts will hereafter be given in another building.

Seats and Trees for the Streets.—Lord Brabazon has given the sum of 50*l*. to the National Health Society for the purpose of placing seats and planting trees, in suitable positions in London, for the benefit of foot-sore pedestrians.

ROYAL ITALIAN OPERA-HOUSE: RUBINSTEIN.

HERR ANTON RUBINSTEIN'S opera, "Il Demonio," appears to be considered by many a great success, and is drawing the public, but whilst admiring some doubtless very fine music which it includes, we should be glad to find in it a little melody, or at least an air or two that we could remember with pleasure. We looked for a gleam of sunshine, whereas the whole opera suggests one terrific thunderstorm, with the exception of the ballet music, which is light and graceful.

The singing of Madame Albani as the heroine, and of M. Lassalle as the "Demon," was magnificent, and the choruses were very finely rendered. Angels' visits are proverbially few and far between; this is to be the more regretted just now, as the charming Madame Trebelli made appearance in that rôle (we trust not her last), her inimitable voice and fine presence being, as ever, welcome. The scenery and appointments are admirable, and the costumes of the ballet, although not exactly becoming, are picturesque. Herr Rubinstein has long been a great favourite in London, but has never before so completely laid hold of the public as now. We know as a fact that he took away with him for three of his recent Recitals at St. James's Hall over 2,000*l.*, and, as the total result of his two months' visit to London, not far short of 12,000*l.*! The sums paid to the most prominent foreign musicians and singers are enormous. Madame Nilsson, for example, will not sing in an oratorio for less than 250 guineas, and Madame Patti requires half as much again. Admit that these two ladies have attained the highest position in their profession and as public favourites (and these things are not always synonymous), it must still be allowed that they make us pay dear for their whistle. Too often an enterprising *entrepreneur* who has been fortunate enough to persuade High Talent to sing for him, finds, when he has paid High Talent's high price, the orchestra, the hire of the room, and the fees of the subsidiary singers, very little left to reward his enterprise.

FROM FOREIGN AND AMERICAN SERIALS.

Wiener Zeitung (Vienna, June 21).—On the 21st of June a meeting was held in the hall of the Austrian Institute of Architects and Engineers, to establish an Austrian Sanitary Association. A committee was appointed, composed of sanitary inspectors, town councillors, civil engineers, and scientific men, to carry out the object of the society, which is to promote sanitation, both generally and locally.

La Revue Industrielle (Paris, June 29).—A premium of 25,000 francs has been offered by the King of the Belgians for the best paper upon a complete and economical water service for large towns. The quality of the water is made an important point, and the system has to be calculated to meet the growing demands of an increasing population. The premium will be awarded in 1882. Belgians alone can compete, but the papers cannot fail to prove of general interest.

The Iron Age (New York, June 2).—Referring to the insecurity of iron columns and girders in case of fire, a plan is mentioned which has been recently patented in America. This is to fill the columns and girders with water, a communication being made between all the columns in a building, and an escape-pipe being carried through the roof, and left open to the air. It is suggested that if this were done the columns would stand perfectly firm, even if the building were consumed.

The New York Herald.—Writing on the subject of employment for women, this paper says that many of the branches of decorative art have been successfully undertaken by them, especially in the West. Amongst these is wood-carving, by which work a lady in St. Louis is said to have earned over 500*l.* last year. This town and Cincinnati appear to take the lead in offering facilities to women for undertaking this class of work; and in the latter place a private female school of wood-carving has been established, and is meeting with great success. In the Cincinnati School of Design, there were lately 138 female students to 17 male in the wood-working classes; whilst at a recent exhibition of woodwork at this school, out of 156 specimens, 138 were executed by women.

The Mechanical Engineer (June 18).—A report is published of the meeting of the Polytechnic Association of the American Institute, held on June 2nd, at which Mr. Partridge gave a review of ancient and modern inks. He explained that the former were, as a rule, intensely black, and almost indelible by time or chemical action; but that, as their bases were chiefly carbon and gum, they were easily removable by washing. Modern inks, on the contrary, are chemical blacks, and resist washing; but they are easily removed by chemical means, and being largely composed of iron salts, fade with time. Mr. Partridge was of opinion that much blame was laid upon ink for faults of the paper written upon, as he believed that the chemicals remaining in the paper had much to do with the change of colour. Aniline inks of all kinds are objectionable, being very fugitive: some of them even show signs of fading within a year or so. Logwood inks are also to be avoided; for, although they write very black at first, they are liable to change from the slightest causes. For simple durability,—where there is no fear of the writing being tampered with,—there is nothing better than Indian ink, which can easily be made to flow freely, by the addition of a little carbonate of ammonia.

The Scientific American (New York, June 25).—In a paper on "The Problem of Healthy Water," the difficulties and uncertainty of water analysis are discussed, and it is pointed out that the great desideratum is a practical and trustworthy determination of the substances contained in water which are capable of fermentation. This might be effected by the use of different reagents, and the various animal and vegetable forms could be classified as harmless and harmful.

BUILDING LAND AT WANSTEAD FLATS.

A SHORT time ago, about nine acres of land, in close proximity to Wanstead Flats, were awarded by the umpire, Sir Arthur Hobhouse, Q.C., in settlement of Mr. George Borwick's claim against the Commissioners of Epping Forest. Subsequently to the award, it became known that the intention was to lay out the land and dispose of it in small plots for the erection of cottage property and artisans' dwellings, which it was feared would depreciate the value of larger houses in the locality around. In order to prevent this, negotiations have been in progress with a syndicate composed of gentlemen locally interested in the district, the result of which is that the land in question has just been sold to those gentlemen by Mr. William Houghton, of Old Broad-street, for the sum of 9,000*l.*, being at the rate of 1,000*l.* per acre. The purchase has been made solely with the view of preventing the land being let in small plots, and it is understood that it will shortly be re-sold in lots suitable for the erection of residences of the villa class.

SMOKE ABATEMENT.

THE Board of Trade has officially declared the Exhibition of Smoke-Consuming Apparatus, Fuel, &c., to be held at South Kensington, from October 20th till November 26th, to be "calculated to promote British industry and prove beneficial to the industrial classes," thus conferring protection on all inventions exhibited during the time of exhibition, and for six months afterwards (in virtue of the Protection of Inventions Act, 1870). The Secretary of the Admiralty, Mr. Trevelyan, has also forwarded a communication promising that the Admiralty will favourably consider applications for trials of apparatus at one or another of the dockyards, in case the size and character of the appliances should in particular cases exceed the capabilities of the testing places already provided.

These communications were read at a special meeting of the committee, Mr. Ernest Hart in the chair. Present among others, Sir Frederick Pollock, bart., Sir A. Brady, Lady Borthwick, Miss Shaw Lefevre, Prof. Roberts, F.R.S.; Mr. Atchison, Miss Kate Potter, and Mr. W. R. E. Coles, hon. sec. At the same meeting it was resolved that a public meeting should be held to report progress and to inform the public and all interested of the forward state of the existing arrangements, and a hope was expressed that the Duke of Westminster, would allow the meeting to be held at Grosvenor House. It was mentioned that, in addition to premiums conferred by the committee, a series of extra prizes would be arranged, including a ladies' prize for the best smoke-consuming domestic grate, and that Mrs. Rathbone, of Kensington, had headed the latter prize with a subscription of ten guineas.

PICTURES PURCHASED BY THE ART-UNION OF LONDON.

THE following is a list of the principal works selected by the prize-holders of 1881:—

From the Royal Academy.—At Last, Arthur Stocks, 290*l.*; The Naughty Boy, C. T. Garland, 150*l.*; At Newark Priory, Surrey, F. W. Hulme, 150*l.*; Shelter: A Rainy Day, Walter Hunt, 75*l.*; Backwaters, Hurley-on-Thames, Chas. Smith, 76*l.*; A Ferry on the Trath at Tan-y-Bwlch, J. Jackson Curnock, 60*l.*; Dolgaroy Mill, South Wales, Chas. L. Saunders, 45*l.*; Yorick and the Young Hamlet, W. K. Stevens, 35*l.*; Stoke, Suffolk, Robt. W. Fraser, 30*l.*; Treasures, M. Goodman, 30*l.*; "Well, Pussy!" Haynes King, 30*l.*, Clouding Over: A Valley in North Wales, John Whipple, 30*l.*; Parting Day, W. Ayerst Ingram, 26*l.* 10*s.*; Spring-time: Isle of Wight, W. Sidney Cooper, 25*l.*; Mending the Net, Edwd. Elliot, 25*l.*

From the Society of British Artists.—A Visit from Brother Dominie, W. Dendy Sadler, 100*l.*; The Village Bridge, P. Macnab, 70*l.*; Stormy Weather: on the Mole at Leatherhead, C. Gibbs, 60*l.*; Every Little Helps, C. S. Lidderdale, 50*l.*; Some one Passing, Haynes King, 45*l.*; Prayer, Wm. H. Weatherhead, 45*l.*; Heroes, C. Cattermole, 40*l.*; Amongst the Rocks and Ferns, E. Holmes, 40*l.*; Mammy's Pocket, J. C. Waite, 40*l.*; Breezy, G. S. Walters, 40*l.*; A Parley, A. W. Bayes, 35*l.*; On the River Mole, W. H. W. Foster, 35*l.*; Sunshine, E. Holmes, 35*l.*; Barrow-on-Trent, James Peel, 35*l.*; "When the wind is in the East, then the Fishes bite the least," W. Dendy Sadler, 35*l.*; A Highland Drove, Geo. Turner, 35*l.*; The Silvery Thames by Shiplake Island, W. H. Gosling, 30*l.*; A Gipsy Nymph, J. Gow, 30*l.*; Bolton Abbey, N. E. Green, 30*l.*; A Breezy Day, P. Macnab, 26*l.* 5*s.*; Deer in Richmond Park, Sir R. P. Collier and W. Severn, 25*l.*; The *Times*, Haynes King, 25*l.*; Cattle in the Marshes, W. Luker, 25*l.*; The Pairing, J. C. Waite, 25*l.*; Evening on the Thames, G. S. Walters, 25*l.*; Flotsam and Jetsam (a Sketch from Nature), W. Hemsley, 21*l.*; The Globe Room at the Reindeer Inn, Banbury, G. R. Clarke and C. Cattermole, 20*l.*; On the Upper Thames near Godstow, W. Gosling, 20*l.*; Taking Advantage of Granny, Miss A. Grant, 20*l.*; Pets, E. Hume, 20*l.*

From the Royal Albert Hall Gallery.—St. Michael's Mount, Cornwall, S. Hodges, 46*l.*; "The Curfew tolls the Knell of parting Day," A. Morris, 40*l.*; "Scarce a Gleam of azure Heaven," J. Anderson, 35*l.*; Watering Horses, Miss M. E. Greenhill, 35*l.*; Walsh Hall, near Coventry, J. Anderson, 30*l.*; First at the Trysting-place, Miss E. Turck, 20*l.*; Shrimpers on the Beach, Evening, G. A. Williams, 20*l.*

From the City of London Society of Artists.—Covenanters on their Way to Prison, Miss E. Connelly, 42*l.*; Ardvorlich, Loch Lomond, J. J. Bannatyne, 20*l.*; A Rat, H. H. Couldery, 25*l.*; The South Downs, near Eastbourne, Alfred Powell, 25*l.*

From the Society of Painters in Water-Colours.—Sheep feeding, Winter, Edward Duncan, 75*l.*; Conway Bay, S. P. Jackson, 36*l.* 15*s.*; Azalias, Mrs. Angell, 35*l.*; Llanstephan Castle, S. P. Jackson, 31*l.* 10*s.*

From the Institute of Painters in Water-Colours.—The sacred Island, "Philæ," on the Nile, Chas. Vacher, 48*l.* 6*s.* At Lustleigh, Devon, J. H. Mole, 30*l.* 10*s.*; The Ford, Chas. Cattermole, 21*l.* 5*s.*

From the General Exhibition of Water-Colour Drawings.—Awaiting Sentence, F. G. Cotman, 35*l.*; "Where the Reeds and Rushes quiver," W. G. Addison, 30*l.*

THE LONDON SANITARY PROTECTION ASSOCIATION.

AMONGST the new companies registered last week is one giving to itself the above designation. The objects of the association, as stated in the deed of registration, are to provide inspection and advice with a view to ensure and maintain the proper sanitary condition of buildings; also to promote sanitary science by the collection of data, statistics, and information, and to diffuse the knowledge so acquired by lectures, meetings, and exhibitions, and by printing and publishing the same. No capital is named in the deed, which states that the association is registered under a licence by the Board of Trade as being "limited by guarantee, and not having a capital divided into shares," on condition that no portion of the income or property of the association shall be paid "directly or indirectly by way of dividend, bonus, or otherwise howsoever, by way of profit to the members of the association."

THE CHURCH OF ST. MARY OVERIE.

WITH reference to an observation in our recent notice of Mr. Dollman's book, that gentleman says,—You refer to my representation of the original thirteenth-century groined roof as conjectural. When the oak roof (which had been erected in 1469, after the fall of the original roof) was removed, *circa* 1831, traces of its predecessor were brought to light, and on drawings, by Mr. Gwilt, showing the longitudinal section of the old nave (the walls of which were not finally destroyed till about 1838, the building remaining between 1831 and 1838 a

roofless ruin) indications of the wall ribs of the original groining are shown, and some of the stumps of the groining above the vaulted shafts also appear, so that I had data for showing the height and design of the original roof, in addition to which there still exists a fragmentary stump of the original groining on the north and south sides of the nave, adjoining the tower, which, with the piers of the arcading of the old nave, were left standing, probably for constructional security, when the rest of the nave was taken down in 1838.

On several drawings by Gwilt I find sections of the oaken ribs belonging to the roof of 1469, as well as accurate plans of the groining of that roof (shown on plate 19 in my book).

FIGURES AND FANCIES.

THERE is a peculiarity about the date of the present year of Grace which may afford materials for those who are seeking for omens and portents in these terrible times, and which, so far as we know, has not before been pointed out. The date 1881 reads the same either from left to right or from right to left, as it does also if read upside down. Some thousands of years must elapse before it will be possible to say the same thing again,—not, indeed, before the year of our Lord 8008. Eighty years hence, namely in 1961, it will read the same upside down, but not, as in the present case, from left to right and right to left.

The figures of the current year, 1881, are divisible by 9, giving 209 as result, and added together the four figures make 18, also divisible by 9, or making 9 when added together.

PATENT RECORD.*

APPLICATIONS FOR LETTERS PATENT.

2,653. W. Barton, Boston. Stoves. June 17, 1881.

2,662. A. M. Clark, Chancery-lane. Manufacture of cements, &c. (Com. by E. E. A. Sorel, Paris.) June 18, 1881.

2,686. A. Damman & A. Cassard, Brussels. Parquet flooring. June 20, 1881.

2,743. H. H. Lake, Southampton-buildings. Construction of pavements, &c. (Com. by D. McLean, New York, U.S.A.) June 22, 1881.

2,751. D. Church, Southwark. Forming joints in leaden pipes, &c. June 23, 1881.

NOTICES TO PROCEED

have been given by the following applicants, on the dates named.

June 21, 1881.

702. G. Butler, Chiswick. Floor-Cramps. Feb. 18, 1881.

705. F. W. Fletcher, Westminster. Metal substitute for putty. Feb. 18, 1881.

769. H. Lecornu, Caen, France. Apparatus for Cooking and Heating. Feb. 23, 1881.

1,302. T. Parker, Coalbrookdale. Grates and Stoves for burning Anthracite Coal, &c. March 23, 1881.

1,564. R. Wild, Littleborough and H. Ledger, Leek. Treating and Purifying Sewage, &c. April 11, 1881.

June 24, 1881.

926. G. Maw & A. Maw, Broseley. Decorating Bricks, Tiles, &c. March 4, 1881.

1,091. A. M. Clark, Chancery-lane. Tiling for roofs, floors, &c. (Com. by J. J. Williams, Fairhaven, U.S.A.) March 14, 1881.

1,714. C. R. Stevens, Lewisham. Heating and cooking by gaseous, liquid, or solid fuel, &c. April 20, 1881.

ABRIDGMENTS OF SPECIFICATIONS

Published during the Week ending June 25, 1881.

4,647. S. Mayell, Rochester. Apparatus for sifting Portland cement.

Sieves are used, which are made to revolve rapidly, and thus the cement is strained or sifted. Nov. 11, 1880. Price 6d.

4,684. T. J. Constantine, Fleet-street. Furnaces, ranges, &c.

Various streams of air are directed into the fire to consume the smoke. The door is formed with four parallel plates, and the air entering the bottom of the outer plate is led up and down between these plates until it passes into the fire from the top of the inside plate, being greatly heated in the passage. Small streams of air are also led along the sides of the fire-basket, also becoming heated in the passage, and discharged into the fire at the back. The "bottom-plates" of furnaces are also made to introduce air in the same manner. The upper surfaces of the fire-bars are grooved so that the fine ashes may lodge therein and act as a non-conductor of heat. Nov. 13, 1880. Price 6d.

4,722. F. Wirth, Frankfort-on-the-Main. Manufacture of bricks for building.

To make bricks which shall be extremely light and at the same time quite firm, the following substances are used,—Pulverised cork, clay or sand, hydrate of lime, and soluble glass: to these a suitable quantity of hair and fibre for binding purposes and sufficient water are added. (Com. by C. Grunzweig & P. Hartmann, Ludwigshafen-on-the-Rhine.) Nov. 16, 1880. Price 6d.

4,735. D. Brown, Huddersfield. Syphons and traps for sinks, drains, &c.

This syphon traps the foul air or vapours from the drain, whether there be water in the syphon or not, in the following manner. In the induct-pipe is formed a globular space in which is a ball of any buoyant substance, coated with indiarubber, of a larger diameter than the pipe. When there is water in the syphon, this holds the ball against the induct-pipe mouth, and when there is no water in the syphon the ball rests on the educt-pipe mouth, closing the syphon in both positions. Nov. 17, 1880. Price 4d.

4,762. J. Sawyer, New North-road. Register stoves, &c.

A combustion-box is fitted at the back of the stove, fitted with flues by which the products of combustion are led to the box, and there consumed by fresh currents of air. (*Pro. Pro.*) Nov. 18, 1880. Price 2d.

4,959. H. A. Bonneville, Cannon-street. Bricks for borders of paths, walks, &c.

This is an improvement on Patent No. 4,323 of 1878 in moulding the brick with an arch at its base, so that when the bricks are placed side by side they form a tunnel answering the purpose of a drain-pipe for water (Com. by E. Beaucantin, Rouen). Nov. 29, 1880. Price 4d.

SANITARY PLUMBING.

SIR,—There is a trite saying in some parts,—"Nae siller, nae sense,"—which is pretty often acted on as a truism in many of the relations betwixt employers and employed; but, although Mr. Hellyer and Mr. Smeaton may enjoy a considerable share of the former, yet I trust they do not even desire to monopolise the latter; indeed, Mr. Smeaton admits as much when he says there is no finality in any one man's teaching,—inclusive, doubtless, of his own. Therefore it is that I as a workman, in laying claim to a little of the latter commodity as the result of twenty years' practical experience, would like to offer a few remarks on the subjects about which Mr. Hellyer has already spoken.

To begin with the wiping of joints. I quite agree with Mr. Smeaton as to the soundness and durability of what are called "Scotch" or "Yankee" joints; and apparently the Scotch and Yankee peoples must do likewise, since they find the joints to answer all their practical purposes, which are quite as varied and as important as those of London. If there be no difference, then, in utility, the question of superiority must lie in economy of material, taste in shape, and ease in making. To take the last point first. I rather think that the long joint is the easier to make, as you have a greater body of metal to retain the heat while it is being made; and, with regard to the second point, it must evidently be a matter of individual opinion, my own being that the short joint, the longitudinal section of which approaches the form of an ellipse, with solder proportionate to the strength of the pipe, is much neater; and, in respect of the third point, much more economical than those long joints which are too often to be found wiped bare a considerable way inwards from the cleaning. In the case of brasswork with short linings, the bulk of the solder in long joints extends along the solid pipe, away from the junction where the strength is really required, thus being a palpable absurdity and the very reverse of what ought to be, since the tinning on brass is not so adhesive as that upon lead.

The same remarks may be applied to branch-joints in all positions and sizes, that is, the joint should take the elliptical form, and the size be proportionate to the strength of the pipe. I think that joints as recommended by Mr. Hellyer create a waste of solder, much of it being superfluous. As an example, he shows a 1½-in. joint about 4 in. long, which to my thinking would be equally effective, much neater, and more economical at 2¾ in. or 3 in. in length. What "sense," I would ask, consists in putting such a mass of metal on a waste, overflow, or soil pipe? True, sometimes the plumber, in his zeal for economy, puts it only half-way round the pipe, as in one I lately witnessed taken out of a large house in the west of London, the joint being tinned all round and well formed in the front, while the blade of a knife could be passed through the junction at the back. About the making of joints in a single heat or without the use of the plumber's iron, I have only to say that I trust the former is neither a rarity in Mr. Hellyer's experience, nor the latter a rarity in that of Mr. Smeaton.

The manner of making bends on light lead pipes is also subject to variations of opinion. I think Mr. Hellyer quite right in maintaining the use of the "dummy," so far as in bending any size of pipe from 3 in. upwards; while at the same time, I think the "traveller" to be more useful in the smaller sizes; but I doubt very much if either Mr. Hellyer or Mr. Smeaton would allow sufficient time to the workman to make the substance of the outer and inner parts of a bend of a uniform thickness, and, indeed, even then its certainty could not easily be ascertained without cutting. The method of throwing a deep "kink" into a bend before dummying, as many plumbers do, is highly objectionable, as it tends to thicken the lead at one small spot, and to form "buckles" which cause a considerable loss of time in re-dressing. It is much better, in seeking uniformity, to bring the bend up gradually, bending and dummying frequently. With regard to the heavy pipes used in ship-plumbing, I may state that I have seen many and made many bends of varied and tortuous forms with the large bolt and fore-hammer, for scuppers, bilge-pumps, &c., and that under the conduct of men of the highest standing in their art.

Undoubtedly the very best bend is that which is drawn, in the same manner as the patent pipes or the American P or S traps. They are perfectly equal in substance, but as bends are required in all manner of lengths and shapes, it is not always found practicable or advisable to use them. Hand-made bends with one or two drawn seams, may be made very easily, very equal in substance, and of any length or shape, with the exception of making the one bend at right angles to the other, while at the same time, you have a better choice of material; many of the patent pipes being of very inferior metal, which will sound like a bell on being tapped with a mallet, and, in fact, is sometimes so brittle as to break across on being bent. The hand-made bends are used by some of our most eminent sanitary engineers, and, to my thinking, have only one fault, which is, that where acids abound, the seams are liable to rapid corrosion; but to this evil inferior patent pipes are equally liable. A good bend may also be made by splitting the end of a pipe and proceeding as in the ordinary seamed bend, the loss of substance in the circumference of say a 4-in. pipe being only about 2 per cent.

As far as practical purposes usually require, bends may be made on small and moderately stout pipes, without either "dummy," "bolt," or "traveller"; but I question very much the ability of any plumber to do so and retain the original bore at the throat,—it being understood that the pipe is to be filled with neither water, sand, resin, nor any other substance,—since it is evident the bend must be dressed from the outside, and the slightest deviation from the circular form of the bore will materially lessen the area.

I quite concur with Mr. Hellyer as to the general necessity of traps in the present state of plumbing science, but I also hold that there are certain conditions under which the trapless closet may be used with safety; but I think that in the application of those conditions, a greater amount of discrimination is necessary than is usually possessed by either workmen or their foremen.

JOHN WHITELAW.

LECTURES ON PLUMBERS' WORK.

SIR,—I take the liberty to claim a word on this subject, having been a plumber as far back as to have to walk over the old London Bridge to work. It is the duty of our class to afford Mr. Samuel Hellyer every support in his lectures for giving such general information and outline, not only in making up various classes of actual work, but system and affinities in metals.

He must have had more than the general experience as a working man in the trade proper. His lectures, particularly in house-plumbers' work and ventilation, are quite comprehensive, and I should say will cause improvement in various sanitary points under the Health of Towns Act. It is not the place for plumbers to criticise, and many will agree that in the execution of work there are things to hit upon that do not come within the reach of drawings or specifications. I give the lecturer very much credit for his bold attempt before some of the best plumbers.

THOMAS PARE, Torquay.

* Compiled by Hart & Co., Patent Agents, 28, New Bridge-street, E.C.

THE CHAIR OF ARCHITECTURE, UNIVERSITY COLLEGE.

THE Council of University College have appointed Mr. T. Roger Smith the Professor of Architecture, and, at the same time, have recognised the valuable services of Professor Hayter Lewis by conferring upon him the title of Emeritus Professor.

OBITUARY.

The Late Mr. Frederick Ouvry.—The lamented death of this gentleman, which took place recently at the age of sixty-five, demands a note in these pages, if for no other reason than that Mr. Ouvry had long acted as Honorary Solicitor for the Royal Institute of British Architects, and notwithstanding his large and important practice as a member of the well-known firm, Farrer, Ouvry, & Co., of Lincoln's-inn-fields, was always ready to afford his advice. He acted also in the same way for the Royal Literary Fund, and, as one of the treasurers, was seldom absent from the meetings of that important and admirable charity. In a similar honorary capacity, as a Life Trustee of Sir John Soane's Museum, his services were always to be had, and always prized. Professionally, Mr. Ouvry acted, amongst numerous other important appointments, as the confidential adviser of Messrs. Coutts & Co., the bankers, and the value attached by the firm to his services is shown by the incident that, a few years ago, after the payment of his annual account, one of the firm handed him a blank envelope containing a cheque for 1,000*l.* Mr. Ouvry was a vice-president of the Society of Antiquaries at the time of his death, and, previously, had served for a time as president of that important society, between the presidency of the late Earl Stanhope and that of the Earl of Carnarvon, who now worthily fills it. Mr. Ouvry had suffered for some time from an internal complaint, and about two years ago resided for some months in Egypt with apparent advantage. At the funeral, which took place at Acton, and where there was a large attendance of private carriages, the Institute of Architects was represented by its officers, Mr. Macvicar Anderson and Mr. William H. White.

BUILDING A HOUSE ON A SAND HILL.

MR. J. J. DE KINDER recently presented the following communication at a meeting of the Engineers' Club of Philadelphia. We take it from the American *Gas Light Journal*:—

As I am not aware that it has ever before been attempted in the United States to build a house on the very top of a lofty sand-hill, exposed to all winds and weather, while simply depending upon, or rather by simply making the loose sand the agent to keep it firmly secured in its seat, I think a few words upon the construction of a signal station which I have just finished for the Maritime Exchange of this city, on top of the highest sand-hill of Cape Henlopen, may be of interest to some. The signal station mentioned will serve to report the arrival at, and departure from, the Breakwater of all passing vessels, to the Philadelphia Maritime Exchange by means of the Western Union Telegraph lines, which connect it with this city.

In the first place, it was necessary that the observer stationed in the building should have a clear and unobstructed view of the seaward horizon from south to north,—that is, seaward of the coast line. To obtain this it was necessary to erect the building on top of a hill which rises some 80 ft. above the level of the sea. But the building thus necessarily becomes exposed to every gale that sweeps that part of our coast, while it is absolutely required that it shall stand firmly planted in such a way that even a hurricane shall not shake it or make it tremble, as that would affect the sight of the telescope in the observatory.

The usual mode of securing is by building a foundation of screw piles, or of heavy timbers sunk into the sand. The latter mode has this disadvantage, that if the wind shifts the sand away from around the foundation, it becomes undermined, and its effect is thus destroyed. In order to be independent of all this, I designed what I consider a cheap and, at the same time, an effective anchorage for the building, in the following manner:—The building is of wood entirely. It has a cellar, above which are two rooms, one above the other, and the whole surmounted by the observatory proper. First, the ground sill is a square of 20 ft., made of yellow pine sticks, mortised together, and pinned with stout trunnels. The sill of the observatory is made likewise of heavy timbers, 12 ft. long. The two sills are joined together by four stout yellow pine corner posts, which in turn are mortised into both sills. The posts are 26 ft. in length; 5 ft. above the lower sill is the sill which supports the floor of the first room; 10 ft. above this is the sill which supports the upper room. Both these sills again are mortised into the corner posts. This structure is sheathed outside with German siding, inside with rough boards covered with felt, and again by tongued and grooved yellow pine boards. The observatory proper, octagon in shape, is securely mortised into the top sill, and is covered with a corrugated iron roof, conical in shape. The cellar is floored with 3 in. wood, and boarded all around on the inside of the posts. I first dug a pit in the sand, about 6 ft. deep and fully 20 ft. wide, on the bottom; I then laid the ground or cellar sill on this bottom, and built the structure; thus the whole depth of the cellar is sunk below the top of the hill, or the level of the sand. I then filled the cellar up solid with sand, and packed it solid all around the outside also; consequently the building is anchored in its place by the load in the cellar, some 100 tons in weight. I carried three heavy joists (part of the joists which carry the floor) through on one side of the building, and on these the kitchen was built, so that this is also independent of the sand under it. Since the construction of the station we have had some very severe blows, yet there is no more tremble in the building than if built of stone on a rock.

A few feet from the building stands a signal-post or mast, 100 ft. high, which carries a 5-ft. ball of rattan covered with canvas. The ball is made to slide on the mast, and is used to answer signals from vessels by raising and dropping it. As it would, in my opinion, be a rather dangerous thing to simply place a mast in the sand,—no matter how deep,—I sank a well into the sand-hill. This well is made of pine, 20 ft. deep and 8 ft. square. The mast is placed in the centre of the well, and is braced, from the corners of the pine box, by some twenty stout braces, and the well afterwards filled and tightly packed with sand inside and outside, so that, like the house, to blow it over would necessitate the moving of a tremendous weight of sand with it.

ASPHALTE CARRIAGEWAY PAVEMENT.

At a recent meeting of the Streets Committee of the Commissioners of Sewers for the City of London, the following tenders were received for paving the roadway of Queen Victoria-street, from Mansion House to Cannon-street, area about 5,500 square yards:—

Name of Contractors.	First cost per sq. yd.	Maintenance for two years free of cost to commissioners, and for 15 years (after two years expired), measured over the entire surface, at per sq. yd. per annum.	Total cost of pavement to commissioners at expiration of 17 years at per sq. yd.
French Asphalte Co., 27, Cornhill, E.C.	13s. 6d.	1s.	28s. 6d.
Limmer Co., 85, Gracechurch-street, E.C....	13s. 6d.	8d.	23s. 6d.
Val de Travers Co., Old Broad-street, E.C. ...	13s. 10d.	6d.	21s. 4d.

The Committee recommended the acceptance of the lowest tender; and it should be further mentioned that at the expiration of seventeen years the pavement is to be left in as good a state and condition as when first laid down, and with a smooth and even surface.

Castleford, Yorkshire.—Further considerable additions are being made to Red-hill House, the residence of Mr. John Austin, J.P. The style of the buildings is Elizabethan, with stone dressings to all the windows and the main entrance, also a stone terrace to the front; and lead glazing to the top part of the windows. The contractor is Mr. Thomas Hemsley, of Carlton, near Selby. New workmen's cottages, with stabling, are to be built, the style of which will be Elizabethan, with stone dressings. The gables have ornamental barge-boarding and plaster cove to the eaves. The architects are Messrs. W. Lewis & Son, Stonegate, York.

THE LIVERPOOL LANDING-STAGE.*

THE accumulation of sand on the site of the landing-stage, opposite George's Pier, in the river Mersey, is no new thing. The northern end of Pluckington Bank always accumulates with quiet weather and neap tides. During the time of the old landing-stage, the boat occasionally grounded on this bank at low water of spring-tides. The writer has been down on the old landing-stage (about 1841-2), say at six o'clock a.m., at dead low water of a spring-tide, when the timber-barge at the outer end of the then landing-stage was aground on hard, dry, sand; but, the evening following, a south-westerly wind having been blowing at the same point, the boat was afloat in some 15 ft. depth of water, the tidal or rather outer-river scour having removed this bank to this extent in twenty-four hours. The weight of sand disturbed and moved by the tidal waters of the Mersey during rough spring-tides is something enormous. On the end of the small slip at the southern end of Princes Dock parade, the writer has known 12 in. vertical of sand to be deposited by one tide. During all rough spring-tides the great sandbanks outside, and the shore-deposits of sand within the river, are disturbed and shifted; the estuary sailing channels are altered, and new but only temporary conditions are brought into play. If there has of late been a continuance of smooth weather in the Mersey, during spring-tides, this may account for the greater temporary extension, northwards, of Pluckington Bank. A renewal of tolerably south-south-western gales, during times of low water of spring-tides, will, however, again, as formerly, sweep away this bank from beneath the stage-pontoons, without the aid of costly and most dangerous sluicing. The southern pier to the George's Dock basin rests on timber piles, and the writer has been under this pier amongst the piles, the sand having been washed away by injudicious sluicing in the basin. Rubble stone was thrown under and against the foot of this pier to cause the sand to accumulate, and care was taken not to allow the sluicing again to be directed against this pier. The whole of the site of the pier in question, of the river-wall in front of the baths, and of the area beneath the baths, was difficult ground,—a sort of quicksand,—so that to construct large sluices on this ground may prove to be a most dangerous, costly, and inefficient game; and, after all, Pluckington Bank may pay no attention to the sluicing operations when established. The Dock Trust is, however, rich, and may therefore be allowed to make ducks-and-drakes of a few thousands, or even tens of thousands, of pounds, and nobody care much about it. It may, however, be wiser to let flushing by powerful sluices alone, and rather to push the landing-stage further into the river, lengthening the connecting bridges, so as to secure deeper water and a fuller scour at all times of the tide. CIVIL ENGINEER.

WERE GIPSIES THE DISCOVERERS OF THE STOURBRIDGE FIRE-CLAY?

SIR,—The appearance in your number for June 25th of an interesting article on "Lye Waste and its Nailers" induces me to repeat a query that I have already addressed in several quarters without obtaining any satisfactory answer,—Were the discoverers of the Stourbridge fire-clay,—not Huguenot refugees from Hungary and Lorraine, but—Gipsies? According to the current tradition, given in Kelly's "Worcestershire Directory" (1872), they were tent-dwelling musicians; and from Mr. H. S. Grazebrook's "Collections for a Genealogy of the Noble Families of Henzey, Tyltery, and Tyzack" (1877), it appears that their descendants were dark-haired (p. 31), and that their ancestors were natives of Bohemia,—*Bohémien* being the French for "Gipsy." That they are styled "noble" need raise no difficulty, since instances abound of Gipsy dukes and earls, received as such by European magnates in the sixteenth and seventeenth centuries. On the other hand, there are several reasons for admitting the probability of my guess. In Denmark an unexplained name of descendants of Gipsies is *Glarmestere* ("glaziers"); and in Norway is a burial-place of Gipsies, who are said by tradition to have made bottles. In England, in the reign of Charles I., we find coupled together "chapmen, peddlers, *glassmen*, tynckers, palmesters,

* See the *Builder*, p. 6, *ante*.

fortune-readers, Egiptians, and the like"; and in the Potteries, in 1879, "half-gipsies" were employed in placing the pattern-mark on beer-mugs. The wandering "Potters" and "Muggers," too, of the Border shires at the present day have certainly a drain of Gipsy blood in them, employing, as they do, a good many Gipsy words; and the same holds good of wandering "Nailers," whom I have met in Wales. A good many other arguments, slight enough in themselves, but possibly worth something when taken in the lump, may be found in a late book of mine,—"In Gipsy Tents." The point, however, on which I have failed to satisfy myself is the antiquity of the tradition itself, on which my theory chiefly depends. If the discoverers of the Stourbridge fire-clay were really tent-dwelling musicians, it almost follows that they were not Huguenot refugees, but Gipsies. Can any of your readers carry back that tradition later than 1830?

F. HINDES GROOME.

"KING INA'S PALACE."

SIR,—With reference to Mr. Parker's letter in your issue of last week, asking for information as to the Mediæval house at South Petherton, Somerset, known as King Ina's Palace, I am glad to be able to say that I possess among my collection of examples of ancient domestic architecture, two photographs taken three days before the alterations were begun, in which the details are very clearly shown.

The first bears the note, "South-west view of King Ina's Palace, South Petherton, taken June 19, 1862. Restoration begun June 23, 1862." The second, "South-east View," with the same dates. I have also a photograph of the alterations while in progress, and another of the house when ready for occupation.

These photographs can be seen at my office, No. 18, Fenchurch-buildings, E.C., and I shall have pleasure in submitting them to Mr. Parker in any way that may be convenient to him.

It is much to be desired that a society should be organised to bring together carefully measured drawings of interior work, such as the well-known ones by Mr. Birch and Mr. Spiers, of the houses destroyed a few years since in Lime-street.

The privately-printed details of the house of Mr. Palmer, at Yarmouth, is also an excellent example of the work needed.

In the portfolios and sketch-books of our older architects there must be many interesting records of destroyed buildings, that might be usefully collected, and perhaps be made better known by photography, or other inexpensive mode of reproduction.

To my own knowledge, valuable drawings of public interest passed not long since into the hands of a waste-paper dealer.

ALFRED E ROBERTS.

THE WOOD CARVING AT THE HOUSE OF MR. LEOPOLD DE ROTHSCHILD, HAMILTON PLACE, W.

THROUGH the kind influence of Mr. J. Jackson, of the firm of Messrs. Jackson & Son, Rathbone-place, Oxford-street, the wood-carvers of London obtained, as you suggested they should, special permission last Saturday afternoon, from three to five, to see the work at the house of Mr. Leopold de Rothschild, a notice of which has already appeared in the *Builder*. Two hundred cards for admission were distributed by the Secretary of the Society of Wood-carvers, the majority of whom visited the house, and expressed their admiration of the work that has been done. The work in the library well sustains the character for which the Italian wood-carvers are well known, both for design and execution. At the same time, great credit is due to the firm of Messrs. Jackson & Son for the work that has been done by them, which will bear favourable comparison with any other work in the style; in fact, the whole of the work, so far as we were able to judge on Saturday, not forgetting the marble work by Mr. Forsyth, and the plaster decoration of the upper rooms by Messrs. Collinson & Lock, deserve great praise, and were very much admired. We hope to be allowed to see the work again when everything is finished.

W. SANDILANDS,
Secretary, Society of Wood-Carvers.
149, *Great Titchfield-street.*

ASHBURNHAM HOUSE.

SIR,—Mr. Philip Webb, in his letter to you (p. 30) implies, though he does not expressly state, that the question whether Inigo Jones was the architect of Ashburnham House must be decided solely by considerations of style. It is, I believe, the fact, though I have not yet had opportunities of examining the authorities at first hand, that no documentary evidence is at present producible on either side of the question. Nothing is known as to the year in which the house was built, though, as was suggested by a writer in the *Saturday Review* for March 19th, its history could probably be worked out from the records of the Chapter.

The biographers of Inigo Jones do not include the house in their lists of his works, nor is it mentioned by Walpole. So far as I know, all modern books ascribe the work to Inigo, but I believe that this attribution dates from about the beginning of this century only. If by Jones, the silence of his biographers as to so beautiful a work is remarkable. But there is still greater difficulty in assigning it with reasonable probability to any other architect. Every one, I think, will agree with Mr. Webb that it cannot be ascribed to Wren. But the school was very limited in number; to which of the followers of Jones or Wren could this exquisite design be allotted? It may, however, be, that the collections of Jones's drawings contain evidence on the points hitherto overlooked. Cunningham, in the "Handbook of London," seems to have carefully examined Inigo's drawings at Worcester College, Oxford, but not "some boxes of architectural drawings in the possession of the Duke of Devonshire." Have the latter ever been carefully studied? It is not impossible that direct evidence may be produced connecting Inigo Jones with Ashburnham House; meanwhile, the letter of Mr. Webb is valuable as conveying the opinion of an expert, given after careful study of the building.

ALFRED MARKS.

ARCHITECTS AND QUANTITIES.

SIR,—Your correspondent, "C. P." (p. 30), is displeased with my observations on this subject in your issue of June, 18. I ask any impartial reader if the same were not amply justifiable in answer to the challenge made to architects in the letter by "Quantity Man." "C. P." should read it. I accepted the challenge, and my combatant is, I feel sure, satisfied that it was at least an indiscretion on his part to assume such heroism. Doubtless, from "C. P.'s" point of view, my letter "would have been better unwritten." The facts, however, remain, and I am rather surprised that "C. P." should consider such statements of facts equivalent to throwing "mud" at surveyors. I hope "C. P." has not been touched in a vulnerable point.

In conclusion, I would inform "C. P." that I never attempt to take out quantities, nor do I profess to be able to do so, so that I have no hesitation in replying that "the contents of the 'snugly-packed nutshell' would have been less (considerably so) if 'H. H. B.' had carried out the work."

H. H. B.

*** We have received several letters on this subject, but do not find it desirable to print them.

THE ENGLISH LAND SYSTEM.

SIR,—It is simply absurd to maintain that the Land Laws are accountable for the depressed state of agriculture in this country. I hold my farm on lease at a low rent, and I assert it has been an impossibility to pay my way for the last five years without great loss, or for the last two rent free. I do not know what sort of seasons they have been in France, but from my knowledge of that country I should not advise any one to go there to learn farming, as the science is conspicuously deficient, and the small farmers are too poor to buy proper implements.

I have never seen 1,000 acres in England reserved specially for sport.

A YORKSHIRE FARMER.

VARIORUM.

"RHYMES in Council: Aphorisms Verified," is the title under which the veteran *littérateur* Mr. S. C. Hall, F.S.A., has issued * 185 reflections "based on experience, and matured by thought: the proceeds of a long life." They are remarkable for good sense, good taste, and good feeling, and include an enormous amount of useful teaching, pithily and pleasantly conveyed. We take one of the reflections almost at hazard to show the character of the lines:—

"Work! SELF-HELP is the Law that governs man;
The base and ground-work of God's perfect plan:
His will is that we work for what we ask;
Work with our hands or head: nor shirk the task.
Work! work! that with a boon a blessing brings:
Work is the lot of all created things,—
The earliest mandate of the King of Kings!"

There is not one of them that can do anything but good. We print a second. If it should lead only one of our readers to reflect and act in the right direction, the book will already have done good work:—

"What is the Drunkard's life? A life of pain,
Of sin, of sorrow, self-reproach, and shame,
Of home-affliction: evil wants, that drain
The home-resources: leave a filthy stain
On all its sacred ties: dishonour'd name!
Friends, estimate the loss, and count the gain!
Shun, as a plague, THE DRINK; a glimpse of light,—
It may be,—heralding a dismal night."

"Rhymes in Council" with the special sanction of the Queen, is dedicated to her Majesty's grandchildren, and we augur for it a long series of editions.——To the current number of *The Nineteenth Century* the well-known antiquary and writer, Mr. William J. Thoms, contributes a delightful paper entitled "Gossip of an Old Bookworm," wherein he shows, among other things, the riches he has gleaned during a long life from old bookstalls, and laughs to scorn those who have said that no one ever found anything worth having in the "sixpenny box." It is a charming gossip, full of erudition and genial remarks on old friends. Good and kind himself, he remembers only the goodness and kindness of those with whom he has had to do. It is to be hoped Mr. Thoms will be induced to continue his pleasant and instructive memories. ——Philip's "New Map of Middlesex, with portions of the adjoining Counties," by J. Bartholomew, F.R.G.S. (Philip & Son, London and Liverpool), is an admirable production of its kind. It is on a good scale, the writing very clear, and appears to be altogether satisfactory.

* Griffith & Farran, St Paul's Churchyard. 1881.

Miscellanea.

New Docks at Greenwich.—In addition to the Bill which has already received the sanction of Parliament for the construction of new docks at Dagenham, in Essex, a Bill has been passed by both Houses authorising also the construction of docks in the triangular-shaped promontory extending on the south side of the Thames, from Greenwich, by Blackwall, to near Charlton. A short line of railway is proposed to connect the docks with the Greenwich and Woolwich line of the South-Eastern Railway, and thus bring them into direct communication with the Great Northern, Midland, and Great Western Railways, *viâ* London Bridge and Ludgate-hill stations.

Eton Officers' Memorial Fund.—Over 1,400*l.* has now been received or promised in aid of this fund, which has been set on foot to commemorate the Eton officers who fell in the recent South African and Afghan campaigns. Plans for a memorial screen have been prepared by Mr. Street, R.A. These have been submitted by the Committee to the College, which has expressed its approval of them, and its desire, if possible, to facilitate the work by the removal of the present organ. Instructions have been given to the architect to furnish the Committee with specifications.

The Electric Light in Edinburgh.—At a meeting of the Town Council of Edinburgh last week it was unanimously agreed, on the recommendation of the Cleaning and Lighting Committee, that Princes-street, the North Bridge, and Waverley Bridge be lighted with the "Brush" electric light, as an experiment, for three months, at a cost of 389*l.*, and that the Committee have power to light Holyrood Palace-square with the same light during the Queen's visit in August.

A Wooden Palace.—The Japanese papers report that a new palace for the residence of the Mikado is about being built at Yeddo, which will be entirely of wood, and will cost 5,600,000 yen (nearly 1,120,000*l.*). There will be, however, a grand reception-hall, in which all grand State ceremonies will be performed, which is to be built partly of tiles and partly of wood, at an estimated cost of 170,000 yen (about 34,000*l.*)

The Scott Memorial Brass, Westminster Abbey.—We are asked to state that the memorial brass which is being placed over the grave of Sir George Gilbert Scott in Westminster Abbey, by public subscription, and which is from the designs of Mr. Street, R.A., will be uncovered by Dean Stanley on Wednesday next, the 13th inst., at twelve o'clock, when it is hoped that a few of the subscribers and friends may be able to be present.

Wimbledon Camp.—Messrs. Defries & Sons, of Houndsditch, have again been entrusted with the contract for lighting the Camp for the National Rifle Association, at the forthcoming meeting.

Southport.—Three stained-glass windows have been erected in All Saints' Church. The central four-light east window is an illustration of the "Te Deum," containing groups of figures representing the Angels, Apostles, Prophets, Martyrs, and the Holy Church. The principal tracery contains a figure of Our Lord seated in majesty, and the smaller traceries the four Archangels and groups of Cherubim and Seraphim. This window is flanked on either side by a two-light window; that to the north contains, beneath rich canopies, figures of SS. Matthew and Mark, and the tracery above, a seated group of Faith, Hope, and Charity. The window on the south side has figures of the other two Evangelists, SS. Luke and John, and in the tracery another seated group representing Temperance, Justice, and Fortitude. The windows were designed and executed by Messrs. Shrigley & Hunt, of Lancaster and London.

Tramways.—Major-General Hutchinson, of the Board of Trade, visited Portsmouth on Saturday afternoon, and officially inspected the Cosham tramway extension, which is now completed for more than half the entire distance, and passed it, the work, which was contracted for by Mr. J. Sheppard, of Chetwynd-road, Dartmouth Park, Highgate, being described as quite satisfactory.

Statue of Mr. Gladstone.—A statue of Mr. Gladstone, executed by Mr. Albert Bruce Joy, will shortly be sent to the foundry at Thames Ditton, and when cast in bronze will be set up in the East-end of London. It is presented to the citizens of London by Mr. Theodore Bryant, of the firm of Bryant & May, and is over 9 ft. in height.

Hammerwood Church, East Grinstead. Messrs. A. J. Arrowsmith & Co. wish it to be mentioned that the parquet floor in the chancel, carved oak reredos with illuminated letters, &c., and the carved oak communion-table in this church, were executed by them.

Royal Recognition.—The Queen has been graciously pleased to direct that the Society of Painters in Water-colours shall be henceforth called the Royal Society of Painters in Water-colours.

TENDERS

For covered homestead, Woodlands Farm, near Leatherhead, for Mr. F. C. Bryant. Mr. E. Saunders, architect:—

Lee, Cobham	£12,123	0	0

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

NOTICE TO SUBSCRIBERS.

THE INDEX and TITLE-PAGE for Volume XL. (January to June, 1881), are given as a Supplement with the present Number.

A COLOURED TITLE-PAGE may be had, gratis, on personal application at the Office.

CLOTH CASES for Binding the Numbers are now ready, price 2s. 6d. each; also

READING-CASES (Cloth), with Strings, to hold a Month's Numbers, price 2s. each.

THE FORTIETH VOLUME of "The Builder" (bound) will be ready on the 12th inst. price Twelve Shillings and Sixpence.

SUBSCRIBERS' VOLUMES, on being sent to the Office, will be bound at a cost of 3s 6d. each

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS TRADE, AND GENERAL ADVERTISEMENTS.

Six lines (about fifty words) or under ..... 4s. 6d.
Each additional line (about ten words) ..... 0s. 6d.

Terms for series of Trade Advertisements, also for Special Advertisements on front page, Competitions, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.

SITUATIONS WANTED.

FOUR lines (about THIRTY words) or under ..... 2s. 6d.
Each additional line (about ten words) ..... 0s. 6d.

REPLIES TO ADVERTISEMENTS,

Addressed Box ——, Office of "The Builder,"

Cannot be forwarded, but *must* in all cases be *called for*, and the Office Receipt produced.

THE CHARGE FOR A BOX IS AS UNDER:—

For "Situations Wanted" Advertisements ..... 3d. per Week.
For all other Advertisements ..... 6d. per Week

PREPAYMENT IS ABSOLUTELY NECESSARY.

*** Stamps *must not* be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, King-street, Covent-garden, W.C., to

DOUGLAS FOURDRINIER, Publisher,
Addressed to No. 46, Catherine-street, W.C.

Advertisements for the current week's issue must reach the office before THREE o'clock p.m. on THURSDAY.

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied *direct* from the Office to residents in any part of the United Kingdom at the rate of 19s. per annum, *prepaid*. Remittances payable to DOUGLAS FOURDRINIER, Publisher, 46, Catherine-street, W.C.

Best Bath Stone.

Notes on Roman Mosaic Designs.

In one corner of the Architectural Court at South Kensington, in the centre of which stands the cast of one of the most remarkable monuments of Roman greatness in arts and arms, is a not much noticed stand of drawings on a turning frame, which illustrates very largely the character of Roman art in one very beautiful and interesting class of work. These are the drawings collected by Dr. Wollaston, and presented to the Museum by Mrs. Wollaston, of Greek and Roman mosaic designs. The Greek designs, however, form but a small portion of the whole, the majority are Roman. The originals of a few of the examples hang in the corridor running down the centre of the Architectural Court; the originals of a good many others, including some of the best specimens, are in that cellar at the British Museum, reached by a staircase from the Græco-Roman court, to which so few visitors go, and where it is so difficult to see most of the specimens properly when one does go. A considerable number of the Wollaston drawings also illustrate specimens of mosaic, the originals of which are not in England, or not accessible to the public.

The variety in taste and style, as well as in merit, of these designs, is rather remarkable when we regard them collectively, and not less remarkable is the extent of resemblance we frequently find to some later school of design not generally supposed to be much connected with Roman influence. That there should be close resemblances between Roman and Renaissance design is, of course, natural, but we find new phases in the relations of the two styles when we consider mosaic, compared with what we find in considering Roman architectural carved ornament. The first drawing in the Wollaston set which we happened to turn to, for instance, a pavement found at Orbe, in Switzerland, looks singularly like a Renaissance ceiling design turned into a floor. The exactly reverse operation has, no doubt, been the origin of some of the Renaissance ceiling designs,—they have been suggested by Roman mosaic pavements. At present we only know of a few scattered examples of Roman mosaic, such as the one now referred to, which might suggest this form of panelled ceiling with little designs in brighter colour in the principal panels. But at the time of the Renaissance there might have been more numerous examples, of which many have perished since. The transplanting of the design from floor to ceiling is natural enough. Mosaic floors were not in such general use at the Renaissance period as to render it a natural thing to reproduce the Roman mosaic in the same position. The style of design shown in imitation panels in the Roman mosaics became reproduced in the real panelling and painted decoration of the Renaissance ceiling.

No one can doubt the connexion who looks at this and some other mosaic designs in the Wollaston drawings. But a more unexpected resemblance to some characteristics of Saracenic work is to be traced, and seems to us to have passed unnoticed. In a pavement from Fliessem, in Rhenish Prussia, is to be found precisely the arrangement which is common in many of the best specimens of Saracenic wall diaper; the arrangement of hexagons with squares subtending each side of the hexagon and filling up the intervening spaces. This pavement, indeed, suggests the idea that some one had got hold of a Moorish design and translated it into Classical detail. We are not accustomed to connect Saracenic work with Roman in any historical sequence; yet this strong resemblance can hardly be accidental. If one Roman design of this type has been found preserved to this day, we know not how many there may have been about in the times when Saracenic art took its rise, or how far the details of the latter may have been influenced by Roman forms which have passed away leaving hardly any traces. A large-scale diaper pattern which fills up the border of this Fliessem pavement is also very curious and semi-Oriental in style when regarded as Roman work, though it is not so much without its resemblances in other known Roman examples. It is an illustration of the liking of the Romans for patterns composed of curiously-intercepted segments of circles, a type also common in Saracenic work. Another design found at Fliessem is a remarkably fine instance of this, a very elaborate combination of circles and hexagons. Mosaic, in fact, lends itself so well to the working of what may be called puzzle-patterns that it is not surprising to find a good many of these among Roman mosaics. Sometimes, as in the case of a black and red design from Nantes among the Wollaston drawings, the patterns have the appearance of a kaleidoscope arrangement,—representing, it must be admitted, ingenuity rather than art. In fact, as we have observed, almost every degree of merit is found, from rough work which is commonplace enough both in its idea and its workmanship, to grand and bold design which represents almost the finest decorative character that can be obtained in mosaic, except for the want of that finish and neatness in laying which seems especially the characteristic of modern mosaic work.

Some people will consider the comparative roughness and irregularity of the Roman specimens an artistic advantage; and perhaps, when a mosaic design is on a large scale, and covers a considerable area, it does gain in effect by a certain degree of roughness and irregularity of line, and the appearance seems in keeping with the method and nature of the material. At all events, this rather irregular character of Roman mosaic should be taken into account when forming a judgment of the appearance of a design from drawings only. It is an almost ineradicable habit of draughtsmen, in making a drawing of antique ornamental work of this kind, to reduce it all to symmetrical neatness in every detail, and thereby a wrong impression of the effect of the original is conveyed. The difference between the effect of a drawing of this kind, and of the real work, is very perceptible on comparing the fine floor mosaic from Halicarnassus, which fills great part of the front room of the Græco-Roman cellar of the British Museum, with the drawing of it in the Wollaston collection. The drawing, for example, represents the border design of leaves growing from alternate sides of an undulating stalk as completely regular and symmetrical, and as if drawn out with the aid of compasses, whereas, in the original, the work is apparently put in by eye, or with the roughest measurement only, and is considerably irregular. In some other specimens in the British Museum this want of regular spacing and lining is so marked as to become a positive defect, and very disagreeable to the eye.

Besides the combination of intersecting arcs of circles, we find, as the most prevalent form in Roman mosaic ornament, a zigzag border, formed by alternate pyramids of dark and light, the joining-line giving the zigzag effect, in a manner similar to some forms of Celtic ornament. Various forms of the square Greek fret are found, few of them equal to the best Greek examples, however; in one instance, a piece of pavement found at Cotterstock, and now hanging on the wall of the Roman court at the British Museum, the Greek fret is used in a diagonal or lozenge shape, not very common in Roman work, and not at all Roman in appearance. A favourite form of diaper ornament, we regret much to have to say, is a design showing cubes shaded so as to appear in perspective, and as as if standing up edgeways from the floor-plane. Nothing could be in worse taste or look worse; and it is curious that this false taste for imitation relief seems to have beset the Roman mosaicist even in the middle of otherwise excellent work. Among the specimens from Carthage, in the British Museum cellar, for instance, is a large piece of very good and tasteful floor diaper, formed of rhomboids and squares, perfectly flat in appearance; but surrounding this is a border, the principal space of which is shaded so as to look like successive ridges and hollows. It does not seem to belong to the centre design in taste at all. The bead and reel ornament is frequently found, usually on rather a large scale; but it must be confessed it does not look effective in

flat work, where it loses the effect obtained by shadow on the surface and between the beads. But the favourite ornament of the Roman mosaicist, especially for borders and for marking the lines of construction, is the guilloche or intersecting rope pattern. This is forthcoming nearly everywhere; sometimes as a border, sometimes following all the main dividing lines of the floor pattern, sometimes carried out as a diaper twisting all over the surface, as in one very ingeniously devised specimen in the cellar at the British Museum. It shows a want of invention that we should find such constant repetition of a pattern requiring so little thought; but it must be admitted that it always looks effective, and suits mosaic work very well. Another ornament which occasionally occurs affords another link between Roman and comparatively recent ornamental schools; for here and there among the designs among the Wollaston drawings, and in one or two of the original specimens at the British Museum, occurs that same form of radiating scolloped ornament, something like a fan, which became such a favourite in the late Renaissance period in England, though in the Roman examples it appears, of course, shaded, and not in relief. A very favourite ornament, in medallions and circles, consists of a kind of intertwined loop or knot forming a cross; this belongs to the same class of ornament as the guilloche, but is even more commonplace, and much less effective, and certainly not worth introducing as a central ornament in the circles of a large floor design, as it often is introduced. Perhaps the finest of all the designs in the Wollaston drawings of this class of detail, is the pavement found in Shropshire, and consisting of a geometrical design of intersecting squares forming each a star shape, with octagons enclosing circles in the interspaces: the whole of the lines being marked out by a broad and bold guilloche ornament following all the intricacies of the geometrical forms. This is one of the finest examples there could be of the effect of simple geometrical design and detail, without any suggestion from natural forms.

But in the use of design derived from nature, the Roman mosaicist, sometimes quaint, is sometimes also exceedingly grand and bold in his treatment. This is especially the case in some of the specimens from Carthage at the British Museum. Two of these may be especially noticed; one, apparently, an angle of a large floor, with a head in the corner which has been supposed to represent Spring. From this stretches diagonally into the floor space a symmetrical pile of leafage in warm tones, and on either side of it the space is filled up by grand scrolls of conventional foliage in the freest and finest style. Another from Carthage, almost equally fine in its way, shows how much individual variety of taste existed when these were made, for this latter one, in the next compartment of the "cellar," is in a totally different style; it is a central portion of a large pavement, without the border, and contains heads arranged in squares and circles at equal distances from one another, and the spaces between filled in with beautifully delicate spray and leafage in quite a different style from the foliage in the last-named example,—much more realistic and lighter and thinner in effect, but still quite suitable to its position. The effect of the whole over a large extent of flooring must have been beautiful, if we get over the unsuitability of having designs for heads in that position, where they must be seen upside down from one side of the apartment. The same kind of defect,—the design for a floor of what ought properly to be a vertical design,—characterises also what is, nevertheless, a very remarkable and interesting mosaic, drawn in Wollaston's collection, and of which a large fragment is in the British Museum; this is also a Carthage specimen, and represents rows of vases with intersecting arches rising out of them, on which birds are occasionally perched, and in one place a meandering bit of blue is introduced to represent a river, and two stags drink from it, while beside them is worked into the mosaic, with curious *naïveté*, the word "Fontes." Nothing else in the design is explained, and it is difficult to understand the whim which induced the designer to give this one stray marginal note in the middle of the work. Among the Wollaston drawings a few more may be drawn attention to as especially fine and interesting designs. One from Roxby, Lincolnshire, introducing Greek border patterns a good deal, is remarkable at the same time for the very Saracenic characters of the diapers. A specimen from Hadrian's Villa is interesting as showing in the angles that use of vases with conventional foliage growing out of them which became such a pet feature of Renaissance ornament. An example from Cotterstock, a panel with a vase in the middle of it, is, however, remarkable for a treatment quite different from what the Renaissance ornamentists took up; for here we have not a realistic representation, but a highly conventionalised indication of a vase, so cleverly done and in a style so suitable to the material, that it becomes quite an interesting bit of ornament. Another from Cotterstock shows a very fine and elaborate treatment of the Greek fret pattern, often, as we observed, poorly treated by Roman designers. A drawing of a pavement from Vienne, in France, in squares divided off by borders with double rows of lozenges, and filled in with geometric designs, is remarkable for its very mediæval character; in this respect it may be compared with one in the British Museum cellar, described by the Museum authorities as of "pomegranates, flowers, and leaves, arranged in cruciform patterns" (one of the Carthage mosaics), and which is singularly like mediæval ornament in general character and construction. Among the finest in the Wollaston set are two, copied from specimens in the Vatican Museum. One of these is a floor diaper in black and white, of wonderful elaboration, and certainly one of the finest and richest diaper designs ever seen; in the centre, a panel contains a fine silhouette figure of an eagle and hare, a subject found rather frequently in Roman ornament. Another magnificent design from the Vatican collection is a circular centre panel with a half-figure of Minerva, with angle spandrels filled in with silhouette figures and foliage in black on white ground.

Among the mosaics which are more or less pictorial, or which deal with human and animal figures, there is a great variety of merit. Mosaic pictures, in the strict sense of the term,—pictures with backgrounds and landscapes and perspectives,—are rare; the rarity being, we may be allowed to think, not so much owing to any instinctive æsthetic perception in the Roman mind of the unsuitability of such subjects for mosaic, as to the practical difficulty of carrying them out at all in the material. The South Kensington Museum possesses one specimen (also figured in the Wollaston drawings) of a farm-yard scene, and a man milking a goat in the middle of the picture, which is excellent in execution, and is probably as well done as anything of this kind could be done in mosaic, but the result only shows that it was a mistake to attempt it. Among the animal life shown in Roman mosaics it is noticeable that by far the best things are the birds and fishes. The Wollaston drawings include one from Sta. Maria in Trastevere, representing fowls stealing snails out of amphoræ, which is remarkably realistic and true; and the South Kensington Museum contains an original specimen showing cuttle-fish and a lobster with great success. There are some finer examples of the same kind in the British Museum, however, one especially from Carthage showing fruit and fish and baskets. It is remarkable that the representations of quadrupeds are universally bad in drawing, although almost invariably spirited in action. Considering how the Romans could carve quadrupeds in sculpture, it is curious to find such a great inferiority in power in mosaic, and leads to the conclusion that an inferior class of artists were employed in the latter, in many cases at least. The best quadruped figure we have met with is a horse drinking, in a specimen in the Wollaston drawings, from near Barcelona; a charioteer driving in a circus (from Lyons), among the drawings, shows great spirit in action, but the horses' legs are mere spindles. In the British Museum specimens the best are one or two figures of lions, in which there is a great deal of go and and a little more appearance of anatomical truth than in the horses. Among human figures there is the greatest possible difference in execution, depending, perhaps, partly upon date; but the dates of these works are in very few cases known, so it is matter for conjecture. There is a figure of Europa on the Bull in the British Museum, in which it is difficult to say whether the curious proportions of the lower limbs are due to ignorance of the figure or to an attempt (quite unsuccessful, in that case) to represent the sitting posture by foreshortening the upper part of the limbs. Some of the figures shown in the Wollaston drawings are, at least, however, much better than this one; and fine heads are frequently to be met with. Among these the colossal head of a marine deity, in the British Museum, the upper portion of which is unfortunately missing, is a grand specimen; in its bold conception, with the broad masses of seaweed clinging to the beard, it is a fine example of that power and largeness of style which characterise the genius of Roman art, even when we cannot but feel that refinement and true taste are wanting. It is to be hoped that this remarkably interesting collection of Romar remains, at present in the ill-lighted cellar of the British Museum, will, now that the new abode for the Natural History collection is ready, soon be brought up to the light of day, along with many other things of great interest, now almost out of sight and knowledge. A study of the mosaic specimens there, coupled with the Wollaston collection of drawings at South Kensington, will even now, however, enable any one who wishes it to form a very good idea of the variety of character, the quality of design, and the effect in execution of Roman work in this fine and enduring form of decorative art. This quality of endurance is well shown in the British Museum specimens. Mosaic may, unfortunately, be rather easily broken up, and when once a building is abandoned or neglected, the floors are likely to be disturbed sooner even than the walls. But of the portions that have been preserved whole, many are as fresh as ever, and might be laid down as parts of a new floor to-morrow.

THE HISTORY OF OLD ST. PAUL'S.

Two works, of considerable value for the light they shed around the history of Old St. Paul's, have just been written by Mr. W. Sparrow Simpson, D.D., F.S.A., Minor Canon, Librarian, Succentor, and Junior Cardinal in the Cathedral, and Honorary Librarian of the Archbishop of Canterbury. The first of them is entitled, "Chapters in the History of Old St. Paul's," published by E. Stock, Paternoster-row, in an elegant old-style octavo, of 300 pages; the other a monograph entitled "Some Early Drawings of Old St. Paul's," forming a paper in the current number of the Journal of the British Archæological Association. Taken together, these two literary productions comprise a large amount of research which has rewarded the author with a store of new facts concerning the imperfectly-known character of the old cathedral church, its fabric, and its historical surroundings.

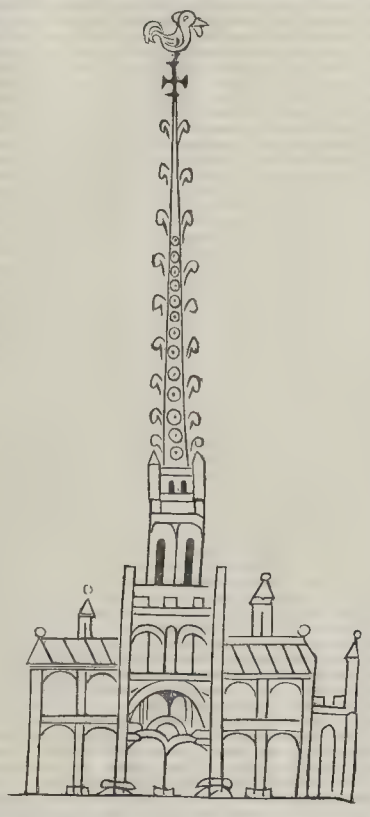
The early history of religion in London is shrouded, just as of that in other places, in a mystery which may never now be unfolded. The recorded mission of Fagnus and Dumanus by Pope Eleutherius to King Lucius, of Britain, has, nevertheless, withdrawn into the dim region of Christian mythology, and almost the only relic which still survives to cast any light for us upon the religion of the pagan inhabitants of ancient London is the little altar of Diana, which was found on the site of Goldsmiths' Hall, where it is still preserved as the choicest ornament of the court-room of that wealthy guild. But if the conversion of King Lucius be nothing but a myth, there can be no doubt that Britain, half civilised, and a conquest to the Roman arms, gradually fell a conquest, in like manner, to the faith of Christ during the second and third centuries. The names, indeed, of some who who were bishops in England in the fourth and fifth centuries have been handed down, but criticism has not altogether accepted their claims. Much has been written concerning the pre-Augustine Church in Britain, but, after all, illogical conjectures and imperfect inferences form the bulk of such writings, and it is not until the closing years of the sixth century that we get a definite date from which to take our stand, and to calculate the accurate history and fasti of the English Church. Thus the year of our Lord 597, the date of the advent of Augustine, is followed by the building of the first church of St. Paul by King Ethelbert, and the consecration of Mellitus to be its bishop at the hands of Augustine himself. Where Mellitus established his cathedral, doubtless there now stands the majestic cathedral of the metropolis, but in those far-off days a prætorian camp of the Romans (perhaps itself occupying a site previously fortified as an earthwork by the earliest inhabitants of England), or a heathen sanctuary, surrounded by trees and shady woods, may have stood upon the Pauline hill. No records, however, remain to enlighten us upon these points.

Probably a simple structure of unhewn

stones, like some of the earliest forms of edifices which still exist in Ireland, or a building of rough trunks, shaped by the axe, like that strange method of construction of which an example still remains at Greenstead, near Epping, and for which the suburban woods and forest would have supplied abundant materials, was the only edifice in which Mellitus and his little band of ecclesiastics chanted their services "where" now,—

"Through the long-drawn aisle and fretted vault,
The pealing anthem swells the note of praise."

Of Ethelbert's cathedral nothing whatever remains apparently, and nothing is known of it critically; future explorations may perhaps some day reveal a few relics of foundations which can be attributed to this age, but in the very nature of it any extensive excavation with a view to determine its site would be impossible. Fire, always the bitter enemy of St. Paul's, consumed the cathedral buildings in A.D. 961. But the edifice was restored in the same year. Again, on the 7th of July, A.D. 1087, a little manuscript in the British Museum, the "Chroniculi S. Pauli," records that "the church of St. Paul in London, and all things that were therein, together with great part of the city, were burnt with fire in the time of Maurice, Bishop of London." This second church was, in like manner, rapidly reconstructed. Again, in A.D. 1137, the cathedral fell a prey to the flames, according to the same manuscript, which relates that the fire on this occasion commenced at London Bridge, and extended as far as the church outside the bars of the New Temple of London. Nothing is known very accurately of the extent of the conflagration of 1137. Dugdale, following the generally trustworthy Matthew Paris, as quoted in Longman's "Three Cathedrals dedicated to St. Paul," places the date of this fire in A.D. 1136; Matthew of Westminster, another fair writer, places it a year earlier; and, as we have seen, the "Chroniculi" make the date a year later.



But the citizens of London loved their church too fondly to allow it to lie long in ruins. The work of rebuilding progressed under the fostering care of successive prelates and pious benefactors, and in due time the third church, that stately structure which is so familiar to us by means of Hollar's admirable etchings, arose, like a phœnix, upon the ashes of the second edifice, which had stood hardly half a century intact. When this was completed, there stood the cathedral church in its walled enclosure; to the north-west the bishop's palace; on the south-west the deanery; the greater cloister and the college-house of the minor canons on the north; on the south the lesser cloister, the chapter-house, the bakehouse, and the brewhouse. It was, without doubt, a grand sanctuary, full of all the details which went to compose a cathedral of those days, rich with many altars, shrines, images, and reliques; manuscripts of Holy Writ and ancient rituals; tombs of kings and saints; and well-worn places of famous pilgrimages. The lofty wall-mass of the lengthy nave with its twelve bays, of the choir with its equally numerous arches, and of the well-developed transepts, crowned by the delicate and lofty spire, higher than that of Salisbury, must have presented to the view a singularly impressive *coup-d'œil*. "Crowning," as Dr. Simpson writes, "the summit of the highest hill in the city of London, surrounded by the low houses of the dignified clergy and others, who dwelt under the shadow of the church, with broad gardens sweeping down the hill towards the river, the view could not fail to impress the spectator. There is, in fact, good evidence that its beauty was appreciated, and that those who gazed upon the magnificent building desired to record their impression of its grandeur."

A few drawings of this cathedral church remain in ancient manuscripts. The first we shall mention is a chronicle of the fourteenth century among the treasures of the Archbishop's library, at Lambeth Palace, where a marginal view of the cathedral, drawn with considerable attention to detail, is given in illustration of an account written by the chronicler respecting the taking down, in A.D. 1314, of the cross and ball, with great part of the campanile, because they were decayed and dangerous, and the erection of a new cross and ball, well gilt, and fortified with a collection of divers relics of saints, for the protection of the building. This was done on the 4th of the nones of October. The height of the whole is stated in this manuscript not to exceed 500 *ft.* The marginal sketch shows the great west doorway, the transepts very much compressed, an arcade of five arches running throughout the width of the building, the central tower, with four (here shown in elevation as two) pinnacles at the angles, and the lofty spire, with a large oblate, egg-shaped ball of large proportions, surmounted by a cross. The relics which were replaced in the gilded ball comprised a considerable variety of things, from a piece of the wood of the True Cross, to sundry bones of the 11,000 virgins of Cologne. They were exhibited to the congregation during a Sunday sermon, and afterwards carefully replaced in the ball, not without some sarcasm and scorn on the part of unbelievers, and were the subject of a special service of hallowing on the 6th of May, A.D. 1438, nearly 200 years afterwards. Architecturally, the spire, as drawn in the chronicle, is very curious. There is little doubt that the man who drew it intended to delineate, to the best of his ability, the main features of the actual building as a simple elevation. The exceeding height of the spire and the capacity of the ball greatly impressed the limner, who has depicted his impression of it in a very graphic manner.

Another illustration of St. Paul's Cathedral found by Dr. Simpson in the course of his investigations, and reproduced in the Journal of the British Archæological Association, comes from an early fourteenth-century chronicle of Rochester among the Cottonian manuscripts in the British Museum. Here, in the midst of roof-lines and pinnacles intended generally to represent our city (a description of the foundation of London being given in the text), stands the Cathedral church, drawn somewhat conventionally with arcades and gables, having an exceedingly lofty spire adorned with crockets and circular bosses, and surmounted by a cross and weathercock. In later years several notices are extant referring to the setting up of "the newe wethir cokke." From another manuscript of similar date among the royal collection in the British Museum, is derived a drawing of St. Paul's Cathedral in a very different style of treatment. This occurs also (like the last example) as an illustration to the account of the building of London. In the midst of the general view of London stands an elevated view of the cathedral as seen from the north or south, probably the latter, as there are two pinnacled towers, which appear to belong to the west front, to the left of the central tower. This tower also has pinnacles at its angles and

carries a tolerably high spire, and contains two stories of three long windows to each story. We are indebted to the British Archæological Association for the permission to use these illustrations.

Another view, a coloured drawing, probably the earliest picture in existence representing the City of London, is contained in a fine illuminated manuscript also in the invaluable royal collection in the British Museum. The delicacy of the lines, the charming colours, as brilliant as if freshly painted, the harmonious effect, the almost faultless perspective, and the happy manner in which the artist, a man evidently of no mean powers in his own art, has caught the spirit of the scene, combine to render this beautiful picture a perfect gem of the Mediæval Fine Arts, quite apart from the very great architectural and antiquarian value which it manifestly claims. The Tower of London, London Bridge, and many City churches may be easily distinguished in this picture; above all, in the very heart of the city, stands St. Paul's Cathedral with its central spire, and the way in which this catches the light is indicated very cleverly. Another illustration given by the author of these treatises, is a sketch of the temporary coppings placed upon the ruins of the cathedral after the fire which destroyed it on the 4th of June, 1561. This consumed the spire, and seriously injured the adjacent portions of the edifice, threatening at one time to extend beyond the fabric itself to the Bishop's palace.

The chapter devoted to the personal staff of the cathedral is of considerable usefulness to ecclesiologists, who may gain much information concerning the various dignitaries of the foundation, and their offices. Curiously enough, among the minor canons, twelve in number, were two cardinals, *Cardinales Chori*, an office not found in any other church in England. The duties belonging to their position are not very clearly defined. The chantry priests, a large body, were appointed not only to officiate at the special altars to which they were attached, but they had duties of attendance in choir. Chaucer alludes to the eagerness with which some of the county clergy, to the neglect of their own parishes, fought for chantries in St. Paul's. The ritual and religious services of the cathedral; the care, labour, and forethought required to feed the multitude who derived their sustenance from the cathedral revenues; and many of the aspects which present themselves to thoughtful men like Dr. Simpson, have been treated with care. Occasionally irregular forms of devotion sprang up in the cathedral for a time, like the strange popular devotion to Thomas of Lancaster, in whose honour a short "office," probably intended to be said at his tomb, and a more elaborate "office," with special anthems and hymns, were composed. The British Museum contains a metal plate used in the thirteenth century by the barber who shaved the crowns of the officers of St. Paul's, in order that all who took their tonsures from him might be of uniform cut. The rites of the boy-bishop, with the other usual and unusual

services, supply frequent themes for the pen of a careful writer; and in the chapters devoted to walks around St. Paul's, Dr. Simpson shows considerable knowledge of the topography of the cathedral precincts, and the numerous details which made up the cultus of St. Paul's Cathedral life in the Middle Ages. Notices of Wyclif and the stirring times in which he moved, his appearance before his judges in St. Paul's, in 1377, with the sequel of the tragedy in which the great Reformer played so prominent a part; the Lollards' Tower; the stocks in the dungeon of St. Paul's; the horrid tortures inflicted upon ecclesiastical and judicial prisoners by overbearing prelates and their bloodthirsty assistants; the miserable end of the desperate Peter Burchet, a murderer and apostate, in 1573, the last prisoner in the Lollards' Tower; these and many more episodes which combine to make up the individual and hitherto uncollected history of our metropolitan cathedral and its associations, must be sought for in the interesting volume we have before us.

Of the great fire of 1561, and the disastrous effects which it produced upon the sacred edifice, much has been recorded. Among the many conflagrations which have made havoc with the cathedral, this holds a prominent place. A rare tract, entitled "The True Report of the Burnyng of the Steple and Churche of Poules in London," which is preserved in the Library of the British Museum, and printed by Dr. Simpson, records the most circumstantial details of this calamity. John Stow, also, whose remains have furnished ample store of notes to all who patiently examine them, affords here much new information as to the result of the fire, "whiche was a lamentable syghte and pytyfull remembrance to all people that have ye feare of God before theyr eyes, consyderynge it was ye hous of owre Lord, erectyd to prays hym and pray to hym, ye beawty of ye syte of London, ye beawty of ye holle Reallme. A mynster of suche worthy, stronge, and costly buldynge, so large, so pleasant and delectable, not only of mynstyrs within this realme, but ells where as sure as travayll hathe taughte ws in other realmes ethar Cristyn or hethyn." Paul's Cross and the doings of those who were its denizens furnish other store upon which a most readable chapter is founded, and the book concludes with a sketch of the fortunes of the cathedral during the *interregnum* and its troublous times, when the lopping of the revenues was planned and executed, when the Parliament treated the bishops and their clergy with high-handed dealings, drove out the prebendaries, and replaced them with trimmers and place-hunters, dispersed the plate, stopped the necessary repairs, suspended the works, and allowed desolation and desecration to work their natural way with all that had been rich and beautiful and sacred hitherto. Eloquent words, which will bear quotation, ring upon our ears as we close Dr. Simpson's book. They will bear quotation here:—"Many another grand cathedral had the same sad tale to tell; the same wearisome story of pluralities and non-residence, of overwhelming greediness and self-seeking, of rampant nepotism, of desecrated naves, and of deserted choirs; of dignitaries receiving great revenues and rendering no service in return,—of cold hearts. The way was paved for still greater desecrations, and they came. Horses neighed in the canons' stalls; and Dr. Cornelius Burges, with his twenty thousand pounds of plunder, preached in the ruined choir. We may not conclude with words of sadness. Nor is there need. The renewed life of the cathedrals is one of the most striking features of the great religious revival of our day. St. Paul's has abundantly shared in that regeneration, and let the reverent thousands gathered in its vast area, its long-drawn nave, its spacious transepts, filling every part, silent, listening eagerly, last dedication festival to the grand music of Mendelssohn's 'St. Paul,' remind us that the cathedral is something more than 'a petrifaction of religion.'" Works like these, which we have brought before our readers on this occasion, are not without their use in fostering the reverential feelings we should all exhibit towards so historic a pile as the cathedral of St. Paul.

The Plane Tree at South Kensington Museum.—Mr. Smiles pleads for the preservation of "the magnificent plane-tree in front of the old entrance-door of the South Kensington Museum," which, he says, is about to be sacrificed to make room for certain new buildings.

THE NEW FRENCH SYSTEM FOR THE CONSTRUCTION OF HOSPITALS.

THE effort to substitute small isolated structures as hospitals for the monumental buildings of the past, has at last received in France practical sanction as well as theoretical support. In spite of the antagonism of private interests and the force of routine, the new system has been adopted for military and civil purposes at St. Denis, at Courbevoie, by the Paris Municipal Council, by the Eighth Army Corps at Bourges, at Autun, at Cosne, Macon, Montpellier, &c. The idea of isolated small structures of only one story instead of large hospitals was first advocated in France by M. Le Roy, in a paper submitted to the Royal Academy of Sciences in 1777. The first application on a large scale of this principle was during the Crimean War, when in some instances the patients were separated as much as possible. The experiences during the war of Secession and during the Franco-Prussian War clearly demonstrated the advantage of tent and cottage hospitals. The deaths after surgical operations in these hospitals during the American War amounted to 34 per cent., while during the Crimean War in the old-fashioned hospitals the French lost 74·8 per cent. of the soldiers who had undergone surgical operations.

The method of construction which is now generally adopted in France, wherever the new principle is admitted, is known as the système Tollet, and was patented by M. Tollet, a distinguished engineer, Knight of the Legion of Honour, &c. This gentlemen has sought to build in harmony with the laws of hygiene rather than merely in keeping with some special school of design; he has realised that the object of a hospital is not to ornament a town, but to cure its inhabitants; that its sanitary qualities are far more important than its monumental appearance. We need not trace the well-known arguments which would lead a person actuated by these principles to propose small cottages or pavilions standing well apart and surrounded by free currents of air, for the re-introduction of which the *Builder*, in the first instance, did so much; but it is essential to inquire in what the Tollet system differs from the English cottage hospitals or the wooden huts of the American Civil War.

The first important difference is in the form adopted. The great object was to expose as large a surface as possible of the hospital to the purifying influence of the external air, and as little as possible to the contaminating influence of the internal air. For this purpose cross-beams, angles, ceilings, and numerous floors, garrets, and staircases should be avoided where practicable. A vaulted roof would not present the same multiplicity of angles as a flat roof or ceiling, where the corners cannot be readily reached by the currents of air and by the scrubbing-brush. But the choice of the right curve was a puzzling problem. The full-centre arch, the circular arch, the ellipse, the depressed arch, would all give a curve that is too flat in the upper part and too vertical in the inferior half. This would make the introduction of a "matlass" of air of even thickness a matter of some difficulty, and also the traction would necessitate the placing of rafters across the vaulted roof to prevent the spread. But rafters would not only increase the cost of the structure, but also the amount of material employed and capable of absorbing injurious emanations and of harbouring dust and dirt, while reducing by their presence the space for air in the wards. All these objections led to the ultimate adoption of the ogival or pointed arch. The frame-work of the hospital is made of iron girders or ribs, placed at a distance of 4 ft. from each other, meeting at the point of the arch. The peculiar shape of the girder gives the iron double the resisting power it would otherwise possess; and, this being the case, it does not matter of what substance the wall is made, so far as its durability, or rather its strength, is concerned. For field ambulances the intervening space is filled up with wooden planks, which can be burnt each time there is a change of quarters, thus reducing the chances of infection and the weight of the materials to follow in the wake of the army, both these advantages being of the greatest importance.

Where the hospital is to be of a more permanent character, bricks or stones are used. The most important hospital of this description is that of Bourges, which holds 220 beds. It is situated on a gentle slope, and covers six hectares and fifty ares of ground (about fifteen acres). This is equivalent to 2,582 square feet of land per bed, whereas the new Hôtel Dieu of Paris will only give 386 square feet of land per bed if it is to hold 600 beds, and 290 square ft. if the full complement is to be 800 beds. The Bourges Hospital consists of twelve one-floor ogival pavilions erected at a distance of 52 ft. from each other, the principle being that the intervening space of open air or garden should be twice as wide as the structures are high. These pavilions are divided into two rows, and the garden separating the one row from the other is about 164 ft. wide, while the amphitheatre, dead-house, &c., are erected at a still greater distance. The pavilions measure 120 ft. in length by 26 ft. in width, and are raised about 5 ft. above the earth. They contain twenty-eight beds, nearly 4 ft. being allowed between each bed, and more than 9 ft. between the two rows of beds. Altogether each individual has 57 cubic mètres of space, though in the American hospitals the space allowed barely exceeded 40 cubic mètres, and 27 cubic mètres were considered the minimum.

The outer surface of the wall of this structure is allowed to retain its porous character, as pure air only plays upon it. Between the vaulted roof and the outside covering of tiles there is a "matlass" of air 8 in. wide, and the bricks employed for the wall are perforated, so that a current of air passing within the wall excludes the damp and modifies the excess of cold or of heat. The inner surface of the wall is covered with silicate, so that it is rendered smooth and non-porous; it can, therefore, be washed with an antiseptic solution, or, better still, it may be daubed over with petroleum and scorched by its flame. The building is made exclusively of non-combustible materials, and vapours condense on the walls, run down the side, but do not sink into the pores, where the organic matter is prone to ferment. The floor at Bourges is made according to the Gourguechon patent, of wood thoroughly covered with a bituminous substance, so that the hospital dust cannot sink in,—an important consideration when we remember that this dust has sometimes been found on analysis to contain 34 per cent. of organic matter.

One of the leading advantages of the ogival form is the facility it affords for the complete ventilation of the hospital. In winter the warmed air naturally rises to the point of the arched roof, where there is a ridge that can be opened running along the entire length of the pavilion, and communicating with cowls placed at short distances one from the other, which draw off the air when the ridges are closed. There are numerous large windows on both sides of the pavilion, and above them small louvre windows, that can be readily opened by a rope. The doors at each end of the pavilion are surmounted by a rosace, that helps to ventilate in a longitudinal direction whenever the course pursued by the wind renders lateral ventilation not so advantageous. The ridge at the point of the arch is 4 in. broad, runs the whole length of the building, and is divided into sections of about 15 ft. each. One or all of these sections can be opened by means of ropes, thus allowing an outlet for the vitiated air at the apex of the arch, where it would naturally ascend. The air is admitted by small apertures pierced both below the beds and at some elevation above them, and is drawn in by the heat of the stove in winter. A space of 5 ft. underneath the floor of the pavilion also admits of all manner of experiments in respect of ventilation, as here the air can be collected, cooled or warmed, moisture added, or it can be charged with medicated vapours.

At the end of the pavilion, facing the entrance, there is a door that communicates with a little annexe, which is severed from the main building by a covered passage, open on both sides, and about 9 ft. long. Here are the closets, communicating with a tub placed in the open air immediately below. The sides of the tub are provided with a spongy substance, soaked with a disinfectant, so that the matter received is at once purified. Near to the tub, and also in the open air, under this annexe, is a little cart, which receives from above the soiled linen, so that it is at once removed from within the walls of the hospital. The main building, or pavilion, apart from the dormitory with its twenty-eight beds, contains on each side, on entering, a small separate room, the one for the nurse, the second for any patient it might be desirable to keep isolated. At the other end of the ward there is a small dining or sitting-room, a bath-room, and a small kitchen for making poultices, &c. Such is the Tollet Hospital at Bourges. Each of the

pavilions is like its neighbour, excepting the pavilion not built for the patients, but for the administration offices, pharmacy, kitchen, &c. With some slight modifications the same system has been adopted throughout. There now remains to be seen what sanitary and financial advantages have been achieved.

It is easy to perceive that the main features of the Tollet system are susceptible of a very wide application. There is even a Swedish church built in Paris according to these principles, and its application for stables naturally suggests itself. There are Tollet stables for the French cavalry, but the new method of construction has been most extensively applied in the building of barracks. The sanitary results realised by the Tollet barracks will explain their great popularity. At Bourges there are barracks on the Tollet system for 1,471 men of the 37th regiment of artillery, where the mortality amounted to 7·6 per 1,000 in 1876, instead of 11·88 per 1,000, the average mortality of this branch of the service during the year in question. In 1877 the deaths were 5·43 for the Tollet barracks, and 10·50 for the other artillery barracks. At Bourges in 1876, there were 468 cases of illness per 1,000 artillerymen, and in 1877 only 428, whereas the proportions per 1,000 for the two years in the other barracks were 552 and 506 per 1,000. At Autun, there are infantry barracks on the Tollet system for 844 men, and at Cosne for 745 infantry. In 1876, the average illness of the French infantry amounted to 528 cases per 1,000 soldiers, but this was reduced at Autun to 136 cases, and at Cosne to the singularly small number of 22 cases per 1,000. During the following year the average sickness of the infantry amounted to 482 cases per 1,000, but at Autun there were only 111 cases per 1,000, and at Cosne 71 per 1,000, and no deaths at either place. Of course it is unfortunate that as yet we have only statistics for two years, still they are sufficiently emphatic to leave but little room for doubt as to the good achieved; nor had any case of typhoid fever occurred in any of the Tollet barracks, though this disease has been very prevalent among the French troops; indeed, the 95th regiment of the line was recently quartered at Bourges, one battalion in the old-fashioned barracks of St. Sulpice, another in the barracks du Grand Séminaire, and the two remaining battalions in the new pavilion or Tollet barracks of Séraucourt. In a short time typhoid fever broke out in both the old barracks; there were thirty cases, and no fewer than eighteen deaths. The twenty pavilions of the Tollet system were within a hundred paces of one of the old barracks, and the soldiers who inhabited them were of the same regiment, and yet not a single case of typhoid occurred among these men!

With respect to diseases of the respiratory organs, the statistics are equally satisfactory. During the two years 1876-77, the number of cases were only equal to 20 per 1,000 at Bourges, Cosne, and Autun, whereas at Dijon and Nevers, where the climatic influences are the same, the proportion was 40 in the 1,000. The diseases of the respiratory organs are most frequent among the regiments quartered in the high lands of the Rhone, the Alps, the Dauphiné, and Savoy. In these districts the statistics show 54 cases per 1,000. With the 13th Army Corps in Auvergne, the figures are also 54 per 1,000; with the 11th Corps in Brittany, 50 per 1,000; with the 12th Corps in Limousin, 50 per 1,000. The minimum is with the 17th Corps, namely, 31 per 1,000, and the 8th Corps, occupying the Bourges district, 32 per 1,000; while in the Tollet barracks the proportion is, we repeat, 20 per 1,000. These few figures will suffice to show what important results have been attained, though much more might be said on the subject.

While the reform in the construction of hospitals and barracks has thus ensured a great saving in the life and health of the French soldier, it has been equally beneficent to the pocket of the French taxpayer. The hospital at Bourges was designed for 320 patients, and would have cost 112*l.* per bed. But when the works had begun, the scheme was altered, and the number of beds reduced to 220; this caused a considerable increase in the proportionate expense, and the hospital actually cost 144*l.* per bed. The cheapest French hospital is estimated at 180*l.* per bed, with 40 instead of 57 cubic mètres of space for each patient; but the cost per bed amounted at Lariboisière to 720*l.*, at Ménilmontant to 640*l.*, and at the Hôtel Dieu to the fabulous price of 2,400*l.*! In the construction of barracks, according to the new system, we are promised an economy of, at least, about 30 per cent.

Under these circumstances it is not surprising that the proposed reforms should have found many warm advocates, and achieved some notable theoretical as well as practical successes. The most recent achievement has been the conversion of the Paris Municipal Council. The necessity of increased hospital accommodation in Paris has long been felt, and the Municipal Council have finally voted a sum of 17,600*l.* for the construction of a hospital according to the Tollet method at St. Ouen. The municipalities of Courbevoie and St. Denis, near Paris, are now constructing hospitals according to the same system. Havre has a similar project in consideration. At Montpellier it was decided to abandon the old central hospital where the *clinique* of the university was held, and to build a Tollet hospital in the outskirts of the town. The same system has been adopted for the engineer barracks at the fort of Cormeilles, for the cavalry and infantry at Macon, for the artillery at the fort of Langres, &c.

Abroad the Tollet system has been adopted for the Austrian army, and almost every European power has sent special commissioners to visit Bourges and report on the innovation. In this respect, the Danes and the Russians have been particularly active. The Grand Duke Constantine, in person, conducted the inquiry, and has had many lengthy interviews with M. Tollet. The time has, therefore, come when English sanitary reformers should take further note of what is occurring among our neighbours in this very intricate and important question.*

ABSTRACT OF THE CENSUS LAID BEFORE PARLIAMENT.

THE preliminary Abstract of the Census, of which we gave our readers some forecast in a recent number, has been laid before Parliament. In our notices of any statistical papers which so directly affect the prospect of the trades connected with building, it is our object to present our readers with such deductions as we may ourselves work out, as likely to be of value from the *Builder's* point of view, rather than to repeat those details which are to be found in the daily papers. The form in which a statistical paper is presented to Parliament naturally determines, for the most part, the tone and bearing of the remarks which it elicits from the press. When the report is crude and raw, remarks are vague and general. In the present case the Registrar-General has himself provided an analysis of his report, giving ratios and percentages, and enriching, or at least augmenting, the English language by a new word to express the relation of area to population. At all events, we do not find the word "areality" in the English dictionary.

The sum total of the great addition may be conveniently regarded under the following heads:—

	1881.	Per cent.	1871.
England and Wales.....	25,968,286 ...	73·78 ...	22,702,268
Scotland.....	3,734,370 ...	10·60 ...	3,360,378
Ireland	5,159,839 ...	14·69*...	5,412,377
Islands.....	141,223 ...	·50 ...	—
Army and Navy abroad	242,844 ...	·70 ...	—
Total	35,246,562 ...		... 31,845,379

* Decrease.

As to the distribution of this large number of human beings, with regard to the area of land in the several main divisions above indicated, it may be convenient, first, to state the acreage. This we have given at

	Acres.
England.....	32,590,397
Wales.....	4,734,436
Scotland.....	19,639,377
Ireland	20,322,641
United Kingdom.....	77,286,991

The proportion between population and area is calculated in two ways. The simplest of these, as dealing with the roundest numbers, is stated in units of population per square mile of country. The other method, which the Registrar-General describes by the word "areality," is stated in yards, or acres and fractions of an acre, per unit. The density of the population of England and Wales is now about 440 persons to the square mile, or ·625 to the statute acre. At the census of 1871 the density was, according to the Registrar-General, 390 persons per square mile (our own figures give 384); the increase on the decade being at the rate of 50 persons per square mile, or 12·83 per cent. The "areality," also given by the Registrar-General, was 19,934 square yards to each person in 1801; 7,928 square yards to each person in 1871, and 6,955 square yards, or 1·437 acres, to each person in 1881. With this increase of density (not for the United Kingdom, of which we spoke on a previous occasion, but) for England and Wales, has to be contrasted the decrease of density in Ireland, from 258 souls per square mile in 1841, and from 174 souls per mile in 1871, to 162 souls per square mile in 1881.

With regard to the primary division of the population, namely, that according to sex, if we confine ourselves to proportions per cent., they will be found to be 51 per cent. of females, to 49 per cent. of males, the proportion being the same for the United Kingdom, and for England and Wales. This shows an increase in the proportionate number of females since the beginning of the century, when the ratio was 50·6 females to 49·4 males. The difference is not very large; but it is deserving of remark as connected with the recent movement made as to female education and employment. Moreover, in dealing with such large numbers, the transfer of even four *per mille* from one side of the account to the other shows an additional preponderance of females over males, as compared to the ratio existing in 1801, of more than 280,000 souls.

The Registrar-General has given the percentage increases during the century, in the same manner as that in which, in a previous article, we ourselves had calculated them for London alone. They are as follow:—

	Per cent.
1801 to 1811	13·99
1811 to 1821	14·83
1821 to 1831	14·67
1831 to 1841	10·09
1841 to 1851	2·54
1851 to 1861	5·72
1861 to 1871	8·62
1871 to 1881	10·68

Thus as far as the ratio of increase on the population can be taken as a test of prosperity, the country is now in the same condition as in the decade 1831 to 1841. It should be remarked, however, that it was in this decade that the railway system was introduced. The effects could hardly be distinctly perceived by 1841; but by 1845 the great prosperity of the earliest lines had produced the well-remembered railway mania. In spite of the stimulus thus given to the productive force of the country, we find, however, that this very decade was marked by the lowest rate of increase during the century. This fact has to be looked in the face. It is not alone among these data which serve to show that marriages, or, at all events, prolific unions, do not increase with the increase of the material prosperity of a country. We are not offering any opinion on that vexed question. But we call serious attention to the comparision above indicated. It is a remarkable coincidence that on the very day on which the above lines were written, a telegram from Berlin in a morning paper says,—"The authorities, who have been considering the cause of the decline of commerce and industry, are inclined to attribute it to over-population, which is becoming manifest at an alarming rate, and is entirely out of proportion to the augmentation of agricultural products." The subject is one of the highest social interest, and is one on which hasty generalisation, from insufficient data, is mischievous. When we contrast the two most densely-populated English counties, viz., extra-metropolitan Middlesex, with 1,364 souls to the square mile, and Lancashire, with 1,707 souls per square mile, hives of industry and cradles of wealth, with the 162 souls per square mile of Ireland,—the word over-population has a curious inconsistency. Important as the proportion between the agricultural produce of a district and the population which inhabits it must be, it is evident that it cannot be regarded alone as a measure of the proper distribution of population. As to that, indeed, the controlling feature must be the military or naval *status* of the district in question, or the ability of the people in time of war to command the uninterrupted access of such supplies of food as they desire from abroad. Bristling as the world is with arms, while the dull sound of cannon is now echoing from the shores of the Mediterranean, there is only too much reason for reflecting with anxiety on the foregoing consideration. A dense and a rapidly-increasing popula-

* In connexion with this subject reference may be made to our illustrated account of the Sturges Pavilion, Belle Vue Hospital, New York,—vol. xl., p. 68, &c.

tion is a feature of which the value depends upon the co-efficient,—to borrow a metaphor from algebra. With wisely-directed industry, every fresh arm added to the army of labour is a source of natural wealth. In the absence of wisely-directed industry we have to regard, not so much the increased number of arms, as the increased number of mouths. When a man cannot do something more than feed two and a half human beings by his labour, human beings are, economically regarded, but noxious weeds. When he can and does endeavour to feed four, six, ten, or more of his fellows, every man is like a ripe ear of corn added to a well-filled sheaf.

SANITARY AND SOCIAL ASPECT AND PROSPECT IN DUBLIN.

IN continuation of our notes on some of the sanitary, social, and other aspects of Dublin, let us observe here that our views are not the result of impressions from hurried visits through the city and environs, but of repeated inspection and inquiry in each locality. Progress or decay in the life of a city, to estimate it aright, needs a retrospective as well as a present survey. It needs also that the investigator should have some previous personal knowledge of the places and habits he describes extending over a number of years, so that he may draw just comparisons. Antecedent labour in the above direction, we believe, entitles us to speak: so we will proceed with our notes. In almost every quarter of the city proper, large areas are met with characterised by visible evidences of decay,—dilapidation in respect of buildings, uncleansed and badly-cared for streets, indigence among the industrial classes through scant employment, and a desperate struggle for life among large numbers of the small shopkeeping class. This decay is creeping on like a cancer, and it is now skirting and hedging in the very Viceregal and municipal centres of the city, affording a sad contrast with the pictures presented by those parts of the city fifty years ago, or even less. Castle-street, adjoining the Castle of Dublin, the Lord Lieutenant's official residence, for two centuries was one of the chief commercial centres of Dublin. Indeed, from the days of Charles II. down to the end of the first half of the present century, Castle-street maintained its importance, and ranked at the head of the old streets of the city on the south side of the Liffey. Since about 1850 this locality has been going down; its wealthy traders deserted it years ago, and most of the houses and shops are in a ruinous condition. If we were to plant the Mansion House of London, the Royal Exchange, and the Bank of England in the middle of the old Seven Dials or Drury-lane quarter, the contrast would be scarcely more marked than that presented by the picture of some of the surroundings of the Castle of Dublin to-day, as compared with its position forty years ago. Dame-street, leading direct from Trinity College to the Castle, still, to a great extent, maintains its importance as a great artery, and has many good buildings; but as it approaches nearer to the City Hall (formerly the Royal Exchange of Dublin) and the Castle, the appearance of several of its old brick buildings spells decay. Parliament-street, too, a comparatively modern street, facing the old Royal Exchange, and leading up Cork-hill to the viceregal centre, is evidencing a marked decay in the appearance of its houses and shops, compared with what was apparent some years ago. We particularly noted the streets named, because for many years those and others leading directly from them have been looked upon as comprising the most wealthy and stirring business portion of the city. Decay at the extremities of a city, like disease at the extremities of the human body, may be arrested by timely remedies; but when disease begins to encroach on a central and vital spot, there is reason to feel alarmed. Municipally, Dublin for many years lacked skilful and intelligent treatment in an improving and sanitary direction. Her black spots were ignored and persistently neglected, till the sores and ulcers of her lower social strata reached her most central and vital parts, spreading by what they fed upon. Thus, in Dublin, tenemental life and living are surging around the most fashionable portions of the city, and threaten to absorb the few remaining haunts of wealth and private and public importance. Reconstruction is a part of the yearly work of every modern city; but in all well-governed cities the work of renewal or improvement need only be carried out by instalments. Unfortunately, in Dublin the measure of her wants is great, for by long-continued neglect wholesale demolitions are at present necessary, and large measures of improvement, building and sanitary, should follow in their wake. That such measures of improvement are requisite for Dublin we believe her own sanitary authorities will not deny; but we are not sanguine that any great scheme of public improvement will be carried out in the Irish capital within a reasonable time. The corporation is constantly pleading a want of funds, and no doubt with a larger income it could do more; but it has not hitherto wisely or economically used the income arising from the city estate nor the loans obtained through its borrowing powers. By the falling in of leases, as well as through other changes, the municipal income is becoming yearly more large, but small measures of improvement are counteracted in their effect in Dublin by the steady growth of large areas of poverty and decay, and the ills incidental thereto. The annexation of the immediate township suburban districts north and particularly south of the city, now ruled by distinct local boards, is now desired by the Corporation. A large number of the inhabitants of the suburban townships derive their income, of course, through city business, shops, offices, and appointments. It is considered that the township residents derive all the advantages belonging to the city, but contribute little or nothing towards its maintenance by contributing to the rates, &c. The municipal body calculate that by the absorption of the townships and the necessary extension of the municipal boundary, it will be then enabled, through its greatly increased income, to carry out those large measures of sanitary and town improvements which Dublin needs and which cannot be attempted under the present financial circumstances of the Corporation. A Boundary Commission sat in Dublin not many weeks since, and after hearing a lot of evidence on the part of the Corporation and the opposing boards, declared in favour of the annexation of the immediate townships. This, of course, strengthens the action of the Corporation, but considerable work need be done yet before the annexation scheme can be carried out. A more widely extended municipal boundary means a larger city, considerably more work, and many new appointments, and their sequence, much greater expenditure. If the Corporation of Dublin succeeds, we hope, for the sake of the public health and the other sanitary and urgent wants of the city, it may prove worthy of its trust, but with the present glaring defects of its constitution and administration before us we, have our misgivings.

That the Corporation are entitled of late to praise for some useful work done in a building and sanitary direction we will not deny; but when all is stated, it is miserably small in view of the wants of the city. Among recent works the rebuilding and widening of Carlisle Bridge is a decided improvement, though long delayed. The new swivel bridge lower down over the Liffey is also a great acquisition, but the Port and Docks Board played the chief part in carrying out these very efficiently-executed works, which it is but justice to say reflect credit on the contractor employed. On the south side the new swivel bridge requires a wide approach to afford better facilities for the vehicular traffic. A new and wide street is contemplated, and is positively needed, and it should be made as a continuation of College-street, crossing the end of Townsend-street, and then curving gradually round to a straight approach to the new bridge. Between the lines of Great Brunswick-street and George's and Sir John Rogerson's Quays, there is a large area of ruinous and unsanitary dwellings, narrow and badly-kept streets and courts, much uncleanliness, and an absence of wholesome ventilation. Opening-up is badly needed in the locality, and this can be accomplished by the demolition of a description of tenemental houses that should have been improved off the face of the earth years ago. This work of improvement might be carried out by instalments, and immediately follow the opening of the approach to the new bridge, which will cut across the end of the neglected locality we have indicated.

One of the most marked improvements effected within recent years in Dublin is the work carried out by the Dublin Port and Docks Board, in deepening the navigable channel of the river and harbour, reconstructing the quay walls in the shipping portion of the Liffey, and extending the line of the North Wall quay a considerable distance seaward. The latter work is still proceeding. More and better dock accommodation is also being provided at the end of the North Wall. Large sailing-vessels and cross channel steamers can now come and go independent of the tides. With the improvements now being effected in the river and harbour, we may soon expect to see the Royal Mail steamers running directly up to the quays of Dublin instead of to Kingstown harbour. The change would expedite the service.

Street and other subsidiary improvements in the city proper move at a painfully and depressingly slow pace. New streets projected by the Old Wide Street Commissioners, before that body was dissolved upwards of forty years ago, are still unopened. The Wide Street Commissioners, during their existence, carried out several notable public improvements in Dublin in an efficient manner, but the "Reformed" Municipal body, which succeeded to the duties of the former body, have not signalised their tenure of office by any street improvements or opening-up within the city worth speaking of. The new street for opening up Cork-hill and Castle-street to Christ Church Cathedral, lately restored, though urgently needed, has been hanging fire these twenty years, to the great scandal of the city. We marvel much the Irish Executive has not taken some steps to expedite the improvement, for, as we have already remarked, the ruin and wretchedness that exist under the very shadow of the Castle are of a very marked character, and present a very uncomfortable background to the viceregal centre. A new street in continuation of York-street to St. Patrick's Cathedral was contemplated sixty years since, but was never carried out. With the improvement of St. Stephen's-green completed a few months since by the liberality of Lord Ardilaun (late Sir Arthur Guinness), the opening of this new street leading direct from the green to the cathedral would be a decided acquisition to the city, and a great benefit to the interests of the cathedral. The opening up of several districts in the old quarters of the south side of the city, and in the north-western old quarters north of the Liffey, is absolutely needed for the health of the inhabitants and as a judicious step in arresting the progress of rapid decay going on in those parts of the town. We regret to note that St. Patrick's Cathedral, which was restored about sixteen years since by the munificence of Lord Ardilaun's father (Sir Benjamin Lee Guinness), is suffering already and in a serious way from damp and rot. The floor of the church is very low, and much under the level of the street without; and, to make matters worse, the bed of the old Poddle River (now and for long years a covered-over and elongated sewer) passes under it in close proximity to the walls of the cathedral. As no special funds exist for providing for the repairs that are now needed, a public appeal has been made.

As regards the drainage and sewerage of Dublin, many defects are still unremedied. The Corporation within recent years constructed by instalments several miles of new sewers, but many more are needed, and long lengths of those recently constructed are very defective in junction and gradient. The old stone house drains in Dublin in general are wretchedly bad; many act and many more do not. Some of these house-drains directly enter the street sewer unprovided with any kind of trap, and in streets where the house-drains are trapped it will be found the traps are very defective, faulty in construction, or out of repair. In fact, in thousands of the houses of Dublin there is a direct communication between the interior of the house and the street sewers, and the gases may be sucked or circulated backward and forward as draught, temperature, or other circumstances accommodate. The latest complement of sewer work carried out by the Corporation a few months ago has been already the subject of two inquiries and reports as to alleged defects and scamped workmanship. Several defects have been proved, others have not been proved. The old system of privies and ashpits or cesspools still obtains in Dublin to a very large extent, and their state in connexion with tenement-houses is truly deplorable and sickening. The old tenement-houses have mostly large and open ashpits communicating with the privies. Being uncovered, they receive the rain, and are otherwise acted upon by the heat in warm weather, resulting in dangerous effluvia. The sanitary authorities are endeavouring to lead to

the substitution of water-closets, and in some quarters have succeeded. Until an entire change of system takes place, ill health and other evils will be inseparable from these old tenemental dwellings. In the meantime, the old ashpits should be reduced in size, and enclosed. Frequent cleaning is a necessity, but where large ashpits and cesspools exist the cleansing is at long intervals, thereby adding to the danger that necessarily accompanies filthy surroundings. The street scavenging of Dublin is very limited and imperfect in its range, and no regular system of domestic scavenging at all exists, though such a system has been long in contemplation by the Corporation. The refuse receptacles of the houses of the poor, and their back-yards, with the lanes and courts where they reside in large numbers, should be cleaned often, and the latter daily. The subsoil of large areas of Dublin, covered by tenemental houses, is saturated by leakage and percolation, and has been so for long years. Health and a low death-rate are impossible under such conditions as we have described. The Liffey purification and a judicious system of main drainage suited to the circumstances of the city are still in abeyance, and little progress seems to be made in expediting the beginning of the necessary works.

We long since indicated what ought to be done. If the sewage of the city is not utilised for irrigation, reclamation, and agricultural purposes, but sent out to sea, much valuable fertilising material will be lost. If it be sent out to sea, there seems to us to be only one practical and efficient plan for an outfall whereby the sewage could be got rid off without the danger of its drifting back again in part into the harbour and river. For the north city and suburbs the outfall should be outside the Head of Howth, and for the south city and environs the outfall should be outside Dalkey Head. These two outfalls, of course, will necessitate long lines of outfall sewers, but the suburban townships on either side of the bay are extending rapidly, and their wants and the wants of the future will need to be provided for. It is manifestly clear that the sewage of Dublin cannot be poured into the harbour; and as it cannot, the other plan must be adopted if safety and efficiency are to be secured.

The building trade and cognate industries have not been brisk of late in Dublin, though a limited number of suburban villas are being erected in the northern and southern suburbs. Want of employment is apparent in various trades. The Corporation is erecting a public abattoir in the north-western end of the city, and it is to be hoped that the sanitary authorities will compel the butchers to use this necessary building, for the majority of the present private slaughter-houses are a positive disgrace and danger to the city. Another abattoir will be needed for the south side of the city. The cost of the new abattoir is estimated at 15,000*l*. The approach to the new swivel bridge on the south side on the plan intended by the Corporation is put down at 20,000*l*. If the very old and wretched dwellings we previously alluded to in the vicinity of the new swivel bridge are cleared away in opening the new approach, the improvement will be a real one. An improvement has lately taken place in the condition of the dairy-yards of the city by a system of supervision; but much remains to be accomplished before the dairies, cow-sheds, and milk-shops of Dublin can stand the test of a fair inspection. Public baths and washhouses have long been needed, and a loan is being sought by the Corporation for providing some. The old markets of Dublin have long become unfit, both structurally and on sanitary grounds. Indeed, the butchers deserted some of them years ago, and spread themselves over the city, many of them converting their back-yards into slaughter-houses. An extensive new market has just been completed in South Great Georges-street, called the South City Market, erected by a public company. To all appearance, it is suited for its purpose; but whether the public will take to it, so that it may prove a success, it is difficult to say. The old city or parochial graveyards in connexion with the churches are in most instances demoralising pictures of unchristian and unsanitary neglect. In summer they are pathless with rank vegetation, and in winter dismal with decay and rottenness. Surely several of them with little cost could be converted into ornamental gardens and health-spaces for the poor populations that surround most of them. The weak point of municipal administration in Dublin is procrastination and the want of decision. The Corporation has secured several useful Acts, and issued from time to time a number of unexceptionable rules and regulations; but, alas! it has not enforced them for various reasons well known to itself and others. Its recently-confirmed "Building By-laws and Regulations" are already almost a dead letter, and thus speculative building irregularities are rife, and some of the wrong-doers are members of the Public Health Committee. In other directions the same fatal policy is pursued by the municipal body. The sanitary defects of Dublin are many, and her wants great, but we could not cover them all in a paper or two. We have endeavoured to truthfully describe the aspects of the city as we found them and as they exist at the present hour. If much drunkenness, poverty, and crime is evidenced, a large amount of it may be truly put down to the wretched state of the homes of the people. Long years of sanitary and other neglect have borne their fruits, and the dismal harvest is being reaped in a continuously and abnormally high death-rate, and the chronic ills that doom a large number of the poorest of the population to vegetate or drag out their lives in a kind of living death.

A FRENCH CRITIC ON ENGLISH ARTISTS.

FEW French art-critics who have expressed their opinion of foreign—especially of English—art, have been in the habit of exercising the complimentary tone for which Frenchmen in the old days were proverbially famous, and it has very often happened that the expression has been so mixed up with evidence of want of care in obtaining a knowledge of the simple facts, that those who have read their remarks have scarcely regarded them as worth any serious attention. Some years ago, however slightly English artists were acquainted with French art, French artists were altogether unacquainted with, and not in the smallest degree anxious to know anything of, English art; but, of late years, a very different feeling has existed both in England and France, and especially with the landscape-painters the story has been often told how much French landscapists have learnt from our great English masters. We have not unfrequently had occasion to smile at the complacent criticisms of French visitors to our London exhibitions. It is not often that we find remarks so unprejudiced and thoughtful as those which have appeared in the June number of the *Gazette des Beaux-Arts*, and we are led to quote at some length the remarks of M. Duret on the two exhibitions of the Royal Academy and the Grosvenor Gallery.

Of course, we in England understand the worth of M. Duret's statement that by the mutual situation of our two London exhibitions "the terror which weighs on certain French painters of being refused at the *Salon*, and thus strangled, is unknown to the English artist;" but we strongly suspect that French readers of the *Gazette des Beaux-Arts*, unacquainted with the details of our Academy system, will be somewhat misled by such a picture of artistic bliss. Of the representatives of "classic art," Sir Frederick Leighton and Mr. Poynter, our critic has not much to say; they occupy in our school, he remarks, relatively the position held in France by M. Cabanel and M. Bouguereau. In his estimate of the President of the Royal Academy, M. Duret is not enthusiastic; he considers, however, all praise is due to an artist whose endeavour is to impregnate the old traditional forms with a new spirit. Of Mr. Poynter's work our critic is evidently no admirer. To Mr. Millais and Mr. Watts, he next turns his attention, and his remarks, while in themselves open to criticism, merit at least examination. Our critic fully assents to the position Mr. Millais occupies on the score of the wonderful series of works he has produced, "but," he continues, "the infatuation of the public surpasses all bounds, when it seeks to place him absolutely without a rival, to make of him a great master."

This view of a French critic is explainable. It is difficult for the English critic to appreciate the reputation of painters who hold in France an equivalent position to that of Millais, such painters as Baudry or Carolus Duran; they, we suppose, however, are as thoroughly national in their spirit, as Millais is English; hence, we imagine, the mutual misunderstanding, though we suspect that the future, which will judge the question in a completely unbiassed manner, will decide without hesitation in favour of the English painter. Our French critic recalls in warm terms the work of Mr. Millais in his pre-Raffaellite days, and contrasts with its careful, forcible, expressive character, the work the painter now exhibits, "hastily produced with the least possible amount of previous reflection, approaching manufacture"; and, after some severe remarks on the interesting series of exhibits with which Mr. Millais has been lately delighting the public, says, "when we recall the old pictures, bold and vigorous, that Millais painted, and see what he produces now, we feel inclined to say, 'Paint us, as formerly, the pictures in which you sought to please yourself and not the public.'" We only regret that M. Duret, as a Frenchman, finds nothing more to say in praise of a painter who, like Millais, in spite of having been so long a favourite, continues to paint so nobly; far less success gained by an artist on the other side of the Channel would have long since spoilt and ruined his productive powers; it is, indeed, given alone to the favoured few, in art especially, to withstand the fatal effects of what is understood by success.

Mr. Watts is the next artist to whom our French critic turns his attention, and very complimentary are his studied remarks on that cultivated artist. Mr. Watts's technical difficulties of execution and uncertainty as to methods, in our critic's view, are, however, easily traceable in the painter's work: "While his broad and simple drawing has remained throughout constantly the same, his processes of painting have frequently varied. The want of success that has followed some of his works," remarks M. Duret, "is due to the fact that each time he is face to face with his model, he sincerely endeavours to place it as living as possible on his canvas; it is only those who have created themselves a conventional manner once for all, who accustom themselves to a process, and are contented with a mean, who never excel themselves and never feel deceived."

Mr. Whistler, to whom a few words are devoted, is, we might observe to M. Duret, scarcely an English artist. The remarks on Mr. Albert Moore, though somewhat severe, will, we suspect, be in accordance with the opinions of not a few readers. Admirers of the school of which Mr. Dante Rossetti was the founder, and of which Mr. Burne Jones was once the humble follower and now is the high priest, will read with interest the remarks of a foreign critic on this peculiar phase of English modern art; but on the sickliness of some of its productions,—and Professor Richmond's work comes in for a share of reprobation,—our French critic is quite as severe in his remarks as are some of his brethren on this side of the Channel.

Here M. Duret stops his criticism,—and we have mentioned all the names to which he has devoted any notice,—having exhausted, so he tells us, the "list of English painters whom everybody would place in the first rank as original artists." The list is short, and there are some rather characteristic names omitted; it is not a difficult thing, apparently, for a French critic to exhaust the Royal Academy and "the Grosvenor."

The water-colour artists, as M. Duret remarks, are represented at our two leading exhibitions, only in a very fragmentary manner. We feel sure that many of our readers will agree with our foreign critic in regretting the absence of any exhibition of the works of our book and paper illustrators, who, as M. Duret observes, have struck on "a vein full of savour and originality"; but it is to Mr. Keene, of *Punch*, that our critic devotes his warmest encomiums. While it is gratifying to read such praises as conclude M. Duret's article, it is matter for reflection that perhaps the first well-understood criticism on the work of Keene should reach us from beyond the Channel. We do not think, however much our exhibitions may rouse sadly differing views, that our critic's remarks on Mr. Keene will awaken the spirit of opposition,—"What drawings! full of force, of accent, of raciness, broadly treated and simple. This is high art (*voilà du grand art*), living art, which has its roots in the depths of human nature." Our witty contemporary,—who, by the way, is our contemporary in existence almost to a year,—requires by this time none of the aids of ordinary advertisement, but we think that when M. Duret closes his article with the following words, *Punch* may

look for a somewhat increased circulation on the other side of the Channel: "If you wish to see the English, living, moving, and breathing, *à l'anglaise*, touched off to the life by a thorough-going Englishman, who has borrowed nothing from ancient Greece and Italy, take *Punch* every week and look at the drawings signed with a C and a K interlaced."

It is not, as will be seen, a very comprehensive view of English art that has been presented to the readers of the *Gazette des Beaux-Arts*, but with the amusing indifference which prevails in France as to the existence of a great art movement in this country, we must be thankful to any French writer who is bold enough to dare to try and interest any of his countrymen in the successful doings of our artists.

INTERNATIONAL MEDICAL AND SANITARY EXHIBITION.

THE Exhibition formed in the Quadrant Galleries of the Royal Horticultural Gardens is now in shape, and will be opened formally on this Saturday morning, the 16th, by the President, the Right Hon. Earl Spencer. It includes 472 exhibitors, the majority of whom send matters in which our readers are greatly interested, and should be largely visited. Two classes of awards will be made, viz., "First Class," and "Award of Merit." The judges began their work on Thursday, but it is not likely that the awards will be made until after the opening. We shall hereafter give particulars of some of the principal exhibits. The following is the programme intended to be observed on the opening day:—

At half-past four o'clock the President, the Right Hon. Earl Spencer will take the chair.

Report of the Executive Committee of the Parkes Museum of Hygiene, to be read by the Honorary Secretary, Dr. G. V. Poore.

Statement of the Exhibition Committee, to be read by the Secretary, Mark H. Judge, Esq.

Addresses by the Right Hon. Earl Granville, K.G.; the Right Hon. John G. Dodson, M.P.; and Sir James Paget, Bart., D.C.L., LL.D., F.R.S.

PRESIDENT TO DECLARE EXHIBITION OPEN.

Vote of Thanks to the Right Hon. Earl Spencer, for presiding, to be proposed by George Godwin, Esq., F.R.S., F.R.I.B.A., seconded by John Erichsen, Esq., F.R.S.

The Hungarian Band will play in the arena, and the Picture Gallery, with Fine Arts Collection, will be open for promenade.

The Exhibition will be open till dusk, and at six o'clock the Hungarian Band will play in the Conservatory.

Some misunderstanding having arisen as to the delivery of the exhibits by working plumbers in competition for the prizes offered in connexion with Mr. Hellyer's lectures, we are requested to say that the work of any plumber will be received and placed in position if he sends his name and address with his proposed exhibit. Parcels should be addressed to Mr. Mark H. Judge, Exhibition-road, South Kensington. Such exhibits must be delivered by Tuesday next, so that they may be included in the appendix which will be published with the second edition of the catalogue. Season tickets will be issued to exhibitors when the exhibits are received.

CHARTLEY.

THE disproportion between the interest they excite and the intrinsic worth of their remains is characteristic of the ruins of our old castles. A broken-down tower, a few yards of shapeless wall, provided they are of undoubted antiquity, enhance the value of a whole district. The eye continually reverts to the solitary elevation on which they are mouldering away.

This is the case with all that remains of Chartley Castle after the lapse of more than 600 years. It stands upon one of a group of grassy hills between which wind slender streams that have their source in the neighbouring uncultivated moorland—the "mighty large parke" of old Leland,—and unite at length in a tolerable-sized lake in a contiguous hollow in front of the modern mansion of Earl Ferrers.

The high road runs at the foot of the hill, and sweeps of grassy meadows rise gently from it to the margin of the castle moat. The only prominent part of the ruins,—indeed, almost the only remaining part in any state of preservation,—are two lowish round towers standing near together, and connected by a short length of curtain-wall. They are a fragment of the defences of the castle on its southern face. These twin towers of grey masonry are conspicuous objects from the wide valley of the Trent, across which they look to the waste of Cannock Chase. Their bleached circles are made more prominent by the elms and ashes and black yews that shelter them, rooted everywhere on the slopes and along the margin and in the bed of the half-filled moat. Abundant ivy overruns what are now only heaps of stones, the shapeless "cores" of other walls and towers that have disappeared. There is an indestructible charm in the curves of the masonry of a round tower. The circle can afford to dispense with ornament when no other form can. The diameter of these towers is nearly 50 ft. They are two stories in height above the original level of the castle court or bailey, and formerly they may have been considerably higher; but the wild weeds and chance-sown flowers have long taken the place of their ancient cornices at a reduced level. Their external faces of ashlar masonry are well preserved; the courses of small well-fitted stones are nearly perfect. The projecting base-courses that rise direct from the slope of the moat are intact. Only some of the arrow-slits higher up have suffered. Those portions of the towers that faced inwards to the castle court, and were built square, are utter wrecks, though fragments of their walls remain, with window-jambs and sills still *in situ*, and there are steps down to a level below that of the court outside.

The steep mound to the west of the castle area, belted with waving yew-trees, marks the position of the ancient keep. The original masonry has disappeared, and brickwork of modern date has taken its place.

The successor of Hugh the Wolf of Chester, Ranulph de Blundeville, was the builder of Chartley. He began it in 1220, building as well about the same time upon the rock of Beeston. But Chartley quickly passed by marriage into the hands of the Earls of Ferrers, who held it in conjunction with the neighbouring castle of Tutbury. Neither in position nor extent can Chartley vie with either Beeston or Tutbury,—Beeston on its lofty solitary rock, visible to half Cheshire; Tutbury, on its green hill, planted in a loop of the double-branched Dove.

In 1266 Robert Ferrers, Earl of Derby, lost Tutbury, and was stripped of all his other possessions with the exception of Chartley, the result of his fruitless struggle against Henry III. It was about that time that he gave the advowson of the little church of Stow to the Priory of St. Thomas, on the river bank by Stafford, for the welfare of the souls of his wives, Mary and Eleanor. Stow Church, with its squat tower, is not visible from Chartley, an intervening hill shutting it out; but it is worth a visit for the sake of its Norman chancel arch and the arch of its south porch, and for the tomb of Sir Walter Devereux, "Earl Ferrers and of Chartley," whose effigy lies extended between those of his two wives upon a well-preserved altar-tomb in the chancel. If the sculptor has faithfully portrayed his subject, we may infer that Sir Walter was a good man, with a particularly well-arranged head of hair. All three figures carry their hands upon their breasts, the palms pressed closely together, the finger-tips pointing upwards. A hush seems to pass from the monument over the church. It suggests reverent hope, and not, as is so often the case, the despair of death.

This same Sir Walter Devereux, who died 1558, was the builder of the "goodly manor-place" that stood "a good flite-shot" from Chartley Castle, that Leland commemorates in his "Itinerary." Chartley had passed to the Devereux by marriage in 1450. Plot has preserved a view of this "principal house of the Ferrars," which shows the interior of a court with a fountain in the middle, and three sides of a timbered building, with a corner porch and gabled oriels. Hither came Queen Elizabeth in 1575, and here, in 1585, Mary, Queen of Scots, was kept a prisoner for nearly a year, brought hither from Tutbury, and hence she passed to Fotheringay to die. This "ancient edifice" was destroyed by fire in 1781. It is a remark of Hawthorne's that, owing to the excellence of the Italian climate, it is difficult to realise the age of the classical remains there, and that an English ruin looks far older than the monuments of the Roman Forum. So it is with these remains of Chartley; they seem fabulously old in the midst of a landscape from which all similar relics have disappeared. Symbols of an age wholly passed away, they are aliens on the hill, while the leaves that thicken about them in spring-time, and the grass that waves up to their very feet, belong to a scene entirely pastoral.

To see Chartley and not to see "the park" that lies about a mile away would be a great omission, for they are united in interest, and boast an equal antiquity. Were the remnants of Blundeville's towers to be plumped down on that primæval moorland, they would have a background as little changed as themselves. The park has never been subjected to cultivation. It looks to-day as it did 1,000 years ago. The trees may have dwindled away, but it has known no other change. Needwood Forest, that lies a little distance off, is scarcely more than a name. It has been absorbed, and all its mighty trees have been cut down. The park remains, and may be accepted as a patch of original England. The wild cattle of Chartley, a primitive breed, whose appearance is a sufficient voucher for their antiquity, apart from tradition, are its occupants.

D.

THE GREAT CENTRAL HOTEL, CARLISLE.

ON the 2nd inst., the Great Central Hotel, on the Victoria Viaduct, Carlisle, was opened to the public with some ceremony. A large number of guests visited the house, upon the invitation of the proprietor, Mr. Westmorland, of Liverpool, inspected the arrangements, and partook of luncheon. The new hotel, which takes its name of the "Great Central" from the circumstance that it is close to the Viaduct entrance to the enlarged Central Station, consists of four stories, in addition to basement and attics. Entering the main door from the Victoria Viaduct, the visitor finds a long corridor in front of him. On his right is a commercial room (45 ft. by 20 ft.), well lighted both by day and by night; and on the left a coffee-room (35 ft. by 20 ft.). In both rooms, as indeed in all the large rooms of the house, the Westmorland-Birkett patent ventilator has been adopted. Passing along the corridor, the grand staircase is reached, a view of which is commanded from the window of the "bar" on the opposite side of the corridor. A smoke-room is attached to the bar, and further along the corridor on the right hand side we come to a large room (33 ft. by 20 ft.), which is to be devoted to the use of farmers on Saturday. On the opposite side of the corridor are the manager's sitting-room, still-room, back stairs, lavatories, and at the end of the corridor two swing-doors admit the visitor to a billiard-room (45 ft. by 25 ft.) fitted with three tables. On the first floor are the ladies' coffee-room, situated immediately over the commercial room; four sitting-rooms with waiting-rooms and bedrooms; and, at the opposite end of the corridor, over the billiard-room, an assembly-room (45 ft. by 25 ft.). In all seventy-five beds can be made up in the hotel. In the basement there is a restaurant, 45 ft. by 20 ft., approached either from the Viaduct or through the hotel, smoke-room, travellers' stock-room, and kitchens. The architectural character may be described as "Queen Anne." Mr. Westmorland executed most of the work himself, but he let some portions which may be specified. Mr. Anderson, of Glasgow, executed the plumbing; Mr. Ormerod, of Carlisle, the cement corridors and floors; Mr. Ferguson, of Carlisle, the plaster work; Mr. Graham, of Carlisle, the iron work; Mr. Waddell, of Carlisle, the electric bells; Messrs. Forest & Son, Liverpool, supplied the ornamental glass; Messrs. Holgate & Fishwick, Liverpool, the bar-fittings. The walling stones, of white Lazonby, were supplied by Mr. W. Graves. The stone carving was done by Mr. Gedling, of Carlisle. Mr. Daniel Birkett, F.R.I.B.A., of Carlisle, was the architect.

Large Figures.—At the thirtieth annual meeting of the Birkbeck Building Society, held on July 7th, the report presented stated that the receipts for the year ending 31st March last were 7,147,763*l.* or an increase of 1,437,831*l.* over those of the previous year, and the total from the commencement of the Society 56,942,588*l.* The deposits reached the large sum of 5,789,998*l.* The gross profits earned by the Society amounted to 108,721*l.*, of which 89,759*l.* have been appropriated to the payment of interest on shares and deposits, discount, and expenses of management, leaving a net profit of 18,963*l.*, which, added to the previous balance, brings up the total of undivided profits to 132,211*l.* to be dealt with next year, when the triennial bonus has to be declared. The surplus funds are described as amounting at the present time to 2,196,750*l.*

OUR IRON AND STEEL INDUSTRIES.

BEFORE the tardily-published "Mineral Statistics," we have, in the report of the British Iron Trade Association, now issued for the past year, a mass of fact in regard to the Iron, Steel, and allied trades, and the importance of these trades, as well as the peculiar interest that just at the present time attaches to them, make a summary of some of the semi-official statements given in the report alluded to of more than common interest. The report gives what must be considered accurate details of the production and importation of iron ore, of the production of iron and steel, and a mass of other facts. One of the most notable of the features in one of the branches of the trade is the large importations of iron ore. It is shown that whilst twelve years ago the importations of iron ore from other countries were to the extent of 114,435 tons only, last year they were to the extent of 2,634,401 tons, a rate of increase far above that of the production of iron, so that it is evident that there has been an increased proportionate use of the foreign ores—chiefly of those of Spain. It is believed that the production of iron ore in the United Kingdom was to the extent of 17,300,000 tons last year; and hence it is apparent that of the total iron ores used in the country, about 13 per cent. used was imported. South Wales received the largest portion of this imported ore, but it is significant that over 658,000 tons were received for use in the Cleveland and Durham iron-making district—the district in which our largest supply of iron ores is found. Hence there is the strongest possible proof that the rich, if dearer, ores of Spain and Algeria are used in very great quantity, and this is one of the tokens of the spread of the steel industry and of the manner in which it is pushing out the use of iron for certain purposes.

Without giving the exact quantities of iron ore produced in the different districts to yield the above-stated total, it may be said that out of that total, Cleveland yielded 33 per cent., Lancashire and Cumberland 15 per cent., Scotland 17 per cent., North Staffordshire slightly less than 10 per cent., Lincolnshire under 5 per cent., Northamptonshire 8·5 per cent., South Staffordshire 3·4 per cent., and South Wales 2·5 per cent. It is worth while adding that a very small part of the iron raised is exported,—about 100,000 tons having been sent out of the country last year, nine-tenths of that quantity being sent to the United States. Coming to the production of pig-iron, we are told that whilst in 1879 there were produced 6,009,434 tons of pig-iron in Great Britain, last year there was the vast increase to the production of 7,721,833 tons. Every one of the large districts in the country contributed to that increase. Cleveland heads the list of the districts with a yield of over 2,510,000 tons, Scotland following with 1,049,000 tons; West Cumberland, 751,371 tons; North Lancashire, 745,934 tons; South Wales, 877,430 tons,—Staffordshire, 574,000 tons West Yorkshire, 285,000 tons; Derbyshire, 356,000 tons; and Northamptonshire, 167,000 tons, being the only large producing districts. It appears from a valuable return of the stocks of pig-iron in the hands of the makers that there were at the end of the year only 1,541,411 tons of pig-iron so held, or, in other words, the stocks so held were only equal to ten weeks' consumption at the rate of that of the past year. And vast as was the production of pig-iron last year, it was with a portion only of our smelting-plant, for though there were 573 furnaces in operation, there were no fewer than 394 others idle. It may be added that in the Cleveland and Durham district, the average production of each furnace has been raised from 16,000 tons yearly to over 22,400 tons yearly, whilst the average output of the Scottish and other furnaces has also greatly risen. The uses of this iron have been very varied, but the greatest variation from that of the previous year was in the great enlargement of the quantity converted into Bessemer steel.

As to the manufacture of pig-iron, we have a mass of statistics. Those of the Cleveland and Durham district are the most complete, and from these it appears that, in 1879, the associated makers in that district produced 293,000 tons; last year 508,000 tons were made,—the increase being the most marked in the plate and angle trade, and this has been at generally higher rates than that of the previous year. Roughly, it is stated that, whilst the selling price of the manufactured iron in this great district was, for the year 1879, about 1,587,000*l*., last year it rose to 3,029,000*l*. In Wales there was also a growth in the trade,—a growth to the extent of 85,000 tons on the year. It is believed that this was a general experience of the districts that yield large quantities of manufactured iron. Coming to the steel trade, we are told that last year not less than 1,044,000 tons of Bessemer steel ingots were produced in the United Kingdom,—an increase of 209,000 tons on the output of the previous year. The largest addition to the production is in the Sheffield district, next in that of the north-east, and next in that of South Wales,—these three districts giving over 176,000 tons of the increase. From part of this, the greatest production of Bessemer steel that has yet been known in the kingdom, there were rolled 739,000 tons of steel rails, South Wales producing the largest quantity, and next Sheffield; the other large producing districts being those of Sheffield, Lancashire, Cumberland, and the north-east. And, large as was the production of Bessemer steel, it appears that it was from seventy-eight converters out of 106 erected in the United Kingdom, the remainder having been idle. For the first time in the history of the Bessemer steel trade, Great Britain took only second rank as a producer, the United States exceeding our output, but by a few score of tons only. The second great branch of the steel trade is that of the open-hearth steel manufacture. Of this class of steel it appears that, last year, there were produced in the United Kingdom 251,000 tons, or 76,000 tons more than in the previous year. Practically, this is produced by the districts named above as the makers of Bessemer iron, South Wales taking the lead, and being followed, in the order given, by Scotland, Sheffield, Lancashire, and Cheshire, the north-east coast, and some smaller districts. There are now, it appears, 126 open-hearth furnaces in the United Kingdom, and, in addition, seventeen others are in course of construction, so that not only is it apparent that Great Britain is at the head of the Siemens steel trade, but that it means to remain so. These are the chief of the fresh facts brought out by this valuable report, and it is worth notice that the general tone of the teaching of the facts presented is less unsatisfactory than had been believed. The great production of iron and steel in the past year was nearly all put into consumption; and with a comparatively favourable year last, it may be hoped that there will be in the present a continuation of the recovery in our trades.

PROJECTED ROUTES ACROSS THE ALPS,

AND A FORECAST OF THE RAILWAYS OF THE FUTURE.

AMONG the abstracts of papers from Foreign Transactions and periodicals prepared for the forthcoming volume of the Proceedings of the Institution of Civil Engineers (which will form vol. lxiv. of that valuable series) will be found notices of the several views advocated by M. Colladon, by M. Maimeri, and by M. Lommel, as to the Trans-Alpine communications between France and Italy, of the different projects for which we gave some account recently (vol. xl., p. 692). These are taken, the first from the *Revue Universelle des Mines*, the second from the Italian journal *Il Politecnico*, and the third from a paper presented by M. Lommel to the Swiss Scientific Society, at a recent meeting at Brique.

The main reason, according to the Italian journal, for constructing a fresh line of communication across the Alps, intermediate between Mont Cenis and Mont St. Gothard, is to prevent the injury which France would sustain by the threatened diversion of traffic to the latter route. A railway taking the Mont Blanc route would lie altogether within French and Italian territory, while the Simplon line would run for eighty-three miles through Switzerland.

The east of France, of which Dijon is the principal centre of railway traffic, is the district chiefly affected by the line of route to be determined. Signor Maimeri has taken Collonges, a station about fourteen miles west-south-west from Geneva, and six miles from Bellegarde, on the Rhone, as a starting-point on the French side, and Milan as the corresponding centre in Italy. Between these points, the length by the Simplon is stated as 244 miles, including eleven and a half miles of tunnel at the summit. The equivalent length to be added for the resistance of the gradients is stated at twenty-one miles, making a virtual total of 265 miles.

The Mont Blanc route is seven miles shorter, as measured on the ground, than the former. The summit tunnel is three-eighths of a mile longer; but the allowance of forty-one miles necessary for gradients, according to Signor Maimeri, gives a virtual length of 278 miles, or thirteen miles more than the Simplon route. A third line is proposed by M. Maimeri and M. Stamm, involving a Mont Blanc tunnel of nine and a quarter miles, and with a measured length of 214 miles; the allowance for gradients on this route is forty-eight miles, giving a virtual length of 262 miles.

For the Simplon Tunnel, the average gradients of approach would be one in 250, and one in 205. The projected tunnel would be from 1,140 ft. to 1,650 ft., or even 1,950 ft., less elevated above the sea than the St. Gothard, the Brenner, the Mont Cenis, the Arlberg, or the Mont Blanc summits (as the latter is regarded as practicable by M. Colladon). The average gradients of approach to the latter tunnel, according to this writer, are one in 85, and one in 130.

Length of line, height of summit, and severity of gradient are, however, points as to which the comparison assumes the practicability of executing the line. This, however, is not all plain sailing. As far back as the year 1879, Dr. Stapff, the engineering geologist of the St. Gothard Tunnel, communicated to the *Revue Universelle des Mines* some very interesting observations as to the increase of temperature underground, as determined, not by height above sea-level, but by depth below the superincumbent surface. From a wide experience, in Mexico and the United States, as well as in the St. Gothard Tunnel, Dr. Stapff came to the conclusion that a heat of 104° Fahrenheit, being about 6° Fahrenheit above the ordinary heat of the human body, is the highest temperature at which work can be continuously effected by manual labour. The highest temperature observed in the Mont Cenis Tunnel was 86° Fahr. That in the St. Gothard Tunnel is stated by Dr. Stapff at 87° Fahr. on the south side, in air surcharged with moisture, and 84° Fahr. on the north, in air not quite so moist. But higher temperatures were said to have been attained at the time of the completion of this tunnel since the publication of the above paper, of which we have no exact record.

The rate of increase of temperature with depth depends on the cross section, as well as upon the longitudinal section, of the surface above the point of measurement. Thus, comparing equal depths below a mountain peak, or below the bottom of a valley, the heat would increase proportionately much faster in the latter case. As a mean, Dr. Stapff proposes the allowance of 1° Fahr. for every 88·1 ft. in depth below the surface, the increase being less below a peak, and more below a hollow.

For the higher and shorter tunnel, proposed by M. Stockalper through the Simplon, at a height of about 2,560 feet above sea level, M. Stapff estimates the depth below the ridge at about 5,900 feet, and the rock temperature midway in the tunnel at 104° Fahr. But in the longer and lower tunnels projected by Messrs. Favre & Co., and by M. Lommel, the depth below the ridge would be 7,300 ft., and the temperature midway 116° Fahr. for the rock, and 127° Fahr. for water issuing from the rock. The utmost cooling effect produced in the St. Gothard tunnel, when four rock drills were at work, discharging exhaust-air at from 2½ to 4 atmospheres pressure, did not exceed 7° Fahr., and during the clearing away of the material excavated the heat of the air continued to rise to as much as 7° Fahr. above the rock temperature. It is evident that this carefully collected experience can only be neglected at the peril of any projectors. M. Lommel argues from some statements as to the temperatures in the Comstock mines, Nevada, that the air temperature can be kept as much as 14° Fahr. below the rock temperature. He has, however, made no allowance for its occasionally rising higher.

The estimate of Signor Tatti, a colleague of M. Colladon, for the Simplon tunnel of 11½ miles long, is about 3,600,000*l*., or about 313,000*l*. per mile. To this has to be added 150,000*l*. for connecting the northern end with the present railway terminus at Brique, and 640,000*l*. for 12½ miles of line from its southern end down to the railway terminus at Domodossola, making a total of 4,390,000*l*. for the entire work. For the Mont Blanc tunnel of 11⅛ miles, he allows the same sum of 3,600,000*l*., to which he adds 1,136,000*l*. for 22½ miles of line at the southern end, and 2,054,000*l*. for 49¾ miles at the northern

end, making in all 6,790,000*l.* Signor Maineri considers that the work could be done cheaper. He estimates the Mont Blanc tunnel of 9¼ miles at 2,646,000*l.*, being at the rate of 164*l.* per yard, that estimated for the St. Gothard tunnel. From the southern end to Aosta he reckons barely 22 miles of line at 32,000*l.* per mile, and from the northern end to Cluses he takes as 26¾ miles more at the same rate. The 13½ miles from Cluses to La Roche he puts at 25,600*l.* per mile, making a total for the route of 4,555,200*l.*

It must be evident to any careful observer that a halt ought to be called in any projects as to new lines through mountain passes, in presence of the recent discoveries in the transmission of electricity, and in its application to railway traction. At least, 2,000 h.p. of water power is said to be available at each end of the proposed Simplon tunnel; and in the other lines, no doubt, water power is almost equally attainable. The reduction of a summit is a piece of work for which, mechanically regarded, it may be worth while to pay very heavily. But, on the other hand, the proportion of the weight of the engine to that of the trains increases so rapidly with the angle of the gradient that it would take less power to take carriages alone up a gradient, say of one in forty, than to run the same carriages as a locomotive train over a gradient of 1 in 100. Nor is there any corresponding drawback as to speed. If the enormous dead-weight of the locomotive can be, as appears highly probable, dispensed with, the entire problem of railway transit over mountainous country will have to be reconsidered. The commercial utility of expending large sums to secure good gradients will become a matter to be investigated anew. The main features of the case will be altogether altered. We do not say that this is yet the case. But we say that it has been shown certainly to be conceivable, perhaps to be possible. And if we add the hope of the solution of the two problems, that of the utilisation of water-power, and that of the traction of trains without locomotives, together, and suppose each of these problems to be ultimately soluble as dynamical questions, the days of long tunnels, deep cuttings, and lofty embankments for any new lines will be over, and the smokeless railways of the future will undulate over hill and dale with all the freshness and variety of the old coaching traffic, which had attained a state of such perfection on the Devon and on the Worcestershire roads just as the steam-horse was introduced to run the four spanking high-breds off the road.

ARUNDEL MONUMENTS, CHICHESTER CATHEDRAL.

THESE monuments stand at the east end of the nave, north aisle. The lithographs represent the effigies of these tombs, the one with the male and female figures representing Richard Fitzalan, 14th Earl of Arundel, and his countess, the former beheaded in 1397. The single female figure is believed to represent Maud, Countess of Arundel, who died in 1270; the figures are recumbent. The earl's tomb was restored in 1843 by the late Mr. E. Richardson, of London, the restorer of the effigies of the Knights Templars in the Temple Church, but that of the Countess Maud is much mutilated, and has not undergone any restoring process. My drawing, however, shows the figure as it would appear if restored. This effigy has been much admired for the beauty of the drapery. A cast in plaster was made of the tomb some years ago for the Archæological Society, and subsequently another for, I believe, the Crystal Palace.

W. HAYDEN.

Royal Archæological Institute. — The Royal Archæological Institute, of which Lord Talbot de Malahide is president, has arranged to hold its annual congress at Bedford this year, during the week which extends from Tuesday, July 26th, to Monday, August 1st. Among the places set out on the programme to be visited are Elstow Church, the home of John Bunyan, Houghton Conquest, Bromham, Woburn Abbey, Wrest Park, Luton, Dunstable Priory, the Roman camp and amphitheatre near Howbury and Sandy, St. Alban's Abbey, and the ruins of Old Verulam, Sharnbrook, Felmersham, Tottenhoe Castle, Willington, Cople, the earthworks at Bernard's Heath, and Risinghoe Castle. Mr. Charles Magniac, M.P., of Colworth Park, will act as president of the meeting.

ARCHITECTURAL AND ARCHÆOLOGICAL MUSEUM, BARCELONA.

BARCELONA is passing through the same vicissitudes which old and venerable cities mostly undergo at the hands of modern civilisation. Notwithstanding the great importance which the city enjoyed in the times of its early kings and during the Roman period, and the high position it has held in the history of the Spanish nation, and notwithstanding the fact, moreover, of its precincts having been adorned at one time with remarkable and beautiful palaces, convents, and other edifices of various styles of architecture of all ages, there scarcely remain now any of that number. Some are in ruins, others have disappeared entirely in consequence of political changes, while streets and squares have been opened on sites where formerly stood splendid monuments.

From this destruction, however, may be excepted the building called the Church of Santa Agueda, a lofty and well-shaped edifice, standing in the Plaza del Rey, adjoining the palace of the kings of Aragon, which is at present partly the convent of Santa Clara, and for which this church formerly served as the chapel. The walls of the edifice have recently been restored, its deterioration being caused partly by the events of 1835, partly by the use to which the building had been applied on several occasions. Such a use, unadapted to its preservation, was accelerating its total ruin, which, had it not been guarded against, in course of time would have resulted in irreparable loss. The preservation of this church is due to the praiseworthy exertions and zeal of the Provincial Committee of Monuments, which devoted its energy to attain this purpose, by collecting funds necessary to meet the heavy expenses involved, sparing neither pains nor means to make it appear at the present day precisely the same as it was in former times. The wishes of the Provincial Committee have been crowned with much success, and Barcelona is now proud to possess an historico-artistical monument, which will remind future generations of the authority and good taste of the sovereigns who maintained the dignity of the ancient crown of Aragon.

The Chapel of Santa Agueda is a work of the thirteenth century. It consists of a high and well-shaped nave of the Gothic style of that period, its roof being adorned with an ornamented ceiling. Admission to the choir is to be had by two staircases made through the walls of the edifice, one for women and the other for men. In the façade there are small windows, which are partly filled by painted glass containing representations of persons celebrated in the history of Catalonia. The belfry is one of the most noteworthy that exist in Barcelona.

Within this building the Museum of Architecture and Antiquities, founded by royal order, is temporarily installed. Its principal portion consists of the objects which formed the collection made by the Provincial Committee of Monuments, as well as those possessed by the Royal Academy of Belles-Lettres, thus making it a museum which, although not at present very comprehensive, is yet worthy of being visited by the lovers of art and archæological studies. It is to be hoped, however, that it will soon increase.

The specimens in the museum amount to 1,296 in number; they are not, however, arranged in separate sections, for want of sufficient room, a circumstance, too, which serves to prevent new acquisitions. On the side-walls of the chapel is shown an important series of keystones, fragments of pillars, and slabs containing inscriptions of the Middle Ages, and another of beautifully engraved medallions of the age of the Renaissance, shields of corporations, as well as those of the Catalonian nobility, and of the city of Barcelona, saved from the old buildings and convents lately pulled down. In the place formerly used as the presbyterium stand now, symmetrically arranged, some tombs of the Catalonian nobility and bishops. On the floor may be seen the valuable mosaic work found at Palau, in April 1861. It represents a Roman circus, 25 ft. long and 10 ft. wide, of which a description has been published in the *Musea Universal*.

Near the mosaic work, between two Roman pillars and various altars, is a statue in Greek drapery, beautifully arrayed. In the choir of the chapel is placed the collection of articles purchased from Don Eusebio Fortun, the Spanish consul at Arles, and which consists of a choice selection of pottery, arms, and articles of domestic use of the Romans, and various other objects of earthenware of Spain.

On the principal altar and its sides is to be seen an arrangement of variously ornamented frames of the fifteenth century, some of which possess merit, and are of historical importance, on account of having been paid for by Prince Dom Pedro of Portugal, pretender to the crown of Aragon.

On the outward side of this chapel stands a large collection of inscribed slabs, pillars, and Roman epitaphs, the former being very valuable, as an evidence of the political, religious, and social constitutions of the Romans. Besides these, there are also some fantastic gorgets,—large shields which had belonged to the demolished ramparts of Barcelona, and many slabs containing inscriptions in Hebrew, obtained from the mountains of Monjuich. There is also within the rails, within which these objects are enclosed, a tall pillar worthy of mention, belonging to the temple of Hercules, in Barcelona, and an emblem of nature worship, of colossal dimensions, held to be a rare specimen. Such is a succinct description of the illustration which we give in our present number.

FOXBURY, KENT.

THE mansion illustrated by the accompanying perspective view of the entrance front, and plan of the ground floor, is erected upon an estate of sixty acres, on rising ground to the right of the Kemnal-road, Chislehurst.

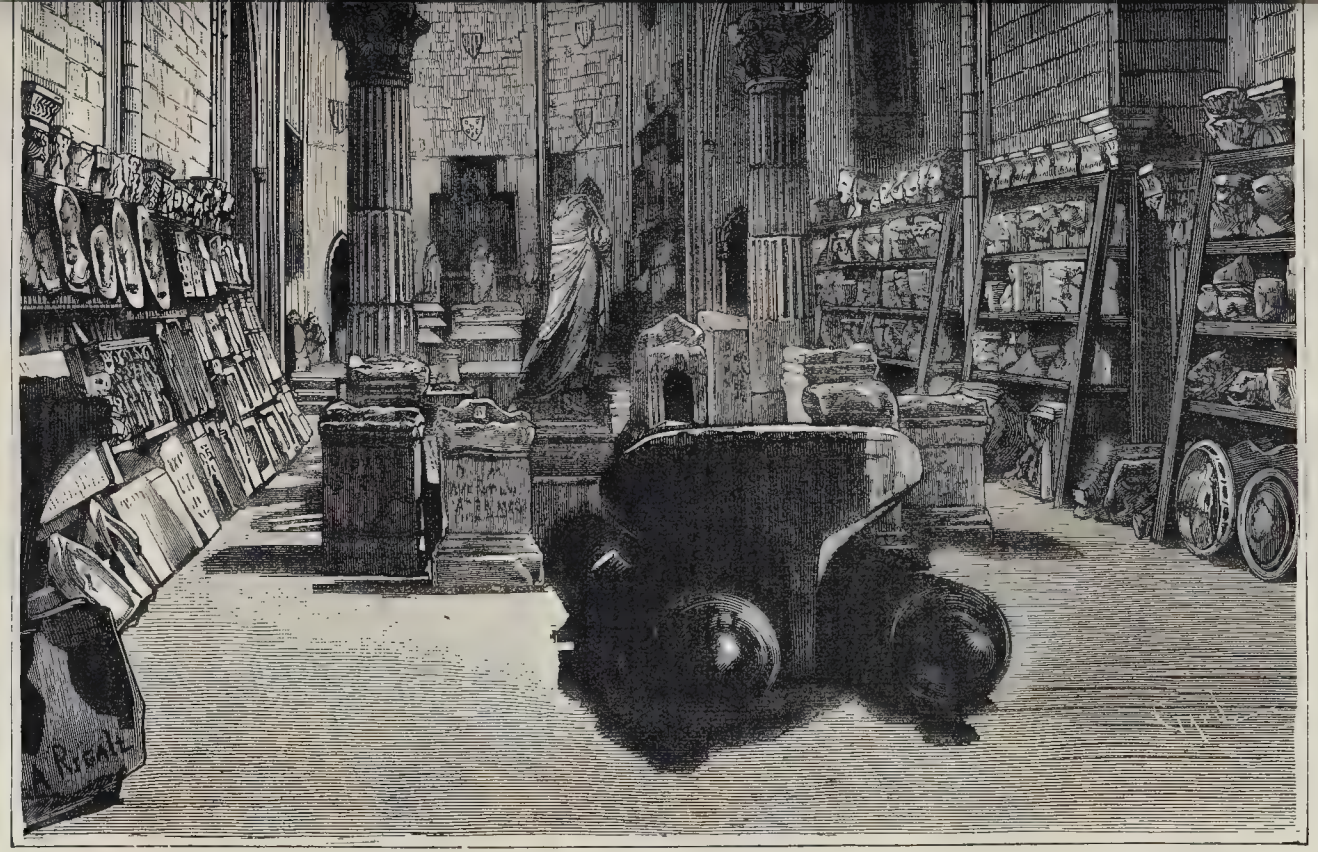
The external walls are built hollow, with Hassock stone rubble-work, faced on the outside with Kentish rag-stone laid in random courses, with a rock face, and lined on the inside with brickwork in cement. The masonry of the cornices, windows, doorways, &c., is of Combe-Down Bath stone, and the roofs are covered with Broseley tiles. The corridors throughout are of fire-proof construction, upon Fox & Barrett's principle. The principal rooms have been decorated with enriched panelled ceilings and characteristic high mantelpieces of oak, cedar, and walnut, inlaid with other woods, and the walls of the dining-room are lined with wood framing of pitch-pine.

The illustrations sufficiently show the general character of the architecture (which is that of the early part of the seventeenth century), and the arrangement and sizes of the rooms.

The principal entrance is on the east side, through an enclosed porch, paved with marble mosaic executed by Messrs. Burke & Co., leading into the entrance-hall, which is separated from the corridors and principal staircase by arcades of Portland stone.

The principal staircase, which is 19 ft. 6 in. square and 27 ft. high, has a wainscot oak staircase of three flights, protected by balustrades of pierced strapwork, with large newels at the landings, surmounted by heraldic animals after the fashion of those at Hatfield House and other houses of similar date. The staircase windows are filled with grisaille glass, having armorial medallions in the centre of the lights, carried out by Messrs. Heaton, Butler, & Bayne.

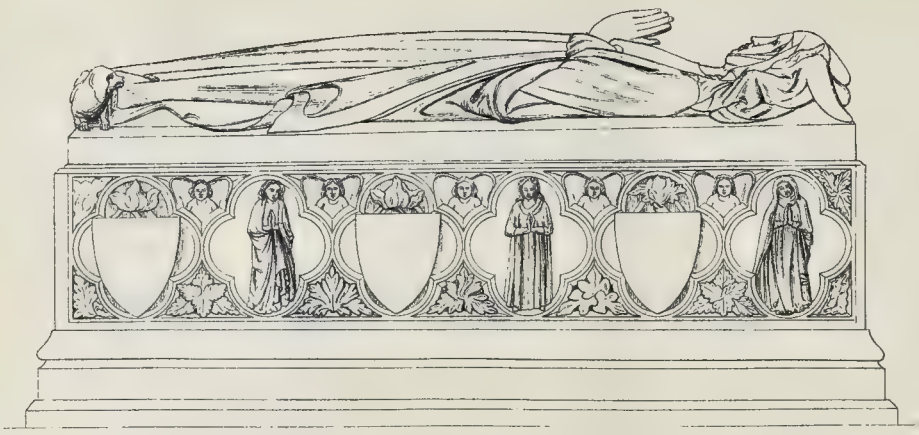
On the first floor, which is 11 ft. high, there are eleven bedrooms and dressing-rooms, and three bath-rooms, the servants bedrooms being arranged over the offices.



The basement-story is appropriated for the heating apparatus, wine, beer, and coal cellars, icehouse, &c.

The approach-roads and gardens were laid out by Mr. Milner, and lodges are placed at the junction of the carriage-drives with the Kemnal-road. The stables and kitchen-garden, with gardener's cottage and extensive greenhouses, are arranged on ground to the north-east of the mansion.

The whole of the works were carried out from the designs of Mr. David Brandon, by Messrs. Hill, Higgs, & Hill.



Fall of a Church Roof.—The roof of a church at San Mateo, Mexico, fell in during service on the morning of the 5th inst., killing over thirty of the worshippers present, the greater number being women. The church was being partially rebuilt, and while a party of men were working on the roof, one fell through, and the sudden rush of all the others at the same moment in their endeavours to get off, caused the remainder of the roof to collapse. It is reported that twenty of the workmen were killed, and that several were fatally injured.

SANITARY PLUMBING.

HOUSE DRAINAGE.

THE fifth* of Mr. Hellyer's course of six lectures to working plumbers, under the auspices of the National Health Society, was given by him on Tuesday evening last, in the Hall of the Society of Arts. Mr. Rogers Field, C.E., presided.

Mr. Hellyer said the last subject dealt with ("Traps and Trap Ventilation") extended itself so much that if he kept strictly to the syllabus for the present lecture he should have to drop out the first half of the subject which should be dealt with on the present occasion, viz., "House Drainage and Ventilation." He therefore proposed to deal with the question of house drainage in the present lecture, and to postpone the subject of ventilation to the last evening of the course, substituting a lecture on that subject for the one announced on "The Art of Lead-Laying," which lecture he proposed to drop entirely out of the course. In commencing the internal plumbing† of a house, plumbers generally began with soil-pipes, but before they could get such pipes ready for fixing they required to know the kind of water-closets to be fixed upon them, so as to arrange the branches and traps accordingly. Privies served their purpose well enough when every man had a garden or piece of ground; but when men congregated together in cities and towns, remote places for putting such conveniences could not be found, and drains and sewers had to be made into which the general slops of the house were thrown. Instead of building water-closets as we do now, the rich ancients used close-stools or pans, which were frequently made of gold, besides the water-closets which were made in vaulted recesses in their kitchens. The Romans placed vases called *gastra* upon the edges of roads and streets for the relief of passengers, just as we now fixed urinals. Water-closets were of very ancient date. In Sir William Hamilton's account of "Discoveries at Pompeii," he says, in a paper ‡ read before the Society of Antiquaries in 1775, "Close to the Temple of Isis is a theatre, no more of which has been cleared than the scene and the corridor that leads to the seats. In this corridor was a retiring-place for necessary occasions, where the pipe to convey the water, and the basin, like that of our water-closets, still remain, the wood of the seat only having mouldered away by time." Fosbroke, in his "Encyclopædia of Antiquities," (p. 397), says, "The water-closet in the Palace of the Cæsars is adorned with marble arabesques and mosaics; at the back of one is a cistern, the water of which is distributed by cocks to different seats." Olympiodorus says that in the Thermæ of Antoninus there were 1,600 seats of marble pierced like *chaises-percées* for the convenience of those who bathed.§ The fall of the Roman Empire led to the disuse of water-closets, and to a return to the customs of earlier ages. Beckmann says that in Paris, so late as the fourteenth century, the people had the liberty of throwing anything from their windows whenever they chose, provided they gave notice three times before by crying out "*Gare l'eau!*" This practice was, we learn, forbidden in 1395.‖ A like practice, however, seems to have continued much longer at Edinburgh, for in A.D. 1750, when people went out into the streets at night, it was necessary, in order to avoid disagreeable accidents from the windows, that they should take with them a guide, who, as he went along, called out with a loud voice, "Hand your han!" At that period, when the luxury of water-closets was unknown, it was the custom for men to perambulate the streets of Edinburgh, carrying conveniences (pails) suspended from a yoke on their shoulders, and enveloped by cloaks sufficiently large to cover both their apparatus and customers, crying, "Wha wants me for a bawbee?"¶ In a Parisian code of laws, which was improved in 1513, it was expressly ordered that every house should have a privy; but in the year 1700 they had not that convenience in every house, for at that time the police had instructions to see that each house had a privy, or to lock the house up if the occupants did not make one within a month. Sir John Harrington is credited by Nares with the invention of the English water-closet or latrine, in Queen Elizabeth's time, but Fosbroke says that was a mistake, though probably Sir John made them known in England. Aubrey, writing in 1718, describes a water-closet he had seen. He says,—"Here [at Sir Francis Carew's, Beddington, Surrey] I saw a pretty machine to cleanse an 'house of office,' viz., by a small stream of water no bigger than one's finger, which ran into an engine made like a bit of a fire-shovel, which hung upon its centre of gravity, so that when it was full a considerable quantity of water fell down with some force, and washed away the filth."* The first patent in this country under the laws of Patents for Inventions, was granted by James I. in 1617; but, according to the Records of the Patent Office, not a single patent was taken out for a water-closet until the year 1775, or 158 years after special licences were first granted for protecting inventions. In the year named, Alexander Cumming, a watchmaker, in Bond-street, took out the first patent for a water-closet, than which many water-closets in use at the present day were more unsanitary. The trap under Cumming's closet is shown by the drawing attached to the specification of the patent to have been a "round-pipe" or syphon-trap. Two years later (*i. e.* in 1777) Lemuel Prosser, a plumber living in the parish of St. Martin-in-the-Fields, took out a patent for what he describes in his specification as "a water-closet upon an entirely new construction, which will always remain free from any offensive smell." In spite of its inventor's claim, however, Mr. Hellyer thought that Prosser's closet was about as bad as the pan-closet, in being a closet which would never be entirely free from an offensive smell. In 1778 Joseph Bramah, of Cross-court, Carnaby-market, Middlesex, cabinet-maker, took out a patent for his invention of the now well-known valve-closet, which has since its inventor's time been improved in many points. But the difficulty of getting the "slider" of Cumming's closet, and the cranked metal valve of Bramah's, to always seat themselves so as to keep their basins fully charged with water, and to stand rough usage, led to the introduction of the pan-closet. William Law, a founder in Soho, made certain improvements in pan-closets in 1796. But such closets were not much used, though other improvements were made in them, before the early part of the present century. In 1826 William Downe, senior, of Exeter, also a founder, made further improvements in the pan-closet, reducing the size of the "container." One reason why the pan-closet had had a larger sale, and been more extensively used than any other closet, was that there were no valves about it, apart from its supply, to get out of order. It would also stand rough usage when well-made better than any other closet of its kind, but, on the other hand, it was the most unsanitary water-closet that the lecturer knew of, and ought never to be used. He was free to condemn it, for though nearly every water-closet maker made it, it belonged to nobody in particular. He was bound to admit that his own firm made them, for people would have them; but he never allowed one to be made if they could help it. His firm had porcelain enamelled the interior of the container part years ago, and they had made that part in white ware; but, no matter of what material, the pan-closet could never be made a wholesome one. Great care should be taken in selecting self-cleansing water-closets. No closet should be fixed which would not allow a flush of water of two, three, or four gallons to cleanse every part of it which could become fouled by usage. The less surface there was in a closet or trap, the better it could be cleansed, and unless such fittings were thoroughly cleansed after each usage they were sure to become unwholesome. He did not intend to point to any man's make in closets, nor would he bring his own before the meeting, for when self-interest came between a man's eye and any object, it interfered with its true proportion. All that he asked for was, that no watercloset should be fixed which would not allow itself to be thoroughly cleansed, and its trap to be washed out, every time it was used. Passing to the subject of soil-pipes, the lecturer thought that lead was the best material for them, especially for this climate. The only material that at all came into competition with lead for soil-pipes was cast-iron, but he gave lead the preference, because it was more durable, more compact, and more wholesome. He did not pronounce for lead because of any fear that if cast-iron soil-pipes got into general use, it would injure the plumbing trade, for if the plumber could fix lead soil-pipe, which required the greater skill, on account of its "purpose-made" bends and wiped soldered joints, he could certainly fix cast-iron soil-pipe, which required the lesser skill, for the bends and socket branches in the latter case would be cast for him, and ready to hand; while as to the jointings, he would have no difficulty whatever in making them, whether (as in the case of light iron pipe) they were made with spun-yarn and red-lead, or in "cement," or whether the joints were caulked with lead, as they should be when the strength of the iron pipe would admit of it. No cast-iron soil or waste-pipe that would not admit of the joints being made of lead and well caulked should be fixed inside a house. Where plumbers were not skilled in pipe-bending and joint-wiping, it might be preferable to use cast-iron soil-pipe. Cast-iron certainly had the advantage over lead that a carpenter could not drive a nail, bradawl, or gimlet, into it, and when a soil-pipe was fixed inside a house it was worth something to the occupant to know that. Then, again, when the waste-pipes from baths and sinks were taken into a soil-pipe, as in the United States, it was better to use cast-iron, for the action of hot water upon thin lead soil-pipes was very injurious, unless slip-joints were used to allow for expansion and contraction; but, of course, it would not do to fix soil-pipes or waste-pipes with slip-joints inside a house. As to the size of soil-pipes, fifteen or twenty years ago it was common for plumbers to fix (under the direction of a specification) a 6-in. soil-pipe when it had to take the branches of four or five water-closets; and, with many of the architects and builders, as well as the plumbers, of to-day, 5 in. and 4½ in. were the general sizes, even where there was only one water-closet. Now, as it was of the utmost importance that a soil-pipe should be efficiently flushed out with water every time a water-closet upon it was used, it was evident that the smaller the size of the pipe the more efficiently would it be flushed, and as it was not wanted for a coal-shoot or a dust-shaft, the lecturer could not see why it should be so much larger than the outlet-way of the water-closet into it. In private houses, where the water-closets would be used with greater care than in public buildings, he considered a 3½-in. lead soil-pipe quite large enough to take a tier of three water-closets. (He was supposing the soil-pipe to be ventilated at top and bottom, and each trap ventilated as well.) He considered that a 4-in. soil-pipe, when of lead, and made by hydraulic pressure, was large enough to take the branches from several more water-closets, and that a 4½-in. soil-pipe was ample to take a tier of six double closets. He had had 3½-in. lead soil-pipes fixed to take tiers of three water-closets, and he had never known the smallest inconvenience to arise from that arrangement, while the pipes were found to keep cleaner than 4-in. soil-pipes near them. As to the position of soil-pipes, whether they should be outside or inside a building, he gave his voice in favour of outside. There was no danger of the stoppage of a soil-pipe by frost if there were no leaky closet-valves to let the water trickle into the pipe. The effect of frosty weather upon outside soil-pipes was not so damaging as the action of the sun upon them when they were fixed in certain positions, for they were often exposed to the direct rays of the sun for many hours together, the effect being to stretch the pipe between the "tacks," and such stretching would go on from year to year, bending the pipe out of its true vertical line, and perhaps breaking it. Where slip-joints could be used, such lead-pipes (when properly ventilated to prevent the action of gases upon them) would last for centuries; but where the joints must be soldered, the pipes should be placed in an angle or recess where they would be screened from the rays of the summer sun. In conclusion, Mr. Hellyer treated at great length on the ventilation and fixing of soil and waste-pipes, and of their proper disconnexion from drains. He urged that to get good water flushes through waste-pipes from sinks and lavatories, the inlets into such wastes should be as large as, if not rather larger than, the bore of the pipes, so as to get an efficient flush. Where the inlet into a waste-pipe was of smaller bore than the pipe itself, the latter could not possibly be efficiently flushed.

The Chairman spoke of the value of Mr. Hellyer's lectures as enunciating correct principles. He agreed with almost everything Mr. Hellyer had said, particularly as to the small risk of danger to outside soil-pipes from frost. During the severe winter of 1878-79, in only one case out of a large number of instances in which open soil-pipes had been fixed under his superintendence, did freezing take place, and that was found to be owing to a leaky closet valve. He published the results of his inquiries in the *Builder* at the time.* In conclusion, the chairman announced that, in deference to the desire which had been expressed, that an evening should be set apart for discussion at the conclusion of the course of lectures, the National Health Society would endeavour to make arrangements to that end.

An amusing though somewhat heated discussion arose, led by Mr. Pullen, who seems to have constituted himself the champion of the D-trap. He contended that it was a much better trap than the round-pipe or syphon trap, and, notwithstanding what Mr. Hellyer had said in a previous lecture to the contrary, that it was a self-cleansing trap. Mr. Davies also stood up for the D-trap, remarking that Bramah, so far from discarding it, used it under his valve closet. Mr. Pullen thought fit to question the competency, if not the impartiality, of the judges of the specimens of plumbing sent by working plumbers who have attended Mr. Hellyer's lectures (in competition for the prizes offered) to the International Medical and Sanitary Exhibition at Kensington. Mr. Gosling twitted the lecturer with inconsistency in making and supplying pan-closets when he condemned them, but Mr. Hellyer very fairly retorted by asking what was a man to do when, having taken the contract for the plumbing work and sanitary fittings in a large building, he was told, after a great part of the work was done, that pan-closets must be substituted for those originally intended to be used? He could only comply with the order, though protesting against the want of sanitary knowledge on the part of those who preferred such unwholesome appliances. The meeting broke up in confusion, not to say disorder.

The next and concluding lecture of the course will be delivered on Thursday, the 28th inst.

SANITARY MATTERS IN BIRMINGHAM.

ASSOCIATION OF MUNICIPAL AND SANITARY ENGINEERS AND SURVEYORS.

THE annual meeting of this Society was held in Birmingham last week, commencing on Thursday, the 7th inst., in the Council House. At the business meeting the retiring president, Mr. A. W. Morant, of Leeds, temporarily occupied the chair. Among the members present were:—Messrs. W. S. Till, Birmingham; Lewis Angell, West Ham; J. G. Lynde, Manchester; E. Pritchard, hon. sec. for the Midland district; F. Ashmead, Bristol; J. Allison, Manchester; R. Vawser, Manchester; C. Jones, Ealing; T. Cole, Westminster; T. T. Allen Stratford-on-Avon; H. P. Boulnois, Exeter; J. W. Brown, Aston Manor; G. Cole, Hereford; J. Cook, North Brierley; J. H. Cox, Bradford; B. C. Cross, Dewsbury; A. T. Davis, Solihull; J. T. Eayres, West Bromwich; E. B. Ellice Clark, Hove; J. Gordon, Leicester; R. Hodge, Plymouth; G. Jennings, Rotherham; G. B. Jerram, Walthamstow; J. Lobley, Hanley; H. V. McKie, Carlisle; A. W. Parry, Reading; J. P. Spencer, Tynemouth; G. E. Thomas, Wolverhampton; S. E. Thorold, South Stockton; W. H. White, Oxford; T. W. Bayliss, Redditch; J. Cartwright, Bury; T. Broughton, Warwick; T. Gledhill, Heckmondwike; D. Hildred, Batley; G. W. Sadler, Cheltenham; H. Mitchell, Hyde; J. H. Hall, Liverpool; J. Devis, Oldbury; W. J. Boys, Walsall; W. Blackshaw, Congleton; A. Crier, Lancaster; J. H. Burton, Audenshaw; and J. W. Fereday.

The annual report, which was read by Mr. Cole, stated that twenty-five new members had joined the association this year, three members had died, and the total membership now numbered 204. The members were urged to make every effort to increase the roll of the association.

The report was adopted, and Mr. Morant then vacated the chair, which was taken by Mr. W. S. Till, president-elect for the ensuing year.

Mr. Till, in his presidential address, expressed the hope that during this, the third visit of the association to the borough of Birmingham, some useful information might be gained by the members, and that the objects of the association,—the dissemination amongst the members of that knowledge and practice which fell within the department of an engineer or surveyor engaged in the discharge of his duties under the local and public Acts of Parliament,—might be attained. He had, therefore, prepared a brief description of the borough, together with information as to its streets, night-soil, and sewage works, that he thought would be interesting to the meeting. After giving various statistics as to the former points, Mr. Till explained the sewage arrangements. The Council in 1872, with the view of reducing the difficulties connected with the treatment of the sewage at Saltley, decided upon the introduction of the pan system for collecting night-soil, and at the end of last year there were about 32,000 pails in the borough, estimated to provide for about 250,000 persons. There were about 1,000 water-closets, and the remainder of the population were supplied with the old form of combined privy and ashpit. The cost of the night-soil department in 1880 was 42,996*l.* 17s. 5d., of which 27,196*l.* 2s. 2d. was for collection, &c., of pail contents, and the remainder for the removal of old night-soil; the receipts for the pail contents were 5,702*l.* 3s. 1d., and for old nightsoil 1,992*l.* 8s. 7d., or a nett cost to the borough of 35,296*l.* 5s. 9d. The drainage of the borough was commenced in 1852 by the construction of the Hockley Brook and the River Rea main intercepting sewers, under the superintendence of Mr. Pigott Smith. The total length of sewers now under the care of the Corporation was about 175½ miles. The history of the treatment and disposal of the sewage had until recently been one of difficulty and opposition. In consequence of the proceedings instituted by Sir C. B. Adderley, the Public Works Committee, which had the matter then in hand, presented a report to the Council in June, 1871, recommending the acquisition of from 2,000 to 2,500 acres of land down the Tame Valley; but this being considered too costly, the Corporation, on the recommendation of the Sewerage Committee, promoted a Bill in Parliament, in 1872, for the purchase of 800 acres of the same land near Kingsbury, about eight miles below the present outlet. Owing to the lengthened opposition of the landowners in the neighbourhood, the Bill was thrown out on the third reading. To satisfy the requirements of the neighbourhood, the lime process was at once adopted, and more land was obtained at Saltley, and four additional sets of subsidiary tanks were constructed, to which another large tank had recently been added. Upon the United Drainage Board, which was formed in 1877, now devolved the duty of treating and purifying the sewage delivered by the various constituent authorities at the outlet works. The area of the present Saltley Farm was 272 acres, of which 170 was freehold. The three large tanks and sixteen smaller ones had a capacity of 43,310 cubic yards, or about 7,300,000 gallons. The amount of sludge deposited in the tanks during 1880 was 1,784,000 cubic yards, or about 490 cubic yards per day, and required an area of 53½ acres of land for digging in the same, or rather more than one acre per week. The average dry-weather flow of sewage was about thirteen million gallons per day, the population contributing to that amount being roughly estimated at 450,000, being about 29 gallons per head. A little over 13 tons of lime were used per day, the lime being slacked and ground with water under edge-runners. No nuisance arose from the present method of dealing with the sludge, as was sufficiently proved by the fact that there were nearly 3,000 houses within half a mile of the boundary, and no complaints were made by the inhabitants as to the operations now carried on. Mr. Till concluded his address by assuring the meeting of his anxiety to do all he could for the benefit of the association.

Votes of thanks were accorded to the past president and to Mr. Till for his address.

Several amendments of the rules were discussed. It was resolved to limit membership to the chief officers of corporations and sanitary authorities, and that members who after 1881 ceased to hold any public appointment should be eligible for re-election, but disqualified from holding any office under the association.

The members then visited and inspected the outfall sewage works and sewage farm of the Birmingham Tame and Rea District Drainage Board at Saltley, being met by Alderman Avery (Chairman of the Board), who accompanied the party over the works. The intercepting works in Montague-street were subsequently inspected.

The proceedings of the morning sitting on Friday, the 8th, were opened with a discussion as to the works of the Birmingham Corporation visited on the previous day.

Mr. J. Lemon (Southampton) said he must enter his protest against what he considered one of the most disgraceful exhibitions of sanitary work he had seen. He referred to the intercepting works at Montague-street. He wanted to know why there should be one system for the rich and another for the poor, and he hoped the Corporation would see their present folly, and would at no distant date altogether remove that Montague-street abomination. The present system of the Corporation was most insanitary and expensive. It meant that out of the population of Birmingham, 300,000 persons were using the pail system, and about 100,000 were using water-closets. Judging by the mileage of sewers, he supposed the town was tolerably well drained, and why should they not, therefore, take away the excreta at the time the slops were removed? No larger area was required than to take away the slops only, and the objection on the ground of expense was absurd, and required no answer. The only advantage alleged to be possessed by the system in Birmingham was that the excreta was got rid of at the cut-fall, but he pointed out that they did not evade the cost of removal, for the Corporation paid 35,000*l.* per annum for this. The system of sewers existing in the town was fully capable of removing by water-carriage the whole of the excreta of the borough with more efficiency and less nuisance. The present mode was likely to spread disease, and was, therefore, revolting to every sanitarian. He was at loss to know why the Corporation carried it on, and he felt it his duty to call upon the members to speak openly and fearlessly against one of the most abominable systems in this country.

Mr. Gledhill (Heckmondwike), speaking more particularly with regard to the disinfection of material collected, said he should be very sorry to recommend his Board to follow the example of Birmingham.

Mr. E. B. Ellice Clark (Hove) similarly condemned the system of Birmingham, though he admitted it had obtained its greatest possible advantages in that town. In Liverpool and other large towns the water-carriage system was carried out in its entirety. This was proof that the system could be used by the poor people anywhere. It was difficult to understand why the pail system was being continued. They could hardly imagine it was the pet hobby of an individual, but it was extraordinary that year after year should pass by, and the system should be developing itself all over the North of England, without some statistics as to its superiority over water-carriage.

Mr. J. Lobley (Hanley) urged that the cost of the removal of the pails was money entirely thrown away.

Mr. C. Jones (Ealing), general hon. sec., followed on similar lines, expressing his regret they had heard no defence of the pail system. He confessed the state of things existing in Birmingham was utterly inexplicable to him. Remembering that the system was conducted by gentlemen of position, influence, and scientific knowledge, it staggered him to find how they differed with him upon a question of so much propriety, and he used this word with the fullest meaning. He must, in common with his professional brethren, put his veto on the Association in any way, directly or indirectly, supporting a system which they regarded as so crude, not to say rude, immoral, and bad. Though carried out in the best possible way, the system was still bad in the fullest sense of the word.

Mr. Lewis Angell (London) regarded the pail system of Birmingham as thoroughly degrading and demoralising in every possible way, affording a most disgusting occupation for a number of people, and an admirable system, even if carried out as they saw it on the previous day, for disseminating disease in all directions.

Mr. E. Pritchard (secretary of the Midland Counties District) expressed his disapproval of the system of interception and pan removal.

Mr. J. G. Lynde (Manchester) and Mr. J. Gordon (Leicester) having continued the discussion,

Mr. R. F. Martineau, who was present as a visitor, said on behalf of the committee that he was prepared to defend the pail system tooth

* *Builder*, vol. xxxvii. (1879), p. 239.

and nail. The members of the Association must recollect the circumstances of Birmingham under which the pail system was adopted. When the enormous population of Birmingham and its rapid growth were considered, he thought the engineers present would recognise the immense cost that would have been necessary to obtain land enough to treat properly the whole of the sewage. With reference to the water-closet system, he supposed it must be a matter of the greatest possible difficulty, if not one of impossibility, for the people in the poorer portions of the town to keep the water-closets in such order that smells should not enter the house. How defects could be possibly attended to where such carelessness and ignorance existed, was entirely a mystery to him. Replying to the accusations as to the dissemination of disease by means of the collection of miscellaneous refuse, Mr. Martineau quoted numerous statistics showing the improvement in the death-rate of the borough, especially with respect to zymotic diseases.

The discussion then closed, and a vote of thanks was accorded to Alderman Avery and the members of the committee for their kindness and courtesy to the members of the Association on the previous day.

THE SANITARY SUPERVISION OF DWELLINGS.

Mr. Lewis Angell read a paper on "The Sanitary Supervision of Dwellings." He pointed out that the demand for sanitary supervision had recently found expression in the establishment of societies for sanitary inspection on co-operative principles. The fact of the existence of such societies, be they due to philanthropy or stock-jobbing, raised the great question,—Is such sanitary supervision necessary; and, if this be granted, by whom should it be conducted? That supervision was necessary would be admitted by all who had any official experience. Thousands of houses were annually put together in a manner dangerous to the lives of the occupants, and formed a combination of contaminating influences which lower vitality and endanger life. The result is due as much to ignorance as to carelessnessness, a concourse of fortuitous evils rather than a conspiracy, although, he regretted to add, as the result of official experience, that in many instances it was also the result of the most wilful and wicked cupidity. The Local Government Board recently issued a series of model by-laws for buildings, involving very much detail. He would gladly have urged their adoption by his Board (West Ham, Essex) had he not felt there was no chance of their general observance, over a district of 7¼ square miles, with the staff at his disposal. The imposition of building fees was urged for the provision of the necessary staff, but refused to the applicants. To a condition of things such as he described, in houses new and old, were undoubtedly due the lassitude, the illness, and the deaths of thousands, whose inherent power of resistance was unequal to the fight. Having shown that sanitary supervision was needed, he urged that it was equally obvious the work should be a public and an official one, and not undertaken by amateur or stock-jobbing companies, whose philanthropy was confined to shareholders. Unlike the more advanced public opinion in America, where official factory inspection had been extended to tenement houses, the British ratepayer was not sufficiently educated in sanitary principles. He submitted that a more efficient and extended supervision of the sanitary and constructive details of all dwellings was necessary; that such supervision should be conducted by the responsible officers of the Local Sanitary Authority, and not left to private commercial enterprise; and that it was just that fees be imposed on all new buildings to provide the cost of such supervision. He declared, however, that there was more hope in education than in officialism.

Mr. E. B. Ellice Clark (Hove) said great difficulties had to be encountered before an effectual supervision could be exercised throughout the country. The Government standard of what that supervision should be had been by no means reached in all places. It would be impossible in some towns to insist on stringent sanitary provisions, however necessary; but it should be the aim of the municipal surveyor to gradually work up to the standard required. Dealing with what should be supervised, he urged that where the inspection staff is limited, the four cardinal points for supervision should be:—(1) the structure of walls, roofs, foundations, and spouts of new buildings, for securing health and stability and the prevention of fires; (2) sufficiency of space about new buildings to secure a free circulation of air; (3) ventilation and drainage of new buildings; and (4) closing of buildings, or parts of such, when unfit for human habitation, and prohibition of their use. All these points were empowered by the Public Health Act, but if the requirements of modern sanitarians were to be met there should also be subject to supervision and control the height of rooms, thickness of floors, physical conditions of the site as to floods, whether from sewers or watercourses, works necessary to be carried out in the distribution of water for dietetic purposes, and many other matters necessary to place a house in a good sanitary condition. Supervision, to be of any value, must be exact and impartial. If coercive laws were to be carried out, no discretionary power should be left in the hands of local authorities or officials, such discretion being open to serious objections. As to the probability of the detailed model by-laws being stringently enforced on the community, Mr. Ellice Clark said they might fairly assume a higher state of health, morality, and civilisation, but they must, in exercising something akin to parental control, take care that individual responsibility was not removed from the shoulders of the builders and workpeople to that of the officials. Individual responsibility brought self-reliance, and whatever restrictions were placed on buildings, or whatever supervision was exercised, it must always be borne in mind that the condition of a building is the responsibility of the builder.

Mr. J. G. Lynde (Manchester) stated that supervision, in which was included most of the points recommended by Mr. Angell, had been in force in Manchester for several years past. A certificate was given by the City Surveyor to the effect that the by-laws had been complied with before a house could be occupied. This was done without any cost to the builders, and he thought the system of fees objectionable.

Mr. Ashmead (Bristol) said that by virtue of a special Act, supervision had been increased in Bristol for many years, a special charge being made to the builders for the certificate that the conditions had been complied with.

A paper was also read by Mr. R. Vawser on "Rivers Conservancy." He expressed a belief that the present Bill for the improvement of rivers and prevention of floods is drawn with due regard to all existing and vested interests, and contains all the essential elements of a most useful measure, and as such deserves the earnest support of sanitary authorities.

On Saturday the members of the Association paid a visit to the Birmingham gasworks.

THE CORINTH CANAL.

THE concession granted to M. De Lesseps and General Türr to cut a canal through the Isthmus of Corinth has recalled the fact that this is not the first time the project has been started. The *Hora* of Athens, in an historical retrospect of former attempts, points out that the first recorded instance of the idea being seriously taken up dates back nearly 2,500 years ago. According to Diogenes Laërtius, the Tyrant Periander of Corinth, about the year 625 B.C., made some practical preparations with a view to digging a canal across the Isthmus. The scheme, however, came to nothing. At a subsequent period the same plan, according to Strabo, was revived by Demetrius Poliorcetes. He was, however, deterred from attempting its execution by the reports of his engineers who declared that the waters of the Gulf of Corinth itself stood at so much higher a level than those of the Saronic Gulf on the other side of the Isthmus that their connexion by means of the proposed canal would inevitably overwhelm and destroy Ægina and the adjacent islands. This instance of the ignorance prevailing in ancient times will appear all the more pardonable when it is remembered that similar fears for a long time contributed in recent days to discourage the attempt to pierce the Isthmuses of Suez and Panama. The next to take up the Isthmus of Corinth Canal scheme was no less a personage than Julius Cæsar. That Roman general instructed an engineer, Anienus by name, to survey the ground, and, if practicable, to carry out the work. The death of Cæsar, however, occurred before a sod was turned, and nearly a century elapsed before the plan was again revived. Suetonius tells us that the Emperor Caligula contemplated solving the problem, and actually despatched a centurion to study the *terrain* and make everything ready for beginning the excavations. Caligula, however, passed away, and nothing further was done in his reign.

It was under the Emperor Nero that the first actual digging operations were commenced. That sovereign, half genius, half madman, himself proceeded to the isthmus, and set 6,000 Jewish slaves, together with numerous gangs of convicts, to work in making the canal under his own personal supervision. The operations, however, had not been long commenced before they had to be entirely suspended owing to the formidable insurrection under Julius Vindex. The work was never resumed. The traces of the excavations commenced by Nero, nevertheless, are still visible to this day, more especially near the Diolkos. Afterwards Herodes Attious, the benefactor of Athens, designed taking up the work left undone by Nero; but in the end he was afraid, as a private gentleman, to undertake a work of such magnitude,—a work which even emperors had tried and failed at. Thus all the attempts made in ancient times came practically to nothing. The only result was to confirm the popular belief that the project was not only impracticable, but was an impiety against the gods. Tacitus speaks of those who "would pierce the isthmus with a navigable channel," as "hankering after things unheard of or past belief." The failure of all attempts was popularly attributed to the displeasure of the gods, "as is plainly evident from the result," says the historian just cited. Dio Cassius reports that at the time of Nero's attempt there were numerous terrible signs and portents, showing the disapproval of the deities. It was a widespread superstition that to endeavour to change the relations between the land and the sea as presented by Nature was nothing less than an impious attempt to disobey and thwart the will of the gods. In reference to the design once entertained by the people of Cnidus to cut through their peninsula, Herodotus reports the following as the reply given by the oracle to their inquiry on the subject: "Neither fortify nor pierce through the isthmus, for Zeus would have made it an island if he had so willed."

WORKS IN EDINBURGH.

IN order to expedite the restoration of the remainder of St. Giles's Cathedral, Dr. William Chambers (at whose cost the restoration is being carried out) has secured an iron church for the temporary use of the congregation at present occupying the nave, until such time as their new church at Meadow-place is built. The erection of the temporary church is being rapidly proceeded with, upon a site granted by the Town Council, at the east end of the Links, so that the restoration of the nave and north transept of the cathedral may not be delayed. The restoration has been entrusted to Mr. Hay, architect, who carried out the works in the choir and south transept, and a similar course is to be adopted with the remainder as was pursued in regard to these portions. The pews, galleries, and other interior fittings are to be removed, the plaster taken from the walls, and the masonry cleaned and re-dressed, and defects supplied where necessary. The walls which divide the north transept from the nave, choir, and south transept will, as a matter of course, be pulled down, so that an unobstructed view of the whole area may be obtained. The low plaster ceiling under the crossing will also disappear, and a new ceiling of uniform height with those of the nave and choir be substituted. The doors at the west end and north transept, which were the work of Mr. Burn, are to be superseded by others of new and appropriate design. The western door is to be deeply recessed, and richly moulded and carved, and divided into two by a stone pier. The northern door is to be similarly treated, and an inner porch formed by the erection of a stone screen across the whole width of the transept. The pillars and arches which support the tower are perfectly secure, but a good deal will require to be done to them in the way of restoration of detail. The mural monuments in the north transept are to be removed to suitable positions in the south aisle of the nave.

In a limited competition for a new Free Church, to be erected in Easter-road, immediately adjoining the Episcopal Chapel designed by Mr. H. J. Blanc, the designs by Mr. Charles S.

Johnston, architect, have been chosen. In this instance the committee were guided by the advice of an expert, the favourite design, we understand, having been put aside as being likely to cost considerably more than the stipulated sum. The church and adjuncts have a frontage of 70 ft., and an average depth of 115 ft. The interior of the church, consisting of nave and isles, measures 73 ft. by 47 ft., and, including the accommodation provided in a gallery at the west end, there are sittings for 750 persons. The east end is apsidal, and groined in wood. The arcades separating the nave from the aisles are formed by iron columns supporting timber arches, the spandrels of which are pierced by circles and cinquefoils; and over the arcades there is a timber clearstory, with cusp-headed windows arranged in groups of three. The west elevation consists of three parts,—central gable, tower and spire, and turret containing staircase to gallery. In the central gable there is a three-light window with geometrical tracery, beneath which is the doorway, flanked by two small windows on each side. The tower and spire terminate at a height of 85 ft., and the turret containing the stair to the gallery is finished by a gabled roof, and is separated from the main gable by a buttress. The side walls are without buttresses, and rise to a height of 16 ft. above the floor level; at the west end they are pierced by double and triple light windows above and below the gallery level, the other windows being narrow splayed and pointed openings. The estimated cost of the buildings, including a hall, 36 ft. by 26 ft., session-house, 19 ft. by 15 ft., vestry, 12 ft. by 10 ft., and other adjuncts, is 3,500*l.* The church is to be dedicated to the memory of the late popular and eloquent Dr. Thomas Guthrie.

The plans for the new portion of the Calton Gaol, prepared by Major-General Collinson, have been approved of by the Home Secretary, and the Prison Commissioners have been authorised to proceed with the construction of the buildings. The style adopted is Castellated, in unison with the existing buildings. The new works will consist of two divisions. In the one accommodation will be provided for 52 male and 87 female prisoners, and in the other for 162 male prisoners. The heating apparatus, kitchen, bakery, &c., will be placed between these two blocks. The court-yard will be increased by throwing back the boundary-wall to within 10 ft. of the outer iron railing, and a new entrance-porch will be formed, and accommodation provided for the female officials. The present west division will be altered by throwing two cells into one, by which means the Government requirement as to space will be amply met. This portion will be occupied by female prisoners, and not by males, as hitherto.

The municipal authorities having called upon sculptors to submit designs for statues and statuettes for the vacant niches in the Scott Monument, upwards of sixty competitors submitted designs. The figures are to be executed in freestone, and it has been resolved to give commissions for eight large statues, at a cost of 52*l.* 10*s.* each, and twenty-four small ones, at 25*l.* each. The following are the sculptors selected and the subjects entrusted to them:—For the large niches,—Balfour of Burleigh and the Knight Templar, W. B. Rhind; Rob Roy and Ivanhoe, John Rhind. For the small niches,—Peter Peebles and Montrose, D. W. Hutchison; Julia Mannering, George Webster; Davie Deans, Effie Deans, and Lady Avenel, J. S. Barnet; Percy Shafton, Clark Stanton; the Dougald Crater, Charles Macbride; Weyland Smith, J. S. Gibson; Gurth, W. Sheriffs; Queen Elizabeth, W. Walker; the Abbess and Caleb Balderstone, W. G. Stevenson; Rose Bradwarden, D. Buchanan; Dirk Hatteraick and Claverhouse, W. B. Rhind; Dugald Dalgetty, Ravenswood, Lady Rowena, Ritchie Moniplies, and Lucy Ashton, J. Rhind; Constance, Fraser Tytler. To Mr. Brodie, R.S.A., has been entrusted the characters of Helen Macgregor and Cromwell, for large niches; and Madge Wildfire for a small one; and to Mr. Hutchinson, R.S.A., the characters of John Knox and Charles I. for the large niches, and George Buchanan for a small one. The figures are to be delivered by the 1st of March next.

The tower of the Corn Exchange, in the Grassmarket, is to be furnished with a clock, at the cost of 90*l.*, the hours to be struck upon the bell now in the tower. The dials are to be illuminated by a self-lighting machine, adapted to suit the variation in the length of the days and nights.

It has been resolved by the Plans and Works Committee of the Town Council to make a charge of 2*s.* 6*d.* per annum upon each pole sanctioned for the erection of telephone wires. Reference was made to the probable danger incurred by such wires overhead, but no resolution was come to on the subject.

The Municipality have secured a lease of seventeen acres of ground at Merchiston for a period of five years, at a rental of 10*l.* per acre, to be used as a public park. The ground is in the neighbourhood of Fountainbridge and Dalry, where a large number of dwellings for the working-classes have been erected of late years. Much care and taste has been displayed in the planting-out of the public gardens, and the rich masses of foliage upon the trees has at present a very fine effect. Edinburgh always appears to best advantage at this season of the year. Albeit, the late east winds have been more trying than usual to feeble constitutions.

A committee of gentlemen connected with the district of Morningside have acquired the United Presbyterian Church there, which is to be vacated in the month of October next by the congregation, who remove to the large and handsome church over the way, designed by Mr. David Robertson. The church is to be converted into a literary institute, comprising a lecture-hall, library, reading-room, &c. The purchase-price of the church was 2,000*l.*, and a further sum of 2,000*l.* is to be expended upon the transformation. To Messrs. Thornton Shiells & Thomson this task has been entrusted, and, looking to the limited amount of the capital at their disposal, it seems a somewhat difficult one. The exterior walls of the church are to be retained as they are, and a floor is to be inserted half-way up, thus converting the building into two flats, the upper one being retained as the lecture-room, and the lower appropriated to the other purposes of the institute. What strikes one at first sight is the fact that a less amount of air and space seems to be considered necessary for an audience listening to a lecture on scientific than for one on religious subjects. The church is by no means of unusual height, and we do not anticipate a satisfactory result, either without or within, from the cheese-paring policy adopted.

The building of the new Conservative Club in Prince's-street has been postponed, owing to a dispute as to the ownership of a lane in rear of the site.

There is a large and very handsome church in course of erection at Tynecastle. It is for a congregation in connexion with the Establishment, at present worshipping in an iron church in the immediate vicinity. Mr. Honeyman, of Glasgow, is the architect.

We learn that another church is contemplated by the Church of Scotland for the district of Inverleith and Goldenacre. These new churches are consequent upon the increase of population in the respective districts. The number of churches in the suburbs of Edinburgh will soon be subject of remark. There seems to be no want of zeal in church-building, whatever may be said by those who should know best as to the decay of true piety.

RESTORATIONS IN ITALY.

IT is well known that in consequence of the loud remonstrances from without, as well as from those at home who are really interested in the restoration of ancient monuments in Italy, a Commission was formed last winter with De Sanctis, the then Minister of Public Instruction, at the head, and who is now replaced by Bacelli, to watch over the restorations undertaken. The work had previously been entrusted to civil engineers, men well versed, no doubt, in the mechanical work of their profession, but not necessarily men of artistic perceptions. Many travellers, having for their goal Florence or Rome, pass the interesting town of Pistoia, and miss seeing the many objects of great interest it contains,—its grand old Duomo, with endless bits of Mediæval architecture and sculpture, and its curious old pulpit on the exterior of the building, and the grandly sculptured pulpits in the churches of San Andrea and San Bartolommeo-in-Pantano, besides the picturesque town-hall, &c.

The hospital of Del Ceppo was founded about 1277. The cornice of the façade is adorned by one of the most magnificent works of Della Robbia. This work was added about 1525, and is now about to undergo restoration. The Pistoians, wishing to record the works of charity performed by their citizen-bishop, Andrea Franchi, of the Dominican order of priesthood, had this splendid ornament added to their hospital. It is one of the most splendid works of glazed terra-cotta existing, of the old Luca di Simone della Robbia work. Which of the Della Robbias was the author no existing document relates. It is generally attributed to Andrea, grandson of the old Luca, the same who, up to 1505, superintended the work of the ornaments in front of the gallery of the cathedral. He may have been aided in the work by his three sons, Luca, Giovanni, and Girolamo, since the receipt of certain sums is found in the archives of the hospital signed by Giovanni, who had paid the same to Andrea di Marchi in 1525, the time of the making of the ornament. The work represents the seven acts of charity,—clothing the naked, visiting the imprisoned, giving to eat and drink to the needy, &c. Each compartment is divided by pilasters of deep blue colour, with ornaments in high relief in white. The figures are perfectly modelled, in the highest possible relief, full of beauty and grace and touching expression. At each point where the arches that support the gallery join, are three medallions, representing the Annunciation, the coronation of the virgin, and the visit of St. Elizabeth, each surrounded by frameworks of fruit and flowers. Four figures representing Faith, Prudence, Hope, and Charity, are between the ornaments of the loggia or gallery. The arms of the Medici, of the city, and of the hospital, are discovered among the adornments. This great work of art is one of which any city may be justly proud, and it is devoutly to be hoped that the Minister Bacelli will be happy in the selection of the persons destined to superintend its restoration.

THE MINING DEATH-RATE.

THE reports of the Inspector of Mines for the past year show that the heavy mining fatalities have caused marked differences in the death-rate of the coal-yielding districts. In 1879, South Durham district had the loss of one life to every 885 persons employed at or in the mines, whilst the volume just issued shows that one life was lost for every 220 persons employed last year. Northumberland, North and East Lancashire, Derbyshire, Yorkshire, South Staffordshire, Monmouth, Scotland, and South Wales have in the year gained in safety in proportion to the number of miners employed; but in North Staffordshire, Cleveland, and one or two other districts, there has been slightly more loss of life in proportion to the persons employed. The general results are, that whilst in 1879 there were 490 persons employed in and about the coal mines of the kingdom for every life lost, last year there were 368 persons only employed for every life lost. As to the tonnage results, in 1879 there were extracted 149,400 tons of mineral for every life lost, last year 122,509 tons only being extracted for each life, the serious colliery explosions at Seaham and in the Welsh districts having chiefly caused the change. In consequence of these losses, there is for the past year one of the heaviest reports of mining mortality that has been given since the introduction of the system of inspection. Not less than 1,318 lives were lost by accident in the mines registered under the Coal Mines Act, the number for the previous year being 973. The great bulk of the increase is to be found in the fact that the lives lost by explosions of fire-damp have risen from 184 in the year 1879 to 499 last year,—the Seaham explosion contributing 164 to that number. This and other heavy losses have probably contributed to bring forward from the mine inspectors in their reports a number of opinions that will in all probability have weight in future legislation. Mr. Wynn condemns blasting in fiery mines. He says that "no care or attention which can be bestowed upon the ventilation of a fiery mine can make the use of powder at all times safe." Mr. Alexander states that the use of loose gunpowder is responsible for over 7 per cent. of the accidents that took place in the past year. Mr. Wales expresses the opinion that "all the South Wales steam coals should be worked exclusively with locked safety-lamps, and shot firing strictly prohibited." Other inspectors join in this expression of opinion, and it may be said to be substantially that of the mining inspectors. One of these gentlemen states that he has "warned the public and the authorities of this terrible danger" long and often, and that

thus the responsibility for the continuance of the system of shot-firing "rests with others." It is evident that the mining inspectors are now convinced of the folly of this most "wasteful system of coal winning," and that it rests with the public to say how long it shall continue, and how long other efforts to minimise the loss of life in coal winning shall be in some years rendered of little avail. For years there has been a gradual descent in the loss of life in the coal mines; but it has been checked by the growth of the number of lives lost by falls of the roof and sides of parts of the pit, and especially by the exceptional mortality in several years by the heavy fatalities that have occurred in different parts of the country by explosions of fire-damp, and by allied or following causes. When there is a consensus of opinion against a practice which is supposed to very materially contribute to that loss of life from that one cause, it is worth the consideration of the public whether a stop should not be put to it, and whether that "responsibility" resting on the public should not be dealt with and removed.

ORNAMENTAL AND DECORATIVE ART EXHIBITION, LISBON.

AN exhibition is to be opened in the National Museum of Fine Arts in Lisbon, of the Spanish and Portuguese ornamental and decorative arts, practised from the remotest period of antiquity to the end of the eighteenth century in those countries. In addition to the articles exhibited in the South Kensington Museum, of Spanish and Portuguese origin, there will also be exhibited others possessing the highest artistic value, belonging to various corporate bodies and private persons, which, on account of the danger of breakage and injury in their transmission to London, could not be exhibited in the South Kensington exhibition. Various other objects, which were collected by the several committees for the purpose of transmission to London, will also be exhibited on this occasion. The exhibition will also admit any articles of art existing in Portugal and Spain, without reference to their origin, provided they are works of a period anterior to the commencement of the present century. The exhibition will be opened in November next, and it will continue to the end of January, 1882. The President of the Commission of this exhibition is Prince D. Fernando II., father of the present king of Portugal, and the members who compose the Commission consist of the highest nobility and men of letters in Portugal.

PRIZES: INSTITUTION OF CIVIL ENGINEERS.

FOR some of the communications presented during the recent session, the Council of this incorporated society have just awarded premiums and prizes, arising out of various trust funds, including the following:—

For Papers read at the Ordinary Meetings.

1. George Stephenson medals and Telford premiums to Thomas Forster Brown and George Frederick Adams, MM. Inst. C.E., for their paper on, "Deep Winning of Coal in South Wales."
2. A Watt medal and a Telford premium to John Isaac Thorneycroft, M. Inst. C.E., for his paper on "Torpedo Boats and Light Yachts for High-speed Steam Navigation."
3. A Telford medal and a Telford premium to Theophilus Seyrig, M. Inst. C.E., for his paper on "Different Modes of Erecting Iron Bridges."
4. A Telford medal and a Telford premium to Max am Ende, Assoc. M. Inst. C.E., for his paper on "The Weight and Limiting Dimensions of Girder Bridges."
5. A George Stephenson medal and a Telford premium to Benjamin Baker, M. Inst. C.E., for his paper on "The Actual Lateral Pressure of Earthwork."
6. A Telford premium to Richard Henry Brunton, M. Inst. C.E., for his paper on "The Production of Paraffin and Paraffin Oils."
7. A Telford premium to Charles Colson, Assoc. M. Inst. C.E., for his Paper on "Portsmouth Dockyard Extension Works."
8. A Telford premium to Christian Hendrick Meyer, Assoc. M. Inst. C.E., for his Paper on the "Temporary Works and Plant at the Portsmouth Dockyard Extension."
9. A Telford premium to Benjamin Walker, M. Inst. C.E., for his Paper on "Machinery for Steel-making by the Bessemer and the Siemens processes."
10. The Manby premium to Joseph Prime Maxwell, Assoc. M. Inst. C.E., for his Paper on "New Zealand Government Railways."

Christmas and New Year's Cards.—A great competition in designs for such cards has been induced by Messrs. Hildesheimer & Co., and the specimens submitted are now on view at the Egyptian Hall, Piccadilly.

THE GREAT EASTERN HOTEL.

THE Great Eastern Railway Company will, in a short time, be in possession of one of the largest and most costly hotels in the metropolis. It is being erected immediately adjoining the approaches to the Liverpool-street Station, and will have a frontage to Liverpool-street of 280 ft., extending from the general offices of the Company to Bishopsgate-street, having a handsome elevation to that thoroughfare of 50 ft. in length. The preliminary excavations and the construction of the building up to the ground-line at the east end of Liverpool-street and Bishopsgate-street have formed a heavy portion of the work. In this portion of the structure there are a basement and a sub-basement, carried to a depth of 30 ft. below the pavement level. The spacious vaults for storage purposes, together with an immense kitchen, and numerous other apartments in connexion with the culinary department of the hotel, have been constructed, the walls of all these several apartments being faced with white enamelled brick. The sub-basement has a concrete floor 6 ft. in thickness, whilst the floor above it is fire-proof. In the construction of this underground portion of the hotel, upwards of a million of bricks have been used, and the superstructure is now making rapid progress. The two elevations of the hotel will be entirely in Portland and Corsehill stone. The Bishopsgate-street frontage will have a commanding appearance, containing five lofty stories above the ground-floor. There will also be a return frontage in Liverpool-street of almost equal length with the Bishopsgate-street elevation, and of uniform design. In consequence of rights of ancient lights interfering as respects some buildings at the rear, a portion of the Liverpool-street frontage will not be carried up beyond a height of between 60 ft. and 70 ft. From Liverpool-street the hotel will be carried in the direction of the station area to a depth of 114 ft., being built upon strong iron girders extending the entire width of the station itself, which the windows at the rear of the hotel will overlook. All the girders which support the superstructure will be supported by iron columns 2 ft. 6 in. in diameter, and massive piers in blue Staffordshire brick, with iron stanchions. There will be a balcony extending entirely across the station frontage of the hotel, which will be approached from the station area by two staircases from the arrival and departure platforms respectively. There will also be lifts for passengers' luggage to and from the hotel, both on the arrival and departure platforms. In about the centre of the Liverpool-street frontage an ornamental archway, 25 ft. in width, having massive carved and moulded piers in Portland stone, will lead down to a covered cab-rank on the railway level. The principal entrance to the hotel will be from the Liverpool-street frontage, the ground-floor portion of which will consist of shops, but there will likewise be another entrance in Bishopsgate-street.

The architect of the hotel is Mr. C. E. Barry, and the contractors are Messrs. Bangs & Co. Mr. W. T. Vale is clerk of the works. The iron girders across and over the line, on which the hotel will rest, were erected under the immediate superintendence of Mr. Alfred Langley, the company's engineer-in-chief.

THE NEW THEATRE IN NORTHUMBERLAND AVENUE.

AFTER remaining in abeyance for several months past, the works at Mr. Sefton Parry's new theatre in Northumberland-avenue have this week been resumed, and the building will now be actively proceeded with, and, as we are informed, will be opened before the close of the year. It may be remembered that the stoppage of the works at the theatre was owing to the action taken by the directors of the South-Eastern Railway Company, who during the time the foundations of the theatre were in course of construction, entered into negotiations with Mr. Sefton Parry for the purchase of his interest in the site, with the view of obtaining powers for the extension of their Charing-cross station in that direction. It was understood that these negotiations resulted in the company buying Mr. Sefton Parry out, but prior to their being ratified, the railway company took a course hostile to Mr. Parry, by applying to the Master of the Rolls for an injunction against his proceeding with the erection of the theatre on the ground that the construction of the foundations adjoining the railway station was undermining the west wall of that structure. The injunction was refused, with costs against the railway company, and as the company have since declined to complete the purchase bargain originally entered into, the erection of the theatre as at first intended follows. It is to have elevations to Northumberland-avenue and the Embankment, the latter being circular in form.

Messrs. Fowler & Hill are the architects of the theatre; and Messrs. Kirk & Randall the contractors.

ARCHITECTURAL SCHOOL, ROYAL ACADEMY.

THE following were admitted, July, 1881, to the Architectural School:—

To Upper School.—F. B. Bare, W. Bucknall, J. H. Curry, B. Dickson, E. G. Hardy, W. H. Lethaby, G. H. Saackie.

To Lower School.—G. Blizard, G. C. Horsley, H. H. Kemp, A. Kent, A. Leslie, H. W. K. Martin, H. G. Nixon, H. Read, T. Sims, J. A. Slater, R. E. Smith, C. H. Stock, W. Toogood.

Probationers.—G. W. M. Addison, E. T. Blomfield, W. M. H. Burkitt, F. Dickenson, H. Field, E. A. Jackson, F. Johnson, G. E. T. Laurence, T. Maclaren, G. T. Oakeshott, S. Gambier Parry, F. Landers, A. D. Smith, Kingo Tatsuno, Thomas Ward.

COMPETITIONS.

Corporation Market, Birmingham. — The limited competition for new buildings in connexion with Smithfield Market, St. Martin's-lane, has now been decided. The competing architects were Messrs. Osborn & Reading, Messrs. Bland & Cossins, and Messrs. Martin & Chamberlain. The design submitted by Messrs. Osborn & Reading has been selected.

Forest of Dean Board Schools.—In the competition for Steam Mills Schools, Forest of Dean, Gloucestershire, for 416 children, Joys Green Schools for 274 children, and a separate teacher's residence, the designs of Mr. Alfred Smith have been accepted by the Forest of Dean U.D. School Board for the above works. They have been passed by the Education Department, and are to be proceeded with at once.

PROPOSED TOWN-HALL FOR EASTBOURNE.

AT the last meeting of the Eastbourne Local Board,—

Mr. Schmidt, building surveyor, produced plans for a town-hall at Stock's-bank, to cost about 13,000*l*. One of the principal features is a county court-room, but there are also a board-room and offices. The plan had been submitted to Judge Martineau, who affirmed the same with a few slight alterations.

The question arose whether a portion of the building should be put up first, or the whole work carried out at once. The latter view appeared to be the most general, and on the motion of the Rev. E. E. Crake, it was resolved to invite tenders for the work, and to apply for powers to borrow the additional sum required beyond what the Board has in hand.

A CURIOUS CASE UNDER THE METROPOLITAN BUILDING ACT.

A SOMEWHAT singular case, as illustrating the difficulties arising from rash and ignorant tampering with houses by their tenants, was heard at the Marylebone Police-Court a few days back.

It appeared, from the statement of the district surveyor, Mr. Wallen, that Mr. Dart, of 100, Park-street, Camden Town, had caused an erection or additional story to be built on the flat of the one story addition at the rear of that house, which adjoined another addition also one story high at the rear of No. 101. The district surveyor required that this addition should have a wall on the side next to No. 101, or, in other words, that the party-wall should be carried up above it. This was accordingly done, and the building duly passed. Thereupon the owner or lessee of No. 101 threatened Mr. Dart with legal proceedings for obstruction of light to his rear buildings owing to the new addition at No. 100; and for trespass in raising on the wall which he claimed as his; and Mr. Dart, in the hope of meeting his objection, sent for Mr. Soper, a builder living

close at hand, and desired him to pull down the wall that the district surveyor had required to be raised, and this he accordingly did, without notice to the district surveyor. Then Mr. Dart, wanting an inclosure, put up with his own hands some thin wooden boarding. The district surveyor afterwards discovering the change that had been made, served Mr. Soper with notice to restore the wall, waiving (on Mr. Soper's representation of inadvertence) the penalty for neglect to give notice. A summons was granted, and an order to restore the wall made by the magistrate. Mr. Soper, however, on account of the difficulty of the adjoining owner above referred to, proposed to remove the new erection altogether. But here Mr. Dart found a fresh difficulty in the fact that he had just executed the counterpart of a new lease, under which he was bound to maintain the new erection intact. Mr. Dart, therefore, refused to allow Mr. Soper to enter his premises in order to comply with the magistrates' order, and the latter appealed to the district surveyor, who thereupon commenced proceedings against Mr. Dart for the erection by him of the wooden enclosure. A notice was accordingly served on him to substitute brickwork, and, on failure to comply, a summons was taken out against him. Meantime the action with the adjoining owner came before the Court of Queen's Bench, and is referred to arbitration, and the magistrate adjourned the summons against Mr. Dart pending the decision thereon. Then the accident happened which the regulation, sought to be enforced by the district surveyor, was intended to prevent. A fire occurred at the rear of No. 101, which, owing to the absence of the wall in question, communicated itself to the erection on Mr. Dart's roof, entirely destroying it, and doing considerable damage to the main part of the house, which narrowly escaped destruction.

The adjourned summons against Mr. Dart, and a fresh one taken out by the district surveyor against Mr. Soper for non-compliance with the magistrate's order, was heard on Wednesday, the 22nd ult., when the district surveyor said, as regarded the former, he could hardly proceed—the cause of complaint being destroyed—but suggested that a fine should be inflicted on Mr. Soper for non-compliance with the magistrate's order under the latter summons (which he could recover from Mr. Dart) for the folly and recklessness which had produced the disaster.

Mr. W. M. Miller, solicitor, who appeared for Mr. Dart, pleaded, however, that he was inadequately insured, and would already suffer, whereupon Mr. de Rutzen expressed an opinion that, under all the circumstances, the summons might be withdrawn on payment of costs.

Mr. Dart, however, is still as far from being relieved of the difficulty into which he has got himself as ever. If he does not restore the erection, he forfeits his lease. If he does, the district surveyor immediately requires the raising of the wall, and he is still liable to the proceedings taken against him by the adjoining owner.

The whole should be a warning to shopkeepers and others, who take property on lease, not to tamper with their buildings, as they are so frequently apt to do, without taking proper advice as to the responsibilities they are incurring, or carefully considering the consequences of their actions.

PATENT RECORD.*

ABRIDGMENTS OF SPECIFICATIONS

Published during the Week ending July 2, 1881.

4,153. R. W. Gossage, Deptford. Adjustable apparatus for regulating the position of doors and windows.

This is applicable to windows of the kind termed "French," that open like doors. A cylinder is screwed to the door, within which is a piston actuated by a spiral spring. A spindle is attached to the piston which passes through the inner end of the cylinder, on the end of which is an adjustable nut. A double-armed lever is hinged to the door-post, and the ends of the arms come to the sides of the cylinder, through which they are connected together by a pin, which is made to act on the piston. The position of the door or window, when partly open, is thus regulated by the adjustable nut. Oct. 13th, 1880. Price 6d.

4,177. E. Taylor, Blackburn. Appliance for fire-grates for consuming smoke, &c.

A perforated plate is placed in the flue above the fire in a diagonal position towards the back of the fire, which, becoming hot, burns the smoke as it passes away from the fire, and increases the heat by intercepting it from going up the flue. Oct. 14, 1880. Price 6d.

4,634. J. Jobson, Derby. Open fireplaces.

The back, bottom, and sides are formed of fire-bricks. Passages are made through these, by which air is led to mix with the smoke and consume it. Nov. 11, 1880. Price 8d.

4,714. J. M. Tall, Dulwich. Concrete buildings.

This uses a combination of slabs and blocks formed of concrete. The slabs are made with an enlargement on two opposite edges, and a groove is formed within them. The blocks also have a groove along two edges. When they are placed in position, a grouting of cement is poured into the groove at the joints and allowed to harden. Nov. 16, 1881. Price 8d.

4,752. J. Holgate, Burnley. Cutting or dressing stone, &c.

The stone is placed on a travelling table, and cylinders, which revolve in the same direction, are used to carry different cutters, whereby the stone is cut and dressed in one operation. The cylinders are so geared that they can be raised or lowered together or separately, and the table is made to travel at whatever speed is required. Nov. 18, 1880. Price 6d.

4,761. H. Thompson, Islington. Domestic grates or stoves.

The main portion of the grate being formed in the usual manner, the front bars are made to move vertically in grooves at the sides. The bottom bar has a slot, through which is passed a flat plate, when the whole of the bars and the plate are raised, leaving a space at the bottom of the fire in which fresh fuel may be placed, when the plate is withdrawn, and the bars allowed to drop into their normal positions. Nov. 18, 1880. Price 6d.

4,832. E. Young, Steyning. Wooden pavements.

To prevent horses slipping upon wooden pavements, a nail or spike, on which is a washer, is driven into the upper surface of each block. The washer prevents the nail being driven into the wood, and the head of the nail affords a firm foothold to horses. Nov. 23, 1881. Price 4d.

4,845. W. R. Lake, Southampton Buildings. Furnace or fireplaces.

Air pipes are provided, having their inlet openings in the outer air, which are led into the flue or chimney to receive the heat passing up, and are then coiled round the fire and open into the fire chamber by long narrow mouths, arranged at an angle to the direction of the draught, whereby the smoke and gases are consumed. Several different arrangements for the pipes are shown. (Com. by J. Wolstenholme, Buffalo, U.S.A.) Nov. 22, 1880. Price 6d.

4,853. J. Lovegrove, Lower Clapton. Sewer and drain pipes.

An overflow passage is formed along on the top of the drain, with which it is in communication by small openings. When an obstruction takes place in the pipe, the water will escape upwards into the overflow passage, and after passing the obstruction will flow downwards into the pipe and pass away. In convenient positions along the drain, shafts, partly vertical and partly curved, are placed, divided by two divisions, into three spaces. The two outer divisions are connected by curved pipes to the drain, so that bamboo cane rods can be passed down. The centre space is vertical, and can be used for examination of the drain, &c. Syphon-traps are used for the drain inlets. Nov. 23, 1880. Price 6d.

4,896. H. Hunt, Newington. Combined blower and fire-guard.

A frame is made to fit the fireplace, hinged as required, and transparent mica or talc is inserted therein. Adjustable slides are provided, so that it may be withdrawn a little and act as a fire-guard. (*Pro. pro.*) Nov. 25, 1880. Price 2d

4,916. W. H. Settle, Horncastle. Manufacture of mosaic or ornamental slabs, tiles, tablets, &c.

A number of glass beads or other suitable materials are secured together by wire, and bedded in a cement backing, which forms the body of the slab, &c. (*Pro. pro.*) Nov. 25, 1880. Price 2d.

* Compiled by Hart & Co., Patent Agents, 28, New Bridge-street, E.C. It is not the fault of Messrs. Hart & Co. that this list has fallen behind-hand.

SANITARY PLUMBING: GULLIES.

SIR,—I have read with great interest Mr. Hellyer's lectures on "Sanitary Plumbing," as reported in the *Builder*, more especially the one on "Traps and Trap-Ventilation," and I fully agree with him in most that he has hitherto said; but I cannot follow him in all that he says respecting the disconnexion of sinks, waste-pipes, &c., and in his sweeping condemnation of the gullies now so generally used for that purpose. Besides, in condemning the Mansergh trap (which, by-the-by, is liked by some eminent sanitarians), Mr. Hellyer condemns all traps or gullies that are not what he terms self-cleansing; but as they are recommended for the disconnexion of sinks, &c., by the great majority of surveyors and engineers, and as they are also recommended in the "Model By-laws" recently issued by the Local Government Board, and as I have seen some thousands fixed which answer their purpose in every particular, I cannot allow Mr. Hellyer's individual opinion to outweigh my own experience and the opinion of so many eminent and practical sanitary engineers. Of course, the construction of a gully is such that there *must* be a certain space where sediment can subside, and there is no doubt that this deposit is not removed so often as it should be from ordinary gullies, but there are some with a movable bottom, which reduces this evil to a minimum; but I am of opinion that it is not an unmixed evil, for there is always a certain quantity of grease and soapy matters from a sink, which, although they will not subside by themselves, are dragged down to the bottom by silth and heavier matters. Mr. Hellyer admits that for yard *detritus* the gully is the proper thing, but when a trap with an open grid is placed outside a house to receive the discharge from the sinks, it more often than not has to serve as a yard gully also.

With respect to self-cleansing traps. I have never yet had the pleasure of seeing one that would really be self-cleansing placed between the sink and the sewer. I can understand that a syphon-trap, with a slow bend, properly fixed, would probably be self-cleansing if the discharge into it could be always direct and in fair quantities, so as to flush it at every discharge, but it is not so in practice. Sometimes there is only a little trickling down, very seldom a flush; the consequence is that there is soon a deposit composed of silth and grease which no flushing you can give it from the sink or grid can remove. Why, even a drain itself, laid properly and at an even gradient, and without the intervention of a trap or syphon, if that gradient is slow, and there is any quantity of fat, will often choke sooner or later. I have seen scores of pipes and syphons taken up choked with grease and silth where there has been no fault in laying them. At a meeting of the Royal Institute of British Architects, some time in 1877, the question of grease in drains was thoroughly discussed, and Field's flush tank and Dean's gully were recommended by some speakers. I consider Field's flush tank to be the simplest and most perfect thing to use where there is a quantity of grease, and Dean's trap possesses great advantages over the ordinary gully. There are numerous other gullies also which I do not think should be so thoroughly condemned without the chance of a reply, and I think with some of your correspondents that it would be very satisfactory if some arrangements could be made for a general discussion upon the whole of the papers. CHRYSTABEL.

REFUSAL TO PAY ON ARCHITECT'S CERTIFICATE.

LOVELL *v.* CHAMBERS.

In the Queen's Bench Division of the High Court of Justice, Westminster, a few days since, the case of Lovell *v.* Chambers came before Mr. Justice Lindley and a special jury. It was an action to recover the balance of an account under a contract.

Mr. Butt, Q.C., in opening the case of the plaintiff, said his client was a builder and contractor carrying on business at Great Marlow, in the county of Buckingham, and the defendant was a barrister residing at the same place. In 1877 the defendant engaged the plaintiff to pull down an old house known as Beechwood, at Great Marlow, and build him a new one. The claim of the plaintiff was for a balance of money due under the contract, and for extra work amounting to 1,171*l.* 17*s.* 10*d.* The total sum due under the contract, including the value of old materials, was 4,650*l.*, and, under the contract it was agreed that the builder's claim should be assessed from time to time by an architect, who, as was usual in all such cases, had power to order anything to be pulled down, and under the contract to give certificates to the plaintiff as the work progressed. The architect had thus been employed by the defendant, and the main defence to the action now appeared to be that the defendant disputed the work, which had been approved by his own architect. He (Mr. Butt) maintained that the defendant could not shirk his liability on that ground. A sum of 4,480*l.* had been paid under the contract, and the work was continued. On the 5th of September, 1879, the architect, Mr. Pope, gave a certificate to the plaintiff for 50*l.*, but the defendant refused to pay the amount, and it was only when the action had been brought that the money was paid into court. On the 21st of September the architect gave a further certificate for 87*l.*, but under the terms of the contract only half of that amount was due at the time, and consequently the plaintiff sent in his claim to the defendant for 43*l.* under the second certificate. Therefore the total claim of the plaintiff up to that time was for 93*l.* The defendant still refused to pay anything to the plaintiff, who in the meantime had to make heavy disbursements for materials supplied in respect of the works he had undertaken for the defendant. The only course which was then open to the plaintiff was to issue a writ, which he did, for the amount due, and as other sums became due to issue two other writs. The total amount which the plaintiff now sought to recover was 1,174*l.* 17*s.* 10*d.*

Evidence was called in support of the learned counsel's statement, the architect denoting that the work had been carried out to his entire satisfaction.

Mr. Finlay, on behalf of the defendant, informed the Court and the jury that behind the minor points of defence, the chief contention on behalf of his client would be that the architect had certified for the plaintiff's work to an exorbitant amount, and beyond that to which he was entitled.

The jury gave a verdict for the plaintiff for the amount claimed, with interest, less a sum of 142*l.* paid into Court

THE ENGLISH LAND SYSTEM.

SIR,—Granted that the laws of entail should be revised, and primogeniture done away with, as they ought to be, I allow, your correspondent is in error in supposing that it would lead to peasant farming. Estates mostly pass by "settlement," seldom by "entail," and never, as a rule, through "intestacy," as any country lawyer will tell you; otherwise, how is it that in counties where primogeniture does not exist the land is not in more hands than elsewhere?

It is a proper system of registration of titles that is the *sine quâ non* of all land reforms. I thought the idea of a peasant proprietorship on the French system for England had long been exploded. They have a better climate (although, no doubt, for all sound farming, the statement of a well-known M.P., that ours was the finest climate in the world, contains truth, notwithstanding the roars of laughter it gave rise to when made), a more fertile soil naturally, and a most frugal people. If it paid, there would be plenty of small owners and farmers in this country; but it does not.

Forty years ago there were in my parish,—a very small agricultural one,—six yeomen, that is, men living on and farming their own freehold land, and probably by going further back you would find there were many more such. Now there is only one left, and he has let his land to an adjoining farmer, instead of working it himself. If it paid, why did all these hard-working, practical men give up, particularly as in this case there was no squire or rich neighbour to buy them out at a fancy price? As nearly every purely agricultural parish in England gives, I believe, more or less similar results, it seems useless to think of peasant proprietorship. My impression is this,—in a corn, cattle, sheep, and dairy country,—in fruit, poultry, and garden produce we cannot now compete with more southern countries. If your correspondent can give practical proofs that we can, throughout England, he will be a public benefactor, as in my neighbourhood, even the poors' lands, free of rent and all restrictions, find no cultivators, they tell me.

A HAMPSHIRE MAN.

WOOD PAVEMENT.

SIR,—I have a washing-down place to pave in wood blocks. Will some one kindly say the size generally used in London; and if bedded in cement joints, should they be done in Sir William Barnett & Co.'s patent process?

S. P.

CHURCH-BUILDING NEWS.

North Curry.—The parish church of North Carry is being restored under the immediate direction of Mr. John Oldrid Scott, as regards its nave, aisle, and transepts; and as to the chancel, from the designs of Mr. Ewan Christian, the architect to the Ecclesiastical Commissioners. North Curry Church is a particularly interesting one, and has a central octagonal tower, which is a most unique feature. The church stands in the midst of a graveyard, in which are the remains of a good ancient cross. One point of exceptional interest about the building is the excellent groining under the tower. The work is now being rapidly pushed forward, and it is hoped that in a few months the renovated building will be ready for re-use. Mr. Trask, of Norton-sub-Hamdon, is the contractor; the carved stone work is by Mr. Harry Hems, of Exeter; and Mr. G. Hannaford is the clerk of the works.

Stockton (*Wilts*).—The parish church of Stockton, near Codford St. Mary, Wilts, is a very interesting example of transition Norman in the nave, Early English in the lower part of the west tower, and fifteenth century for the clearstory to nave and to the aisles. The chancel is Early English, with a peculiar east window of the transition between Early English and Decorated. It has a vesica placed horizontally in the head, an almost unique example, it is believed. Then the iconostasis arrangement of the Greek Church in an English building is curious,—a mere chancel doorway and no arch, with hagioscopes on each side, all of the Early English period. The west chancel wall seems to have been built not on the lines of the original Norman chancel-arch, but further westward, so that the last small bay of the nave arcade is partly built into it. The north nave aisle contains an elaborate Elizabethan monument to John Topp, a great local benefactor. In the south aisle is a remarkable mural tomb of the thirteenth century, containing the effigy of a lady lying on her side. The upper part of the tower is fifteenth-century work. The north aisle has practically been rebuilt, the church re-seated with wainscot benches, the nave and aisle roof renewed and covered with lead, the tower underpinned and strengthened, a proper choir arrangement made, with handsome oak seats. The windows have also partly been filled with stained glass. The total cost (exclusive of decorative work) has been upwards of 1,800*l.* The architects were the late Mr. Ferrey, F.S.A., and Mr. Edmund B. Ferrey. The works were not carried out by contract, but by different tradesmen.

ROMAN CATHOLIC CHURCH-BUILDING NEWS.

West Drayton.—The Chapel of the Sacred Heart of Jesus, in St. Catharine's (R. C.) Church, West Drayton, has just been completed by the erection of an altar and reredos. The altar is of the open form, supported in the front by columns. The reredos occupies the whole width of the chapel, reaching nearly to the ceiling, and is enriched by a statue of our Lord sculptured in white alabaster, and by paintings by Mr. J. Bouvier of St. John the Evangelist and St. Margaret Mary. The materials are Caen stone and alabaster, style English, fourteenth century. The work was executed by Mr. G. F. Anstey. The side-screens of the Chapel of the Sacred Heart and of the Lady-chapel are of stone, forming integral portions of the structure, and they have been completed to the design of the architect by the execution of the carving, and of two sculptured panels, representing the Annunciation and the Agony in the Garden. A font of Caen stone has been placed in the baptistery. It is octangular on plan. Seven sides are occupied by carved emblems of the Passion; the eighth by a niche, containing the representation of the Baptism of our Lord. The font and carving to the screens were executed by Mr. McCulloch. The whole has been carried out from the designs and under the superintendence of Mr. S. J. Nicholl, architect, Caversham-road. The window of the baptistery has been filled with stained glass, executed by Messrs. Lavers, Barraud, & Westlake.

VARIORUM.

THE new edition of Walker's "Aristology, or the Art of Dining," to which we referred in our last when speaking of a "Novel Banquet," is edited and annotated by "Felix Summerly," and published by George Bell & Sons. *Ariston* is Greek for dinner, and that explains Walker's title given to a little book which may be read with as much pleasure and profit now as when he wrote it in 1835. If it be true that, as Brillat Savarin says, "the fate of nations depends upon how they are fed," more and more thought should be directed to the cookery question. The editor has supplied some capital notes, and for our own sake we hope all who may intend at any time to ask us to dinner will read it.——The *Welcome*, for July, one of Messrs. Partridge's magazines for the home circle, includes an interesting memoir of President Garfield (with a good portrait), written before the recent infamous attempt to murder him. His career has been remarkable; his origin so lowly that he was four years old before he had a shoe on his foot. Ultimately he got to college, and his course afterwards was always upwards.——The *Leisure Hour* gives some particulars of the waste-paper trade. "In London the number of wholesale dealers in waste-paper is about fifty, and the extent of the business of some of these is enormous. Two years ago the waste of the Government Stationery Office alone was valued at nearly 34,000*l.* We hope there is some diminution now, after attention has been called to the abuse, for assuredly this vast sum brought unfair perquisites to some pockets at the cost of the nation. The first process in the utilisation of waste-paper is necessarily its collection. This, in London, is principly effected by the agency of the marine-store dealers. They number some 600, and derive their supplies from all sorts of miscellaneous sources. Servants who take the paper as their perquisites, charwomen, office-cleaners, children anxious to earn a penny, thieves, frugal housewives, and the miserable individuals who, with downcast gaze, prowl the streets in search of scraps of any kind, all act as jackals to these waste-paper lions. But of late years there has been established a superior class of dealers, who buy waste-paper in large or small quantities, and send their vans to collect when the quantities are considerable and the distance is not too great. When the vendors reside in the country, sacks are sent to pack it in, and the paper may be returned either by rail or carrier, being paid for either by cheque or post-office order. Small quantities may be brought to the offices and paid for on the spot. Looking over the books of a very large and respectable dealer in this article, we find amongst his *clientèle* peeresses, bishops, colonels, clergymen, and persons of every degree; while parcels come from Sutherlandshire in the north to St. Leonards in the south, and from Cornwall in the west to Yarmouth in the east. The transactions range from 3d. to 1,700*l.*,—the former sum being paid to a little street waif, and the latter for the waste of a railway company."

Miscellanea.

Sutton Bridge Dock.—Lord Colville, Mr. Tennant, Mr. Joseph Shuttleworth, and other directors of the Great Northern Railway, together with Messrs. English, of Peterborough and Wisbech; Mr. Thorold, of Sutton Bridge; and other directors of the Dock Company, have held a consultation with Sir John Coode, C.E.; Mr. John Fowler, C.E.; Mr. Johnson, C.E., and Mr. Brunlees, C.E., on the steps to be taken to restore the Sutton Bridge Dock works. It was ascertained that no further damage of any consequence has accrued to the walls of the basin, while the massive lock-walls and invert betray no sign of settlement or injury. A few days ago it was discovered that water from the dock-basin, which is 13 acres in extent, had found its way under the foundation of the lock, and was scouring from under it the silt or sand upon which it is built, and issuing into the river. This was considered surprising, seeing that the length of the subterranean channel so excavated must be at least 300 ft., that being the distance between the front of the apron of the dock and of the lock and the edge of the apron at the river end of the lock. At low-water spring-tides the difference in level between the water in the dock-basin and that in the river outside is 24 ft.; and the powerful hydrostatic pressure of this head has to be sustained by the lock-gates, by the abutments and foundations of the lock, and by the stratum of soil which underlies the foundation. The silt, a mixture of fine sand with a small proportion of clay and the minute shelly envelopes of animalculæ, is so porous and easily transportable by water, that a slight percolation of water through it quickly erodes the soft material, and establishes a continuous current, and a trifling issue of water through a crevice will in perhaps a single hour undermine and burst up the most solid brickwork structure. This forms a remarkably difficult soil in which to construct a lock or a sluice. Engineers pronounce it treacherous, and deep scouring away of a foundation such as this at Sutton Bridge is said to be unforeseen, and an accident which no professional skill could possibly prevent. Local authorities, however, who have had extensive practice in embanking and sluice-building in this unstable silt, take a very different view. They maintain that silt is an admirable base on which to build, provided it be properly treated. It remains firm, and will support any weight, so long as no current is permitted to flow through it from a body of water having power to enlarge the volume of that current.

Shops, Albany-road, Camberwell. — A number of shops and houses have recently been erected on a portion of an estate belonging to Mr. A Stedall. The upper floors are arranged on the flat system; the fronts are faced with Suffolk bricks, the cornices, strings, and moulded reveals of windows being formed with moulded bricks; the pilasters, trusses, spandrels under arches of windows, &c., are in Box ground Bath stone. Mr. G. Green, of Clapton, is the general contractor; Messrs. Francis & Co. supplied the revolving shutters; the carving was done by Mr. J. Wormleighton; Mr. George Edwards is the architect.

The Memorial to the Late Sir Gilbert Scott.—The memorial brass which has been deposited in Westminster Abbey over the grave of the late Sir Gilbert Scott was uncovered on Wednesday by Archdeacon Jennings, in the absence of Dean Stanley, who was prevented by illness from performing the ceromony.

Strike of Deal Carriers in Gloucester.—A further difficulty has been raised in connexion with the already sufficiently depressed state of the trade of the port of Gloucester, by an unfortunate strike amongst deal carriers employed there. The following printed notice, in consequence of the continued depression in trade, was posted about the Docks a short time ago:—"The timber importers of Gloucester hereby give notice that on and after 1st July next, the rate of wages will be 3s. 6d. per day for day-work, and the piece tariff will be as under: For all deals, battens, and scantling (pitch-pine excepted) dropped within 30 ft. of the inner rail of the Midland Railway Company—deals, battens, and scantling per standard, 2s.; boards per standard, 2s. 6d. Ditto, piled up to, and within fifty yards of the inner rails, as above—deals, battens, and scantling per standard, 2s. 6d.; boards per standard, 3s. 3d., 3d. per standard extra for every additional twenty-five yards beyond the fifty yards above mentioned. Gloucester, June 20th, 1881." The men regarded this as a breach of an arrangement come to two years ago, whereby they were to be paid 3s. 6d. per day during the months between September and July, and 4s. a day in July and August. The consequence was that early on Monday the deal carriers employed by Messrs. Price & Co., Nicks & Co., Barkworth & Spaldin, Booth & Co., and T. Adams & Co., numbering about 300 in all, struck work for the extra 6d. a day. Some few men who continued work were induced to join the great majority about mid-day. The men gathered by a vessel which was being discharged for Messrs. Adams by men on piece-work, and they also struck. The masters met a deputation from the men, when they offered to concede the 4s. a day, on condition of the men accepting a reduction of 6d. per standard on piece-work. The men rejected this.

A Concrete Railway Platform—Mr. J. B. Fraser, architect to the Great Northern Railway for the Leeds District, and Mr. Charles Trubshaw, architect for the Northern Division of the Midland Railway, attended with other gentlemen, by invitation, in an enclosed yard in Grace-street, Leeds, to witness the trial of a section of railway platform constructed on a new plan. The section, which was 18 ft. broad and 9 ft. long, was made on the 16th of December last, by Mr. Alfred Walker, maker of concrete pavement and fireproof floors. In contra-distinction to the old style of platform, that inspected was made entirely of concrete. There were five piers running lengthwise along the platform, and on these were placed the floor, which has a facing of granite concrete, all the other portion being of concrete made from the Aire-side slag. The platforms are constructed, as all builders will know, in a moist state, and sets of iron girders, 2 in. in breadth, are imbedded in the concrete to give it greater coherence. Twenty tons of pig-iron, brought from the Aireside Foundry, Hunslet, were provided. Fifteen tons of this material were piled upon a portion of the platform, 3 ft. square, and no sign of fracture was apparent; indeed, Mr. Leonard Cooper, of the above-named foundry, who was also in attendance, stated that in his opinion the platform was strong enough to bear, on the same space, a pressure of forty tons.

Failures in the Building and Allied Trades during the past Six Months.—Mr. Richard Seyd has compiled some statistics of failures in the United Kingdom during the first half of 1881. The number of failures announced in the first half of the year 1881 has been 6,279, of which 690 are in the financial, wholesale, and manufacturing branches of trade, and 5,580 in retail trade, professional pursuits, builders, publicans, among the working classes, &c. The failures in the wholesale trades included:—Engineers, founders, iron, metal, and hardware merchants, 121; and timber trade, 17. In retail trades, &c., the failures included,—Auctioneers, house-agents, and surveyors, 68; blacksmiths, 35; brickmakers, 33; builders, architects, &c., 304; cabinetmakers, upholsterers, furniture, &c., makers, 74; carpenters, joiners, wheelwrights, 132; labourers, bricklayers, slaters, &c., 82; lime burners, 2; masons, 55; plumbers, painters, gasfitters, 139; and timber dealers and sawyers, 11.

Technical Education.—The Prince of Wales, who is President of the City and Guilds of London Institute for the Advancement of Technical Education, has consented to lay the foundation-stone of the Central Institution, in Exhibition-road, South Kensington, on the afternoon of Monday next, July 18th.

The Importance of Sanitary Knowledge to Young Architects.—Last week Mr. H. Masters read a paper before the Junior Architects' Society, at the Fine Arts Academy, Bristol, in the course of which he advised the young architect to take every opportunity of observing the intelligent and the slovenly workmen in their work, and to judge for himself as to the correct mode of executing works, and not to be satisfied by following strictly the text-books, but rather to think for himself; and he pointed out some of the errors in the published model specifications. A reference was made to the mode of drainage adopted by the designers of Mediæval buildings, and also to the advice given by Vitruvius in relation to drainage and the selection of healthy sites for dwellings. Defects in the drainage of the modern builders' houses were pointed out, and it was urged that costly, elaborate systems were often introduced, to the exclusion of more simple, inexpensive, and scientific modes; examples of defective sanitation were shown by drawings, and remedies suggested. In closing, the speaker drew attention to the multiplicity of small, so-called ventilating pipes which might be seen upon a large number of the houses of Bristol, Clifton, and elsewhere, and they would find, upon investigation, that such contrivances in a large number of instances were ineffective, in consequence of being put up by those who were ignorant of the simplest principles that govern the motion of air. Such contrivances erected in ignorance gave a sense of security, but were often a delusion and a snare.

The Vyrnwy Waterworks for Liverpool. On Thursday last the first stone of the Vyrnwy waterworks was laid by the Earl of Powis. The Lake Vyrnwy will be formed by the construction of a masonry embankment across the south-eastern end of the Upper Vyrnwy Valley; the length of the lake will be 4¾ miles; area of lake, 1,115 acres; contents of the lake, above the level at which the water will be drawn for the supply of Liverpool, 11,900,000,000 gallons; available drainage area contributing to the lake, 22,000 acres; length of masonry embankment from rock to rock, 1,255 ft.; height of masonry embankment from lowest part of rock foundation to coping of parapet, 139 ft.; height of masonry embankment from river level to coping of parapet, 98 ft.; length of contributing tunnel from river Marchnant to lake, about 1⅞ miles; length of contributing tunnel from river Cowny to lake, about 1¼ miles. The length of the aqueduct from the Lake Vyrnwy to the reservoirs of the Liverpool Corporation at Prescot will be 67 miles; this aqueduct will consist of a triple line of pipes and of three tunnels, two of seven-eighths of a mile and one of 2¼ miles in extent. On the line of aqueduct there will be several filter-beds and minor reservoirs. It is estimated that the daily water supply to Liverpool from this source will be (including compensation) 52,000,000 gallons.

The Indian Public Works Department. In the House of Commons on Monday last, Mr. Carbutt asked the Secretary of State for India whether any scheme for the re-organisation of the Indian Public Works Department was under contemplation, and whether it would in due course be laid before the House; and whether due consideration would in any such scheme be given to the frequent requests from the Civil Engineers in the service for an amelioration of their pension rules, and for equality of treatment generally with the officers of the Royal Engineers in the same service. The Marquis of Hartington, in reply, said: The question of re-organising the Engineering branch of the Public Works Department in India is now receiving the consideration of the Home Government, and due attention will be given to representations which have been made in respect to the pension rules and to the position generally of the officers of the department. The question will form the subject of communication between the Secretary of State and the Government of India, and when a scheme has been settled there will be no objection to lay the same before the House.

The Beaconsfield Memorial.—A site has finally been decided upon in Westminster Abbey for the national memorial to the late Earl of Beaconsfield. The spot selected is in the north aisle, on the pillar just beyond the memorial to Sir Robert Peel. The work will shortly be commenced.

Ipswich.—The new lock to the Ipswich Dock, the new Post-office, and the new Museum are to be opened on the 27th of July.

Ashburnham House.—A meeting of old "Westminsters" was held on the 11th inst. at the rooms of the Royal Asiatic Society, Albemarle-street, to protest against the proposed exchange of Ashburnham-house, standing on ground measuring 10,000 square feet, for another only covering 4,000 square feet. It was explained that by the Public Schools Act of 1868 a governing body was substituted for the government of the Dean and Chapter, and with this change also came a separation of property—15,000*l.* was handed over, together with 3,500*l.* annuity from the Commissioners, and four houses were given. The house in question was the residence of Lord Thynne, and was supposed to be built by Inigo Jones, and it was alleged by the Dean that as such it ought to be preserved as a public Art treasure, but if it remained the residence of a canon it would be less available than at present for public inspection. It was contended that as the influence of the Dean and Chapter was predominant on the governing body, that body no longer represented the interests of the school in matters between the two bodies. It was arranged that the Charity Commissioners should be asked to withhold their sanction to the proposed transfer, and a deputation was appointed to see the Commissioners on the subject.

The Proposed Removal of the Royal Mint. The Select Committee to whom the London City Lands (Thames Embankment) Bill was referred, have unanimously reported adversely to the measure. By the Bill thus rejected, the Corporation proposed to sell to the Government three acres of land on the site of the City gas-works, for 254,475*l.*, as a site for the proposed new Mint, and to purchase of the Government the site of the old Bankruptcy Court in Basinghall-street for 93,400*l.* It was estimated that the new Mint buildings would cost 110,000*l.* The committee are of opinion that there is no ground to justify this large expenditure. They think that the present Mint buildings, with some inconsiderable alterations, and with additional machinery for rolling the metals which may be placed in the room now occupied by the obsolete and disused machinery for cutting out, and with improved motive power, may, within a very reasonable period, and for a moderate outlay, be made adequate for a coinage at least as large as that contemplated in the new Mint.

The City Churches.—In the House of Lords, on Monday, the Earl of Onslow moved "That an humble address be presented to her Majesty praying that her Majesty will be graciously pleased to issue a Commission to inquire into the working of the Union of Benefices Act, 1860, and the state of the several ecclesiastical parishes in the City of London with reference to their population and to the value of the benefices attached to them, with a view to the suggestion of such further union of benefices, disposal of the site of churches, and application of the funds arising therefrom as may, with due regard to the architectural and historical features of the existing edifices, be more conducive to the efficiency of the Church in the metropolis and its vicinity." After a discussion (in the course of which Lord Houghton suggested that these fine edifices, some of which were products of the genius of Sir Christopher Wren, instead of being pulled down and ruthlessly destroyed, might be used for other, and especially for educational purposes), the motion was withdrawn.

New Floating Small-pox Hospital.—The Admiralty Board have granted to the Metropolitan Asylums Board the use of H.M. steamship *Atlas*, 5,260 tons, which is now being rapidly altered and fitted up, off Greenhithe, for the reception of small-pox patients. Upon completion of the work the ship will be moved higher up the river, and moored off Deptford Creek. H.M. steam frigate *Endymion*, 3,197 tons, has also been granted for use as quarters for officers in attendance on the patients, and is being fitted with a steam laundry and the necessary cooking apparatus. The alterations and fitting up of the ships are being carried out under the direction and supervision of Messrs. A. & C. Harston, architects.

The late Lord Lawrence.—Mr. Woolner's bust of Lord Lawrence in Westminster Abbey was unveiled on Tuesday last. The bust stands on a pedestal representing the Indian lotus-leaf, against the north wall of the church on the west of the gate called the Canons' door, through which a glimpse of the green turf of the Paradise and of the cloisters round it is obtained, and nearly underneath the monument of Sir James Outram. It is of Carrara marble.

The New Bridge at Battersea.—The bridge, as now sanctioned by both Houses of Parliament, will be an iron structure, erected somewhat to the east of the present bridge, at an estimated cost of 231,000*l*. The width will be increased from 23 ft. to 40 ft., and the number of spans decreased from seventeen to five, the centre one of which will be 173 ft. wide. The new bridge will be 6 ft. higher than the present one, which will allow 15 ft. above Trinity high-water mark.

Builders' Benevolent Institution.—The annual general meeting of the subscribers and donors of this charity will be held at Willis's Rooms, King-street, St. James's, on Thursday, the 28th inst., at three o'clock p.m. Part of the business consists of a proposal to alter Rule II., by leaving out in lines 3 and 4 the words, "for each candidate to be elected."

A Brickmaker's Will.—The will (dated May 27th, 1876), with four codicils, of Mr. George Smeed, late of Sittingbourne, Kent, brickmaker and farmer, who died on May 2nd last, at Gore Court, Tunstall, Kent, was proved on May 31st last, by Richard Prall and William Trees Jackson, the acting executors, the personal estate being sworn under 160,000*l*.

Messrs. Clark, Bunnett, & Co., Limited, have fitted one of their patent invalid lifts on the hospital ship *Atlas*, and are now completing the food lifts on the administrative ship *Endymion*. The company are also, we are informed, carrying out the War Office instructions to fit their revolving shutters to the embrasures of the batteries at Gibraltar.

Middlesex Industrial School for Girls. This building at Bedfont, near Feltham, Middlesex, will be inspected upon its completion on Monday, the 18th of July.

New Royal Academician.—At a General Assembly held on Wednesday evening last at Burlington House, Mr. Edwin Long was elected a Royal Academician.

Cement from Canada.—The *Liverpool Journal of Commerce* says it is expected that a large quantity of Canadian cement will be shipped to Europe this fall.

TENDERS

For Falwood Workhouse extension, Preston Union. Mr. Joseph Harding, architect:—

All statements of facts, lists of tenders, &c. must be accompanied by the name and address of the sender, not necessarily for publication.

We are compelled to decline pointing out books and giving addresses.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

NOTICE TO SUBSCRIBERS.

THE INDEX and TITLE-PAGE for Volume XL. (January to June 1881), were given as a Supplement with our last Number.

A COLOURED TITLE-PAGE may be had, gratis, on personal application at the Office.

CLOTH CASES for Binding the Numbers are now ready, price 2s. 6d. each; also

READING CASES (Cloth), with Strings, to hold a Month's Numbers, price 2s. each.

THE FORTIETH VOLUME of "The Builder" (bound) is now ready, price Twelve Shillings and Sixpence.

SUBSCRIBERS' VOLUMES, on being sent to the Office, will be bound at a cost of 3s. 6d. each.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS TRADE, AND GENERAL ADVERTISEMENTS

Six lines (about fifty words) or under ..... 4s. 6d.
Each additional line (about ten words) ..... 0s. 6d.

Terms for series of Trade Advertisements, also for Special Advertisements on front page, Competitions, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.

SITUATIONS WANTED.

FOUR Lines (about THIRTY words) or under ..... 2s. 6d.
Each additional line (about ten words) ..... 0s. 6d.

REPLIES TO ADVERTISEMENTS,

Addressed Box ——, Office of "The Builder,"

Cannot be forwarded, but *must* in all cases be *called for*, and the Office Receipt produced.

THE CHARGE FOR A BOX IS AS UNDER:—

For "Situations Wanted" Advertisements ..... 3d. per Week.
For all other Advertisements ..... 6d. per Week.

PREPAYMENT is ABSOLUTELY NECESSARY.

"Stamps *must not* be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, King-street, Covent-garden, W.C. to

DOUGLAS FOURDRINIER, Publisher,
Addressed to No. 46, Catherine-street, W.C.

Advertisements for the current week's issue must reach the office before THREE o'clock p.m. on THURSDAY.

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. sent at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied *direct* from the Office to residents in any part of the United Kingdom at the rate of 18s. per annum, *prepaid*. Remittances payable to DOUGLAS FOURDRINIER, Publisher, 46, Catherine-street, W.C.

Best Bath Stone.
WESTWOOD GROUND,
Box Ground, Combe Down,
Corsham Down,
And Farleigh Down.
RANDELL, SAUNDERS, & CO., Limited,
Corsham, Wilts. [ADVT.

Box Ground Stone
Is the best for use in all exposed positions, being a well-known and tried weather stone.
50,000 feet cube in stock.
PICTOR & SONS,
Box, Wilts. [ADVT.

Doulting Freestone and Ham Hill Stone of best quality, in blocks, or prepared ready for fixing. An inspection of the Doulting Quarries is respectfully solicited; and Architects and others are CAUTIONED against inferior stone. Prices, delivered to any part of the United Kingdom, given on application to CHARLES TRASK, Norton-sub-Hamdon, Ilminster, Somerset.—Agent, Mr. E. WILLIAMS, 73, Charlotte-street, Portland-place, W. [ADVT.

Doulting Stone and Ham Hill Stone, of best quality. Prices and Estimates, including delivery to any Station, on application to
STAPLE & HANN, Quarrymen, Stoke-sub-Hamden, Ilminster. Agent, E. CRICKMAY, No. 4, Agar-street, London, W.C. [ADVT.

Asphalte.
Seyssel, Patent Metallic Lava, and White Asphaltes.
M. STODART & CO.
Office:
No. 90, Cannon-street, E.C. [ADVT.

Asphalte.—The Seyssel and Metallic Lava Asphalte Company (Mr. H. Glenn), Office, 38, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds and milk-rooms, granaries, tun-rooms, and terraces. [ADVT.

Immense quantities of
DRY WAINSCOT,
DRY MAHOGANY,
DRY WALNUT,
in all thicknesses.
B. J. HUDSON & SONS,
Whitfield-st., W., and Great Peter-st., S.W., London. [ADVT.

Accidents by Lightning would be unknown, if Gray's Patent System of Conductors were fitted to all buildings.—For particulars, see ADVT.

MICHELMORE & REAP,
Manufacturers of
CHARLES COLLINGE'S PATENT
COLLINGE'S PATENT HINGES, LEVER, SCREW, & BARREL BOLTS,
Self-Acting "FALL DOWN" GATE STOPS
and IMPROVED GATE FITTINGS of every Description.
36a, BOROUGH ROAD,
Discount to Builders. LONDON, S.E.
Illustrated List two stamps.

ZINC ROOFING
FIXED COMPLETE.
F. BRABY & CO.,
ESTABLISHED 1837,
THE MANUFACTURING AGENTS OF THE VIEILLE MONTAGNE CO.
PATENT SOLID UNSOLDERED RIDGE PLATES, FOR ITALIAN OR SQUARE ROLL CAP ZINC ROOFING.
By the adoption of this Method the use of Solder is Entirely Dispensed with, and consequently the Danger incurred by the use of Fire-pots is Avoided. The Cost is Lessened and the Durability Increased. Estimates for Zinc Dormers, Flats, &c.
FITZROY WORKS, 356 TO 360, EUSTON ROAD, LONDON.
ALSO AT DEPTFORD, LIVERPOOL, GLASGOW, and CYPRUS.
Architects, Engineers, and Contractors Supplied with Drawings and Estimates Free of Charge.

New York: A Great Growth.

IT is not merely the statement of the New Yorkers that New York has grown with a rapidity hitherto unknown in any of the great centres of population in the world. Actual and accurate statistics regarding America are more startling than even ordinary exaggeration, and we very much doubt whether a New Yorker who has been absent from his native city during the last thirty years,—could such be found,—would not find reason for more frequent surprises on his return than a Parisian on revisiting his beloved boulevards after a similar lapse of time. Now we learn by a recent telegram from New York, that the amount of building in New York is larger than at any time since the great fire of 1835. In the lower part of the city enormous ten and eleven-storied buildings for offices are being erected to meet the demands of business, and give capitalists the opportunity to invest money. In the upper part of the city the new dwellings are numbered by thousands. The effect on wages is 50 per cent. increase. Bricklayers get $4½ a day against $3 last year. Common labourers, like Italian immigrants, get $2½. There is a great demand for carpenters, stonemasons, bricklayers, and builders. They say it would be profitable to import German or English bricklayers and stonemasons, on two years' contracts for double the wages they are getting at home.*

Rapidly within the last generation the "Empire City" has been extending up the tongue of land which lies between the broad Hudson and the North River, and already from the Battery and Castle Gardens,—which speak, not alone by their names, but by their still uninjured old-world appearance, of the days when Manhattan was occupied by British red-coats, and took the name it now bears from its Royal governor,—up to Central Park, four miles and more up town, cross streets and long avenues are crowded and filled with houses, the greater part of which have sprung up within only a few years. The building activity of modern New York dates in a great measure from the fevered times which followed the War of Secession; till within some years since the activity continued unabated, to be arrested only a short time in the recent crisis through which America has now happily passed; and as we see by the news above quoted, prosperity again induces the builders to continue their work with a prospect of some years' steady employment before them. To those who know New York, it will be easy to picture the results that will follow on the revival of such an important branch of trade. There is no country where the interests of "real estate" are more closely studied, or where its value as a commercial factor is better understood. In this new impetus given to the building trade it is difficulty to calculate how many more streets up town, how many more "blocks," will be built to add on to the rapidly-extending city.

Thirty years ago, when the late Mr. Haight conceived the idea of building in,—or "on" as our cousins would say,—Fifth-avenue, a house that would eclipse any house which had yet been built in New York, he selected the corner of Fifteenth-street and Fifth-avenue for the spot, his wife, a famous New York beauty of that day, objecting to her husband building further up town, from the fear that they would be at too great a distance from the then fashionable quarter; and now fashionable New York resides in the vicinity of Fifty-eighth-street, in the neighbourhood of the Central Park, which, thirty years ago, was not even dreamed of. In this neighbourhood now magnificent houses abound, owned and occupied by people whose names are as familiar in London society as they are in New York or Paris, houses brilliant with the products of the ornamental centres of Europe. Notwithstanding the fastidious taste shown for many years past in the houses of some of the old English New York residents, we very much doubt whether the new generation, who are doing so much to make New York one of the finest cities in the world, will care to bestow credit or admit a very heavy debt of gratitude to the great social names that in New York, for the last hundred years, have been conspicuous above all others and all comers. From what we remember of the great treasures of art that New York undoubtedly possesses, and is rapidly acquiring, we fancy that the name of Astor, a new name comparatively, must already eclipse the more *dilettante* name of the old English resident and collector, Lenox, although, to draw any comparison between the Lenox library and the collection of pictures, and the more popular and noble foundation of the Astor Library, would partake of the invidiousness that is proverbially odious.

The new move up-town which the revival of the building trade will inevitably cause will probably before receiving another check envelop the Central Park; four years since, when last we saw New York, the few houses that had been built beyond the point at which the park commences, were mostly unoccupied; and the neighbourhood of the American Natural History Museum,—opened at about that time,—will be doubtless rapidly filled up. As an architectural feature the American Natural History Museum probably only merits that praise which is very correctly due to the perfect fitness of the design to the purpose intended, and in this respect certainly the completeness of the arrangement within, and the thorough manner in which the most minute object is displayed in a full light, produce on the mind of the visitor a feeling of admiration that entirely overcomes any disposition to criticise the exterior, although perhaps the most profound expert would find it difficult to quarrel with the manner or the perfection of the workmanship of the whole building.

The neighbourhood surrounding this magnificent institution surpasses all idea that we people at a distance can have in connexion with New York. Before the Museum stretches a park of exquisite beauty,—the Central Park,—nature having been aided by accomplished scientific and artistic gardeners who have studied in the forests and old-fashioned gardens of old England, in the prim and conventional gardens of France and Germany, and in the ideal and poetic villas of Italy and the East, and all this within a few hundred yards of the noble Hudson river, backed by the "Palisades," with their extraordinary geological structure. Here round this Central Park, the name of which indicates its being the proposed centre of New York, houses are springing up in rapid succession, all of which are now almost in immediate communication with Wall-street, at a distance of four or five miles, by means of the elevated railway, and well-made, if as yet scarcely well-kept, roads.

All this is certainly very different from what those who used to know New York can remember. Thirty years ago, when first we saw New York, Fourteenth-street was a quiet substantial street, occupied by a few of the oldest and wealthiest inhabitants, a considerable portion of the land being then occupied by lovely nursery gardens, owned by old Dutch proprietors, who had carried the cultivation of choice flowers to very great perfection, a delightful branch of commerce in which the New Yorkers to this day have retained their reputation. On those old gardens since then have sprung up a class of houses, the rents of which have enriched considerably the descendants of the wise old knickerbockers, many of whom still hold on in the belief that some day the enormous increase of the value within the last few years will augment still more; fortunately for these gentlemen their acquired wealth enables them to pay year by year the extraordinary heavy tax on the estimated value of their at present unrealised property.

Four years ago the building trade of New York was in anything but a prosperous condition. We were in New York at the darkest moment of its financial history; since then, we all know what difficulties the Americans have successfully fought and overcome, and not a week now passes, scarcely a day, that we in England, and that the whole of Europe, are not called

* New York telegram to *Daily News*, July 11, 1881.

upon to express our astonishment, and very often our admiration, for a condition of prosperity that no one doubts must affect greatly in one way or another, and most certainly for good, the whole of the world.

It is not only in New York that the success of America has given a great impetus to the building trade; we are constantly hearing from other great American cities of their rapid increase. With the wildest stories of the marvellous growth of Chicago we have long since become familiar, and Chicago is but one of the many other cities "out West" that, within considerably less than a generation, have been, so to speak, called into existence. In the older States the same changes have been effected. Boston is no longer the Boston of thirty years ago, when first we saw it, not much unlike the old town of ante-independence days, which Fenimore Cooper has so well described. Providence, Rhode Island, was a village then, and now possesses one of the largest hotels in America; and many another quiet old half-English town that smacked strongly of the days of British rule, and even of those when the "bulbous-bottomed burghers" of Washington Irving's ever-genial and amusing history, smoked their long pipes under the shadow of old trees, or of their own scarcely less umbrageous broad-brimmed hats, outside their old red-brick, crow-stepped gabled Dutch farm-houses, the last of which, by the way, disappeared from New York not so very long since.

Thirty years ago Washington presented all the appearance of a charming old colonial village, the chief houses of the officials, the old residents, and the best hotels being low houses, many of them built, like the Anglo-American houses of that time, of wood, comfortably surrounded by their verandahs, and in most cases embowered in shady trees, like the famous house of the Spanish ambassador, Calderon de la Barca, the husband of the still more interesting Madame de la Barca,—a Scotchwoman and the authoress of a work on Spain that, by this time, must, from circumstances known doubtless to many collectors, be one of the very rare books for which America and Americans are now giving such enormous prices. Our own ambassador at the same time, Sir Philip Crampton,—one of whose unpaid *attachés* was then the present Earl of Lytton, since Governor-General of India,—lived also in a delightfully shady house over-looking the Potomac. Those were days when a few minutes' walk or drive brought one into what appeared to be the remote recesses of a primæval forest.

Since then, and of course since the War of Secession, building interests in Washington have been somewhat active. Young men who have grown up in Washington within the last thirty years regard it, even after visiting the Continent, as a second Paris. As it was when we first saw it, its appearance was almost, with the exception of the Capitol,—then not a fourth of its present size,—and one or two other public buildings, the Smithsonian Institute among the number, like Tunbridge Wells, or some such other cool retreat. What the "White House" was then, it still is, though what the "White House" of the future is likely to be, Americans alone, with the assistance of the architectural learning of Europe, can determine.

As a natural consequence, the enormous increase in the number of residences that are being built in Washington, New York, and elsewhere, will have the immediate effect of enlarging all the Northern summer resorts. Washington, particularly, being blessed, or cursed rather, by a climate that makes it like many other American cities, an unendurable summer residence for all but the now happy negro population, and those unhappy Government officials, whose felicity alone consists in the obscurity of their positions allowing them at least the indulgence of the pleasure that comes with the security of permanent appointments; but even the Government clerks, those who do not go out at the end of every four years, are obliged to get away during a month or two of the hot season, and away they rush to those delightful resorts, if not to the North and the sea-side, to the White Sulphur Springs and the Sweet Sulphur Springs in the mountain ranges of Virginia, where, thirty years or so since, there existed a society from the South, that would have been a sufficient attraction without the natural advantages afforded by the delightful springs themselves and the cool shade of the surrounding woods.

A LITTLE MORE ABOUT DRAGONS AND ANGELS IN ART.

ALTHOUGH the name "dragon" is sometimes applied to any gigantic and formidable reptile, there can be little doubt that the normal type of the Mediæval dragon was a winged monster. We may cite the authority of Linnæus, in the name he gave to a lizard, which, though not furnished with true wings, has a pair of membranous expansions on its sides, which sustain the creature in a leap through the air, the *Draco volans*. Before the time of Cuvier, the specific name given to this small lizard may be said to have represented the only link that existed between the science of the naturalist and the dragons of mythology. But palæontology had not advanced very far before it taught us that a winged reptile was not an imaginary creature, but one that ranked among the extinct forms of life that once inhabited our planet. The pterodactyl, or wing-finger, was a true flying reptile, of fiercely predacious and carnivorous habit,—as formidable an assailant in the air as the crocodile, a survival of the numerous water dragons of the herpetiferous strata, is in the water. The discovery, so late in the course of time, of the fact that the winged dragon has been an undoubted denizen of our planet, leads to the question whether any form of pterodactyl, or of other winged reptile, lingered until historic, or at least until human times. Invention is rarely original; and for a truly original invention to turn out to be a true description of something wholly unknown to the inventor, is a phenomenon as yet unknown. It may be said that the winged dragon of mythology is not identical in the arrangement of its wings with the pterodactyl. Were we to see that creature in life, however, it is hardly probable that our attention would be riveted on the articulation of its wing-bones. Still less is this likely to have been the case in those earlier times when all that was known of anatomy was derived from observation of wounds in battle. Of course, no one is in a position to assert dogmatically that the mythical dragon is really a tradition, not an imagination; but the subject is not unworthy of consideration. The accounts, some of which are indisputable, of the sea-serpent, have been thought by some naturalists to denote the survival of some rare specimens of the plesiosaurus, a contemporary of the pterodactyl. Unless the creature be an enormous conger,—of the limit of age and size of which creature we have no positive knowledge,—we seem to have little choice but to regard it as some rare and all-but extinct saurian. Such might have been the sea-dragon from which Andromeda was rescued by Perseus. The dragon depicted by Moritz Retz as devastating Rhodes comes within historic times; for Diendonné de Gozon, the young knight who slew the monster, according to the legend, is known to have been a Grand Master of the Order of St. John of Jerusalem. Hence there seems to be a nucleus of truth in the legend, though it is possible that the dragon in question was an enormous snake.

The power of transformation, or the phenomenon of attaining, at a certain age, a form unlike that worn at birth, which is characteristic of the class *Insecta*, is found among one great group of reptiles; although that is a group widely differing from the Saurians, or dragons. It is that of the Batrachia, or frogs. In the spring of 1880 we witnessed a spectacle that was perfectly new to us,—that of a number of little frogs, in a garden pond, hopping merrily before they had lost their tails. They were like little efts,—or rather like little crocodiles, with four well-formed legs and long tails, but had exchanged the movement of the tadpole for that of the frog. Generally, we think, the tail becomes absorbed before the creature leaves the water. The cuirassed pirates of the ancient oceans are represented, to a certain extent, by another reptile family, the Chelonia, among which one, called the snapping turtle, which is something like a snake furnished with a carapace or shell, into which to retreat, is a very formidable carnivore. The magical power of transformation possessed by one reptile group may in old times have added to the uncanniness of reptiles as a class. Poetry and art have been in accord in giving reptile characteristics to the personification of the Power of Evil. It is possible that the terror caused by the subtle movement, enormous strength, and (occasionally) fatal venom of some of the great ophidia, or snakes, may have led to that association. Yet if there be any form which is more unlikely to be provided with wings than another, it is that of the serpent. We cannot pretend to assert that the wings of the Mediæval dragons have any other origin than the imagination. But it must be confessed that the discovery, so long after the form of the winged dragon had become conventionalised in art, of the remains of actually winged dragons, forms a subject worthy of further consideration.

As to angels, it may be added to what has been already said in these columns, that it is remarkable that no word corresponding to our ordinary idea of an angel exists in ancient Semitic literature, although there are twelve words that are occasionally used, as now understood, to denote celestial messengers or intelligences. So fully, however, is our first remark justified, that we find the rabbinical writers positively transliterating the Greek or Latin *angelus* or messenger into the barbarous form *angla*. Among the words of ordinary meaning, applied in a special sense to designate supernatural beings, are not only the well-known Cherubin and Seraphin, Thrones, and Powers, but the words men, gods, sons of god, sparklers, watchers, wheels, and beasts, or living creatures. We spare our readers the cumbrous Aramaic forms. A considerable amount of angelology had been compiled before the date of the close of the Gemara, about 500 A.U. Thus we hear of Duma, the angel of silence; Yurek, the prefect of hail; Yohach, the angel of travel; Lajelah, the angel of child-birth; Asariel, the prefect of the waters; Suriel, the prince of the Divine Presence; Gabriel, Uriel, Raphael, Michael, Zadkiel, Hanael, and Cassel, the angels of the Seven Planets. The most terrible name in the shadowy host is that of Samael, the prince of the air, a malignant angel, who is sometimes identified with the planet Mars. Asmodai is another evil name, whether applied to the same impersonation or not is questionable. Argentin, the prefect of baths, seems to denote by the name a Latin origin, though the word is found in Aramaic.

It is tolerably clear from this brief abstract of a somewhat extended study of the subject, that the Semitic imagination, however much indebted to Persian or Assyrian influence, ran riot in the regions of the invisible quite as much as did the Latin fancy. The prohibition to represent animal forms, however, has had the result of confining the knowledge of the Semitic angels to the few students of this literature. Among the Latins, on the contrary, the few types that have been embodied in stone, or depicted on canvas or on glass, have survived the literature which gave them birth, and still tell, in many a shadowy nook of ancient church or cathedral, of the visions of horror or of beauty in which the imaginations of our ancestors were wont to indulge.

THAMES BRIDGES.

THE course of a few years will make an immense difference in the aspect of many of the bridges over the Thames. At Putney the right line of the road will be restored; the hideous aqueduct that now crosses the river (in that line) will be removed, as well as the tottering and decaying pile of the old wooden bridge, and a stately granite structure, built at a large cost, will provide for both road traffic and water conduit.

At Battersea, we now learn that an iron bridge of five spans is to replace the seventeen apertures of the old wooden structure. The centre span will be 173 ft. wide, with a height in the centre of 15 ft. above Trinity high-water mark, which is 6 ft. more than the present clearance. The width of the roadway will be 40 ft., instead of the present 23 ft. The estimate of 231,000*l.*, if verified by the construction, does not appear an out-of-the-way one for this great architectural improvement as one mode of crossing the Thames at Battersea. We may add that it is to be hoped that the new line for which the London and South-Western Railway have obtained a Bill, will enable the traveller to get from Guildford to Chiswick in less than two hours and a half.

Highbury Institute of Art, Science, and Literature.—The committee has succeeded in passing the candidate for Advanced Building Construction at the South Kensington Examination. The winner of the certificate is Francis J. Bancroft, a junior in the Highways Department of Islington Vestry. This speaks well for the instruction given by the drawing-master, as the questions are difficult ones to answer by a student of seventeen.

INTERNATIONAL MEDICAL AND SANITARY EXHIBITION.

THE OPENING CEREMONY.

THE proceedings in connexion with the opening of this Exhibition took place in the Royal Albert Hall on Saturday afternoon last, the President, the Right Hon. Earl Spencer, K.G., Lord-President of the Council, in the chair. There was a large attendance of ladies and gentlemen.

Earl Spencer said he owed the honour which he had of presiding over that meeting, firstly, to the fact that the illustrious patron of the Exhibition, H.R.H. the Duke of Edinburgh, was away with one of Her Majesty's fleets in the Baltic; and, secondly, in all probability, to the fact that he was now at the head of a department of the Government from whom some of the galleries in which the Exhibition was arranged, were held. He belonged to that department of Her Majesty's Government to whom were referred any large questions touching medical education in this country, and he had lately felt the great responsibility of his position, by having assigned to him the difficult task of appointing a commission to consider a subject of great medical importance to this country,—a commission which he hoped would lead to changes in the law with regard to medical education which would be greatly conducive to the welfare of the community. He should not detain the meeting very long by the few remarks which he thought it to be his duty to offer on that occasion. He could not help referring to the great improvements which had been made during the last fifty years in sanitary matters,—improvements which had tended so greatly to improve the health of the community. Such improvements had been a necessary condition of the development of the resources and wealth of the country. The health of vast masses of the population had been beneficially affected by public works of reclamation which were now to be seen in all parts of the world. Marshes from which used to spring fatal agues and malaria were now to be seen converted into fruitful and wholesome fields and farms. Such improvements as those to which he was referring had removed one of the great impediments in the way of the health, and therefore of the wealth, of the community. Other public works that had been carried out, such as the drainage, lighting, and water-supply of our towns and villages all over the kingdom, and, last though not least, the improvement of the dwelling-places of the people, had been no less beneficial in their results. All the improvements he had mentioned had, he ventured to think, exercised a vast influence on the health of the community, and those who were engaged in the Legislature of the country were from time to time brought into contact with facts which showed that to be the case. Again, very many of those who were connected with the work of local government, or with the management of private property, had largely given attention to the work of sanitary improvement in the directions he had indicated. But, while referring to what public men, people connected with local government, and managers of private property, had done and might do for the good of the health of the community, he must not forget to make special allusion to the energy, ability, and activity of the members of the great medical and surgical profession. He ventured to think that, during the last fifty years, the greatest possible improvements had been made in the way in which the members of that distinguished profession had carried out their work. They had availed themselves of the appliances of modern science, which they used for the alleviation of pain and for the promotion of the health of the community. He was glad to be able to refer to one proof that such efforts had not been wanting in success in achieving the desired end, at any rate in this country. It was only the other day that a colleague of his, in presenting to Parliament the preliminary abstract of the Census just taken of the population of the United Kingdom, referred to a fact upon which he thought they might all congratulate themselves very much. He referred to the fact that the death-rate of the kingdom during the last ten years had most notably decreased,—to such an extent, indeed, that during the last ten years 300,000 lives had been saved, which would have been lost had the death-rate of the preceding decade continued. Without doubt, that diminution in the death-rate was largely due to improved sanitary conditions. He believed that the Exhibition which the meeting was met to open would be of great value by bringing together the experience of the medical men, architects, and sanitary engineers not only of this country, but of every part of the world. That, he thought, would be a great advantage to all those who had the health and prosperity of the people at heart. He believed also that the value of the Exhibition would be greatly enhanced by the international congress of medical men, which was shortly to be opened. That congress would no doubt also have an important bearing on the Exhibition. The Exhibition, he might add, was divided into two classes or departments, the Medical and the Sanitary. Those who were specially interested in or identified with the medical profession would find in the Medical Department all the newest surgical inventions and appliances, and all other matters which would conduce to the well-being of those who had to undergo painful operations, or who had to endure sickness of any kind. There was also exhibited almost every drink recommended by the faculty, from Apollinaris water to decoctions of the bitterest drugs known in medicine. The visitor to the Sanitary Department of the Exhibition would, he was sure, be struck by the infinite scope and breadth of that part of the display. There would be found there not only all the best models of house drainage, both internal and external, but illustrations of all the best systems and appliances which had been devised for the drainage of towns and villages. There would also be seen almost every conceivable appliance, from the best means of warming and ventilating a house to the best kitchen stoves and utensils. There were also to be seen the best and most wholesome means of house decoration in lieu of poisonous wall-papers. In short, every conceivable sanitary material and appliance was to be found in the Exhibition, and everybody who was building or furnishing a house, whether a mansion or a cottage, would be able to see how very much the appliances and fittings of a house contributed to the health or illness of its occupants. To neglect the teachings of sanitary science was to encourage sickness and ill-health On the other hand, adherence to the soundest and wisest principles of sanitation in the fittings and arrangement of a house could not but conduce to the health of those who lived there. He most heartily wished the Exhibition every possible success. He wished it success not only at the present time, and during the time it continued open, but a more permanent success, and he sincerely trusted that it would enable those who had the management of that admirable institution, the Parkes Museum of Hygiene, to put that museum on a permanent basis. The Museum bore the name of a distinguished man, a leader in the work of hygienic reform, and he trusted that the efforts which were being made to give it a permanent home worthy of it would be crowned with success. Without saying anything further at that moment, he would call upon Dr. Poore, the hon. sec. of the Parkes Museum, to read a statement explanatory of the origin of the Exhibition.

Dr. G. V. Poore then read the following statement:—

"MY LORD,—As the honorary secretary of the Parkes Museum of Hygiene, the duty devolves upon me of stating briefly the origin of the International Medical and Sanitary Exhibition, which is inaugurated to-day.

The Parkes Museum, which was formally opened on June 28th, 1879, by Sir R. A. Cross, G.C.B., has clearly met a great public want. It has been opened gratuitously to the public on three days in each week, and the number of visitors, which amounted to 2,166 in the first year of its existence, increased to 2,540 in the year which has just closed.

The practical lectures which have been delivered to artisans, workmen, and others, have been attended by numbers which have steadily and progressively increased, so that latterly they have been in excess of the accommodation which the museum in its present situation is capable of affording.

Thus encouraged, the Executive Committee thought that a successful attempt might be made to organise an exhibition of sanitary appliances on the occasion of the assembling in London of the International Medical Congress. This idea was received with approval on the part of the officers of the Congress, and in order that the exhibition might have an additional interest for our medical guests, it was resolved to make it representative of Medicine as well as of Hygiene, and it was finally decided to include in it anything which might reasonably be considered of use in the prevention, detection, cure, or alleviation of disease.

A sub-committee of the Executive Committee of the Parkes Museum was appointed, with power to add to its number any persons likely to forward the interests of the exhibition, and the Exhibition Committee, as finally constituted, consisted of Mr. Erichsen (the late president of the College of Surgeons) as Chairman, the president of the Pharmaceutical Society, a professor of hygiene, two physicians, three surgeons, three architects, and two engineers, with a surveyor, Mr. Judge, as secretary.

The labours of this Committee have been considerable, but they have been much lightened by the sympathetic co-operation met with on all sides.

To the Royal Commissioners for the Exhibition of 1851, to the Council of the Royal Horticultural Society, to the Science and Art Department, to the Director of the South Kensington Museum, and to the President and Officers of the International Congress, their thanks are especially due.

The Exhibition Committee are proud to be able to state that His Royal Highness the Duke of Edinburgh has graciously consented to become the Patron, and that the Lord-President of the Council has courteously accepted the office of President of the Exhibition.

The Executive Committee of the Parkes Museum, while they have every reason to feel satisfied with the work which they have accomplished, are not without anxieties for the future. The present home of the Museum is daily becoming more inadequate, and the funds at their disposal are barely sufficient to pay the very small current expenses. Their ambition is to permanently establish the Parkes Museum in a building of its own, and they are not without hope that the International Medical and Sanitary Exhibition may be the means of directing public attention to the needs of the parent institution. Should this Exhibition prove financially successful, the profits will be handed to the treasurer of the Parkes Museum, and it is hoped that the knowledge that one of the ultimate aims of the Exhibition is to assist in the permanent establishment of the Parkes Museum, will prove an additional incentive to the public to visit the International Medical and Sanitary Exhibition."

Mr. Mark H. Judge, secretary of the Exhibition Committee, read the following report:—

"My Lord President, my Lords, Ladies, and Gentlemen,—The brief statement I have the honour to make to you on behalf of the Exhibition Committee must, I think, gratify both the exhibitors and the public generally, since it clearly shows that the interest taken in this, the first International Exhibition of its kind, has been of an eminently practical character.

It was natural that the committee should count upon receiving the co-operation of their own countrymen in an undertaking which could not fail to benefit this country, but they could hardly have expected the large amount of support that has come from the people of other countries.

The exhibits are divided into seventeen sections, and they represent almost every industry connected with Medicine, Architecture, and Sanitary Engineering. One feature specially worthy of mention is that the work of artisans is exhibited by themselves.

Besides the exhibits which have been contributed by London, Dublin, Edinburgh, Glasgow, Liverpool, Manchester, Birmingham, and other large towns in the United Kingdom, the following countries have sent contributions, viz.:—France, Germany, Austria and Hungary, Italy, Switzerland, Turkey, Holland, Belgium, Norway and Sweden, Bohemia, Bavaria, India, and America.

Thanks to the heartiness with which the exhibitors have fallen in with the arrangements made by the committee, the exhibition that you have been invited to inspect to-day is not in an unfinished condition, but is full and complete.

It was at first intended that the judges of the different sections should make their awards to the exhibitors on the opening day, but the extent of the exhibition has made it necessary for them to prolong the time for their examinations, and therefore the awards will not be made until next week.

The public spirit shown by the subscribers to the Guarantee Fund should not be overlooked, as without this the committee could not have ventured on an undertaking of such magnitude.

With such an inaugural meeting as the present, there can be little doubt that this exhibition will be the means of providing a considerable sum for the Parkes Museum, and at any rate it is sure to stimulate invention and improvement in all that relates to health."

The Right Hon. Earl Granville, K.G., said that at a time such as that, when London was so full of business and of pleasure, the presence of so many ladies and gentlemen as he saw before him was a very clear indication of the interest which was excited by the objects of the Exhibition,—objects so very wide that, as Lord Spencer had described them, they included house drainage, architecture, engineering, furniture, food, clothing, and the prevention of disease. He must admit that when he received his card of invitation to attend the meeting, and found insidiously inserted on the back of it that he was expected to deliver an address, and that he was to be followed by Sir James Paget, his heart sank within him; but he had been somewhat relieved by the fact that the two excellent reports which had been read, and the singularly clear and lucid statement of Lord Spencer, left him very little to say. Perhaps the committee, in inviting him, were desirous of imitating the practice that now obtained in some of our theatres. The managers of those establishments, desirous of meeting the requirements of those who came early and liked a quantity for their money, and of those, on the other hand,

who liked to dine comfortably before the evening's amusement, advertised the great piece of the evening to begin at eight o'clock, and in smaller letters on the bills they announced that some trifling play would be enacted before it, so as to amuse the early-comers, and to whet their appetite for the chief performance of the evening. In the same way, he supposed he had been invited to speak in order to whet the appetite of the audience for the address of Sir James Paget He thought it was Dr. Parkes himself who defined hygiene as the art of preserving health,—in other words, the art of giving the most complete action to the mind and body for as long a period as was consistent with the laws of life. All people, sometimes voluntarily, sometimes involuntarily, thought and talked of health; and he ventured to say that if anybody were rash enough to admit in company that he had some indisposition, he would find the majority of those present eager to prescribe for his diet and his regimen, everybody having some favourite pills to recommend. He remembered some years ago having a severe attack of gout while in Rome. As soon as the news spread he was immediately inundated with prescriptions, not only in English, but in Italian, French, German, and even Russian. The Cardinal-Secretary of State was good enough to tender him some advice based on his own personal experience; another foreign minister gave him exactly contrary advice; and such was the happy result of that combination of prescriptions that he did not get well until he had left the grand old city behind him. In Easter of the present year,—it being a dull season with the newspapers,—a report was published that he had a serious attack of gout. It was a subject very unworthy of attention, and, luckily for him, the report was entirely without foundation, but nevertheless, he had been most deeply touched since that announcement by the receipt, daily and even hourly, of letters of advice upon that, to him, interesting topic. He had been advised to drink whisky, he had been advised to drink claret, he had been advised to adhere to the most rigid teetotalism, he had been advised to live generously, and he had been advised almost to starve himself; while one gentleman, whom he had no reason to suspect of being a dentist, advised him to provide himself with a complete apparatus of artificial back-teeth. The moral he gathered from all that, was that even for maintaining the health of a single individual, study alone, or experience alone, was not sufficient. He believed that they required science, art, and experience combined to be of use in such matters. Now, if that was the case with regard to the health of an individual, how much more was it so with regard to the health of large communities! Lord Spencer had referred to some very satisfactory statistics gleaned from the recent census. That census showed how the population of this country was increasing. With regard to the metropolis alone, the numbers very nearly approached the enormous total of four millions! Many of those present would remember the observations of Archbishop Whately with regard to the great problem of affording food to such agglomerations of human beings occupying a comparatively small area. How easily the work of providing such vast masses of men, women, and children had been done by their fellow-beings, prompted by self-interest, and how impossible would it be for the Government to do such work efficiently and without enormous waste! But, besides air and food, there was water,—which was a prime necessary of life, whether for drink, for purposes of cleanliness, or for its use in antagonism to fire. That was a thing which could not be in all cases effectively provided by private enterprise. If it were to be provided either by the Imperial Government or by local authorities, it ought to be on the best possible principles both as to quality and as to the quantity of the supply. He considered that in this great city of London we were most imperfectly provided with water. The question was one beset by difficulties, and was one among others in which specialists could do much, by the dissemination of sound principles, to develop a healthy public opinion. He believed that exactly the kind of sanitary information which was desired would be furnished by the Exhibition about to be opened,—an exhibition which was the outcome of the Parkes Museum of Hygiene. Her Majesty's Government were perfectly alive to the importance of sanitary questions. The meeting would be aware of the causes which had made the present session so barren of legislation on questions of that kind. He was happy to say, however, that there was one measure with regard to the flooding of rivers,—a matter which bore most essentially upon the health of many towns and villages,—which had been got to such a stage that the Government had a very strong hope of being able to pass it into law this session. He knew that the path of the sanitary reformer was not always a smooth one. The subject itself in some of its details was of a disagreeable character. There were many obstacles to the progress of sanitation, as such veteran reformers as Mr. Chadwick could testify, including vested interests,—or fancied interests,—in many forms. Of one thing he was quite sure, namely, that the friends and fellow-labourers of the late Dr. Parkes would feel that their reward would be ample if, through creating the Parkes Museum as a memorial of his connexion with University College, and in commemoration and perpetuation of his untiring devotion and great services as a sanitary reformer since the time of the Crimean war, the Exhibition which was the outcome of that Museum should be the means (as it was likely to be) of greatly increasing the interest of the public in sanitary matters. It was a happy idea to have held the Exhibition during the visit of about 600 medical men from all parts of the world. The International Medical Congress would be attended by some of the most eminent medical men in the world, and he had not the least doubt that the result of their deliberations and of the teachings of the exhibition would be the dissemination of much useful information as to the laws of health, and that such information would be immensely conducive to the well-being, not only of the bodies, but of the minds and characters, of their fellow-creatures all over the world.

Lord Spencer explained that the Right Hon. J. G. Dodson, M.P., who had promised to be present if possible, had been prevented from attending owing to the pressure of important official duties.

Sir James Paget said he should not have ventured to address the meeting,—which was essentially a meeting for the opening of the Exhibition,—but for the relation which had been mentioned as subsisting between the Exhibition and the International Medical Congress. It was in the first instance suggested that the organisation of such an Exhibition would be a proper part of the duties of the executive committee of the International Medical Congress, but for various reasons it was decided that the work of organising the exhibition should not form part of the duties of the Congress Committee, who felt that they would have enough to do without undertaking the great amount of labour that the organisation of such an exhibition involved. What had been achieved by the Exhibition Committee was enough to prove that the Congress Committee were right in leaving the Exhibition in the hands of a separate committee, who had devoted an amount of energy to the work which would have been quite beyond the power of the Congress Committee, although the latter were served by that most admirable of general secretaries, Dr. MacCormack, to whom, if the Congress was successful, as it could hardly fail to be, more than nine-tenths of the credit of such success would be due. The results shown by the Exhibition Committee, in the number and variety of the appliances and materials exhibited, were beyond what the most sanguine promoters of the Congress could have dreamt of. It was an Exhibition of which he believed the country might well be proud and one which would be fraught with instruction and pleasure to the distinguished foreigners who would visit it in connexion with the Congress, and who would find much in it not only to criticise and to advise upon, but to admire and learn from. Although we in this country might justly be dissatisfied with the present hygienic state of England,—and, he might add, they were proud of their dissatisfaction, for there was no ignorance so dangerous as that which was supported and perpetuated by self-satisfaction,—yet we had very much to show for the results of the teaching of sanitary science in the country during the last few years, thanks to the intelligence and industry of a comparatively small band of sanitary reformers. Lord Granville had mentioned with commendation the name of Mr. Edwin Chadwick, but he might add to that a long list of names, beginning with that of Mr. Simon. He might also refer to the great mass of knowledge on sanitary matters now in possession of the Local Government Board,—knowledge collected by its army of medical and engineering inspectors, and not to be surpassed in extent or value by that gained in any country in Europe. The difficulty was in applying all that knowledge,—in always doing exactly the right thing under ever-varying circumstances. He thought it was a good omen for the success of the Exhibition and Congress that the Lord-President of the Council was in the chair on that occasion, because he represented that which he believed would be the best work that the Exhibition could do, viz., the work of educating the public in sanitary matters. Presiding, as his lordship did, not only over medical education, but over every branch of education in the kingdom, he did well to recognise that one of the prime objects of the Exhibition and of the Parkes Museum of Hygiene was the education of the public in sanitary matters. He (the speaker) could himself be no efficient judge of the comparative merits of the different preventive appliances that were exhibited, because his life had been spent in trying to mitigate the miseries that resulted from the want of the prevention of disease. No doubt the work of preventing disease was a much happier task than that of trying to cure it. The medical man had very much to be thankful for in the advance of sanitary science. It was a great assistance to him to know that, owing to advances in sanitation, he need not, under proper precautions, fear the spread of infection from one patient to another, and that he need not fear that his skill would be thrown away owing to the foulness of a hospital drain; but that, aided by the art and science of nursing, and the recognition of sanitary laws, his patients now had everything in their favour, and that the curative means he employed would have fair play. Such exhibitions as the one which they were assembled to open must do much to promote a knowledge of sanitation. Amongst the exhibitors themselves, a wholesome rivalry in the attainment of what was as near perfection as possible was set up. Mutual criticism of each other's appliances was likely to bring out the weak and the strong points in such things, — and perhaps the exhibitors looked at each other's goods with keener eyes for defects or improvements than were possessed by the judges of the awards. A spirit of emulation was set up, and the public, in the long run, were the gainers. Another important feature of such exhibitions was their educational effect on the masses of the people. People who visited the Exhibition would learn something about the principles of sanitation, and could exert an influence in favour of sanitation amongst their friends and neighbours, but more especially amongst the poorer classes. He wished it could but be once strongly impressed upon the people, by some strong and lucid speaker, how very completely the wealth of the country was dependent upon the health of the population. The wealth of a country such as England depended in only a very secondary degree upon its climate and its soil, its mines and its industries. Its agriculture and its industries depended far more upon the will and power of its people to work, and such power depended upon strong minds and strong limbs, and these, in their turn, were dependent upon and could not exist without health. In this country, therefore, health was pre-eminently wealth, and he who did not do all he could to promote his own health forfeited his right to wealth, and was guilty of the basest want of patriotism. There was one thing quite certain and fully recognised in Medicine, viz., the relation between constitutional and local disease. Nothing was more clear than that local diseases sooner or later affected the whole body. In the same way, one unhealthy neighbourhood, one plague-spot, often infected a whole district, and one district infected another, until the whole tone of life all over the country was sensibly lowered. Knowing this, then, he wished most cordially success to the Exhibition. If he had one other reason why he wished it success, it was that he reverenced the memory of Parkes, and he therefore hoped that the success of the Exhibition would be such as to help in placing the Parkes Museum of Hygiene on a more permanent footing, seeing that that institution sought to perpetuate the work to which Parkes devoted the best years of his life.

The Chairman.—It is now my pleasing duty to declare the International Medical and Sanitary Exhibition open.

Mr. George Godwin, in moving a vote of thanks to the Right Hon. Earl Spencer for presiding, said the resolution which had been

put into his hands was one which needed no commendation or argument on his part. He had proposed to himself to make a few observations on the general subject before speaking to the resolution itself, but he was now afraid to do so lest he should weaken the effect of the very eloquent and admirable address which they had just heard from Sir James Paget. Nevertheless, as representing the Executive Committee of the Parkes Museum of Hygiene and the Executive Committee of the Exhibition, he would venture to add a few more words, as earnest as he could command, to introduce to the attention of the meeting, and to urge the claims, — he had almost said the paramount claims,—of the Exhibition upon the attention of the public and the Press. A very considerable advance had taken place in public opinion on the subject of sanitation since, many years ago, a few earnest men began the work of sanitary reform; but he was afraid, that even at the present time there existed scarcely so agreeable a state of things as might be supposed from the tone of the speeches which had been delivered. Sanitary reform was a matter which still failed to excite a due amount of interest,—one which was still too much neglected. It should be remembered by all that it was not a question of rose-water, or of strains from Hungarian bands, pleasant as such things might be. It was a question of health and happiness,—a question of life and death, and a question on which every man,—aye, and every woman too,—had it in his or her own hands to exercise an influence for good or evil. The object of the Parkes Museum had been, and continued to be, to disseminate generally the truths of sanitary science, and also to show,—what the Exhibition just declared open showed on a larger scale,—the best appliances that could be had for practically applying those truths or principles. It would have given him very great pleasure to have commented upon some of the points suggested by the Exhition, but opportunity did not permit, though there was one matter to which he would direct attention as illustrating its value in relation to some statistics which had recently reached him. The statistics to which he referred were of especial value in connexion with the plans which were exhibited for the arrangement of hospitals and other institutions of the kind. It appeared to be a well-ascertained fact that the French soldiers who were wounded in the Crimean War, and who were subjected to surgical treatment, died at the rate of 75 per cent. In the American Civil War, on the other hand, the soldiers, who sustained quite as severe and as dangerous wounds as those sustained by the French soldiers, and who were treated with certainly not greater surgical skill than the latter, only died at the rate of 34 per cent. What was the reason of the mortality amongst the American soldiers being less than half that amongst the French soldiers? Simply because the French soldiers under surgical treatment were placed in old-fashioned and badly-contrived hospitals, without any proper arrangements for ventilation and drainage, whereas the American soldiers were placed in single, detached, and even rudely-constructed separate buildings, in which air had free circulation, and good drainage was practicable. In some of our own hospitals there were surgical wards, which were simply places for dying in, and the surgeons knew it, and were helpless. The state of things existing in the houses of the very poor in London and other large towns of the kingdom was still deplorable. It was true that many great improvements, materially lessening the death-rate, had been effected, but still the story of sanitary neglect in the present day was appalling, and called for the paramount attention of every man deeming himself a statesman. He did most sincerely hope that when present difficulties were overcome, her Majesty's Government would evince a great and proper interest in the vital subject of sanitary reform, and that they would press forward necessary legislation on the subject. If the people of this country, especially women, would only make themselves acquainted with the good that flowed from the observance of sanitary laws, and would insist upon their observance, the amount of benefit that would be effected would be greater than could be imagined. He was sure that the meeting was very much pleased with having had Lord Granville and Lord Spencer with them on that occasion, and it was his most pleasing duty to propose that the best thanks of the meeting be given to the Right Hon. Earl Spencer for presiding at the meeting and for so eloquently advocating the objects of the Exhibition.

Mr. J. Eric Erichsen, F.R.S., said that as Chairman of the Executive Committee of the Exhibition, it gave him very great pleasure to second the vote of thanks. The Exhibition was the joint offspring, as it were, of the Parkes Museum of Hygiene and of the International Medical Congress, which was to hold its first meeting in about a fortnight from the time he was speaking. Thus the Exhibition, by some law which was unknown to natural science, had come into the world before the birth of one of its parents. It had, however, strange to say, inherited the good qualities of both of them, for on one side it represented in its full integrity all the wealth of hygienic appliances to be found in the Parkes Museum, and, on the other hand, everything that could minister to the relief of suffering and the cure of disease, and that could promote the alleviation of deformity and infirmity as it affected man. He could truly say that it was a great Exhibition, for it was the greatest of the kind that had ever been got together. It was the natural outcome of the advance of hygienic science which had characterised modern life, for if there was one characteristic of modern life more than another, it was the great attention paid, at any rate by the educated classes, to the study of the laws of hygiene. The civilised man differed from the savage, and the educated man from the uninformed man, in nothing more than in the scrupulous attention paid to cleanliness in all that related to the health of the body and to the surroundings of the home. The civilised and educated man was impelled by his culture to be clean, and it had become an instinct with him to be so. His knowledge told him that disease was largely preventible by the observance of cleanliness, and that, if preventible and not prevented, it was truly self-inflicted. Disease that was self-inflicted was not always of the major kind. Not merely typhoid and small-pox, but the lassitude, the languor, and nervous depression which were so prevalent were frequently found to have their source in faulty hygienic conditions. The law of hygiene was like the moral law. Just as an infraction of the moral law might lead to the pricking of conscience, so a breach of hygienic law led to illness. He was very glad to hear Mr. Godwin allude to the great influence which might be exerted by women in connexion with hygienic reform, because it was to women we must look for the exercise of home influence. Women should be our great hygienists. It was to the wife, not to the husband, to the mother, not to the father, that we must look for the preservation of hygienic conditions in the home. It was to the mother, not to the father, that we looked for the prevention of disease among the children, and for the adoption of those hygienic measures which would lead the children to grow in vigour and health, strength and beauty, and fitted in body and mind for the duties of after-life. He seconded the resolution with much pleasure.

The resolution on being put to the meeting was carried with much applause.

Earl Spencer, in reply, said he thanked the meeting for the very hearty way in which they had received and adopted the motion for a vote of thanks. His services on that occasion had been very slight, but he felt it to have been a very great honour and pleasure to have assisted at the meeting, and he wished most cordially success to an Exhibition which was calculated to have so very material an influence on the health of the country.

The audience then passed from the Albert Hall to the Exhibition galleries.

SOME APPLIANCES AND MATERIALS AT THE MEDICAL AND SANITARY EXHIBITION.

THE exhibition of which we have in preceding columns reported the opening meeting is so large in scope, and contains so many appliances and materials, that we cannot do more this week than notice a portion of the exhibits. The Sanitary Section of the Exhibition occupies the Eastern Quadrant and the Eastern Arcade of the buildings which, with the large conservatory behind the Albert Hall, enclose the Royal Horticultural Gardens on three sides,—the Medical Section occupying the Western Quadrant, the Western Gallery and Arcade, and part of the Albert Hall. For convenience we now deal with the exhibits contained in the Eastern Arcade, beginning at the northern end.

Messrs. Tonks & Son (Stand 242) are exhibitors of a variety of useful door and window fittings, ventilators, and blind furniture, applicable to hospitals and buildings of all kinds.

At Stand 247, Messrs. J. Bolding & Son exhibit a valve-closet with the overflow made to discharge on to the safe, and thence away over an open rain-water head or trapped gulley. Other closets are shown in action by this firm, including Mr. Banner's improved form of pan-closet made entirely of white earthenware, and which can be readily taken to pieces so as to inspect or clean the container, the interior surface of which is, however, flushed each time the closet is used. At this Stand, Messrs. Graham & Fleming exhibit some remarkably good specimens of plumbing work in the form of soil-pipes and traps. With a view to prevent syphonage of closet-traps where more than one closet is connected to an upright stack of soil-pipe, the latter is bulged so as to considerably increase its diameter at each point where a branch or arm from a closet enters it.

Mr. G. E. Pritchett, F.S.A., architect, exhibits at Stand 248 his patent hot-water system for economising heat and fuel. Corrugated double metal plates are formed with an interval between them for the circulation of water. These plates have a large heating surface, and as they occupy very little space compared with round pipes, they can be fixed without inconvenience behind dadoes and in other positions where pipes would be inadmissible. A full-sized section of the wall of a room with Mr. Pritchett's method of warming and ventilating applied is exhibited in action, and will repay examination by visitors. Mr. Pritchett claims to obtain a *maximum* of warming power, while reducing the expenditure for fuel to a minimum.

Messrs. Thomas Waller & Co. (Stand 249) exhibit a water-closet fitted with an inner pan rim for the prevention of draughts. The space beneath the seat is ventilated, and when the inclined lid is shut down, the pan itself is ventilated into a fine passing up through the wall. This firm are also exhibitors of grill apparatus for chop-houses and hotels, gas-roasters, and other cooking apparatus, including a 9 ft. 6 in. close range. Ventilating and warming appliances are also a specialty of this firm.

Perhaps the largest space occupied by any one exhibitor is that which has been secured by Messrs. Steven Bros., who at Stand 250 display a fine collection of ranges and cooking apparatus, embodying many great improvements, and eminently worthy of the attention of architects and proprietors of large establishments. This firm's Roman bath, in cast iron, enamelled, finished on the outside so as to render casing-in unnecessary and undesirable, is also shown by them.

Messrs. Walter Macfarlane & Co. (Stand 251) have a notable display of goods in cast-iron, including a circular urinal of new and ornamental design, "silverised" screens for various purposes; drinking fountains and horse and cattle troughs of ornamental design; trough closets; and ornamental lamp standards.

The Briton Ferry Coal and Pottery Company (Stand 252) send from South Wales some very good stoneware pottery for sanitary purposes.

Messrs. Doulton & Co. (Stand 253) have a good display of sanitary appliances, including their patent "Vacuum" water-waste preventer, "Lambeth Flush-out," "Lambeth Valve," "Lambeth Trapless," and other closets, and bath and water fittings. They have also a good show of their now celebrated Doulton ware, both in its more purely ornamental forms, and as applied to lavatories and other sanitary fittings, and a quantity of architectural terra-cotta and Lambeth faïence. Everything on this Stand will bear examination, and sustain the reputation of the firm.

Messrs. Beard, Dent, & Hellyer (Stand 254) exhibit their "Vortex" and "Artisan" closets, Hellyer's intercepter trap, water-waste preventers, housemaids' sinks, valve-closets, water fittings, and good specimens of plumbing work.

Hard-burnt architectural terra-cotta work of good colour, sharpness of line, and excellence of texture; also specimens of the "Lambeth majolica," are shown in variety by Messrs. James Stiff & Sons (Stand 255). This firm are also exhibitors of a large assortment of sanitary pottery, including Soper's "Hospital drain-disinfecter," as used at Stockwell Small-pox and Fever Hospitals, and elsewhere; Weaver's "Ventilating sewer-air trap;" Stiff's "Inter-

cepter" sewer trap; and the "Weatherly disconnecter waste-water trap"; together with a double form of the latter, just devised, and called the "Weatherly disconnecting and ventilating drain-trap," which they claim to be the "latest and best" sewer-trap. In it the requirement of disconnection is met by means of two entirely separate water seals at different levels. It should be looked at by visitors.

Messrs. J. Tylor & Sons (Stand 256) make a display well worthy of their reputation. Among their exhibits we may particularly specify their slop or housemaid's sink, with flushing-rim, as used at St. Bartholomew's Hospital; their lavatory-basin, with back outlet and flushing-rim inlet; their patent "Waste not" valve, as fixed for the Corporation of London in several of the courts and alleys of the City, and which only supplies one pailful of water at each movement of the valve; and their automatic district water-meter.

Stand 257 is tenanted by that pioneer of inventors and manufacturers of modern sanitary appliances, Mr. George Jennings, who, it need hardly be said, shows many good things. Besides closets of various kinds, he exhibits in action his patent automatic flushing apparatus for urinals and other purposes; also his patent ball-trap and bath supply and waste. A notable exhibit at this Stand consists of a number of the Du Bois drawn-lead traps, in various forms. These are American products, and well merit the attention of English architects and plumbers.

At Stand 258, Messrs. Robert Boyle & Son make a good display of their well-known and long-tried "air-pump" ventilators. Among many buildings in which their system of ventilation has been successfully applied is the London Custom-House, and some experiments to test the power of the ventilators applied there were not long ago recorded in our columns.

Messrs. Edward Brooke & Sons (Stand 259) exhibit their patent ribbed drain-pipes, which have ribs flush with the outside face of the socket, running longitudinally the whole length of each pipe. The object is to secure strength, to prevent breakage of the socket, and to facilitate laying. The same firm are also exhibitors of a variety of sanitary pottery, including Kirk's "Combined Double-ventilating Sewer-trap and Slop-dish," the invention, we believe, of an architect.

Mr. W. P. Buchan (Stand 261) shows his improved patent drain-pipes, each pipe being made with a small attached block or seat moulded with and forming part of the faucet or socket end. This block is flat at its base. The use of it is that it raises the pipe sufficiently to allow the hand or tool to pass easily beneath the pipe, so as to facilitate the making of a proper joint. Mr. Buchan also shows his ventilating drain-trap, and his "induced current ventilating cowl" for soil-pipes, &c.

At Stand 262 is shown the "Shrewsbury" closet, the invention of Mr. William White, F.S.A., architect. It is provided with special and novel means for securing efficiency of flush, and has previously been described by us.

At Stand 263 Mr. Edward Warner shows a good syphon disinfector for water-closets. The syphon-pipe leading from the reservoir containing the disinfecting agent has one end connected with the pipe that supplies the closet with water, and the passage of the water through the supply pipe causes a vacuum in the syphon, and leads to the discharge of a measured quantity of disinfectant.

The Banner system of sanitation is fully illustrated, both by drawings, models, and the actual appliances used, at Stand 264. Mr. Banner also shows a working model of his proposal for ventilating the Underground Railway. How greatly the ventilation of that line is needed will be known to those who are obliged to travel by it, especially during the present hot weather. Mr. Banner proposes to divide the up and down lines by enclosing them in tubes or cases of sheet metal, and to affix to the engine in front of the driver's footplate, but in the rear of the chimney, a disc or screen nearly the full size of the space enclosed for the line, the idea being that the screen will drive before it all or nearly all of the suffocating fumes given off by the locomotive.

Messrs. W. Ingham & Sons (Stand 266) exhibit a chimney-piece constructed of glazed terra-cotta bricks of ornamental design. This method of construction ensures cleanliness and cheerfulness of appearance, and can be readily adapted to any width of opening. Brown's patent "Accessible" syphon-trap, shown by the same firm, has also a movable lid or cover over the upper part of the trap, giving ready access not only to the trap on the outlet side, but to the drain into which it discharges. McLandsborough's double-trapped ventilating gulley for house and surface drainage is made and exhibited by the same firm. Both these traps are made of salt-glazed stoneware. Another specialty shown by this firm is Adams's "Automatic Trough Flushing Closet," which is made of glazed fireclay, and the contents of which are discharged by automatic syphon action. Some very good terra-cotta chimney terminals are shown at this stand.

Mr. D. T. Bostel (Stand 268), besides exhibiting his improved "Brighton Excelsior" water-closet, shows a new thing in the shape of Holt's patent pneumatic flushing cistern and water-waste preventer. It contains no valve, but is discharged by means of bellows which are compressed by the pulling down of a chain or lever and exhaust the air in a syphon, thus creating a vacuum and allowing the water in the cistern to be discharged.

Messrs. Thomas Smith & Co. (Stand 269) exhibit Herbert Jones's patent drain-pipes and junction caps, and a variety of other sanitary stoneware, including Palmer's gulley and disconnecting trap, in which provision is made to utilise the rain-water falling on the roof of a house as an additional means of flushing the trap, the down-pipe being carried into the drain on the inlet side of the trap. Messrs. Smith are also exhibitors of pottery for chemical purposes, and of terra-cotta chimney terminals.

Messrs. Joseph Cliff & Sons (Stand 270) are exhibitors of some specialties in sanitary pottery, including terra-cotta sinks and baths enamelled inside, and mangers and troughs for cattle, sheep, and pigs. Whether intended to be used by man or beast, nothing can be more cleanly than these articles. This firm also exhibit in great variety architectural terra-cotta, majolica, and faïence; and damp-proof courses and similar necessary adjuncts of a healthy habitation.

The Birmingham Sanitary Association (Stand 271) exhibit Potts's "Edinburgh" air-chambered sewer-trap, which has many good points. It has, we believe, been adopted for use by the Birkenhead and Bolton Corporations, and by many local boards, for use in their public buildings.

Mr. J. E. Ellison (Stand 278) exhibits his conical-perforated bricks and air-grates for ventilation, several times previously noticed by us as a good means of admitting air to rooms without draught. A modification of the same appliance is shown in Mr. Ellison's patent air-diffuser, which admits the air into a room through a grating in the outer face of the wall. Sliding in and out of the opening made in the wall to receive the grating, there is a wooden trunk or box, open at the back, opposite the grating, and admitting fresh air into a series of wedge-like chambers formed between two circular plates of wood or other material by radial divisions. The front of this apparatus, facing the interior of the room, may be made to assume the form of a mirror or decorative medallion.

Messrs. Wilcock & Co., of Burmantofts, Leeds, exhibit (Stand 279) their "Sanitary Trough-closet" (Holroyd's patent), admirably suited for situations where anything less simple would get out of order by reason of rough usage. It need hardly be said, however, with regard to trough-closets, that the caretaker who has charge of the keys of the valve-chest should be a person who can be relied upon to flush out the troughs at stated intervals. The same firm are exhibitors of a variety of sanitary pottery, including a stoneware street-gulley, as used by the Leeds Corporation. They have also a good show of majolica and faïence adapted for architectural work.

The Thames Bank Iron Company (Stand 280) exhibit their improved base-burner gill-stove and other stoves for warming by hot air; also saddle-boilers, coils, &c., for warming by hot water. Their laundry roof, with gear for ventilating, is simple and handy in contrivance. Such articles as sluice-valves, manhole-doors and frames for sewers, gulley grates, &c., are exhibited at this stand in profusion.

Messrs. Shanks & Co., of Glasgow (Stand 281), exhibit baths and bath-fittings, including a very convenient sitz-bath of, we believe, American device. This firm's specialties seem to be valve and other water-closets, housemaid's sinks, lavatory basins, &c., in earthenware, encased on the exterior with iron to diminish liability of breakage.

Messrs. Maguire & Son, of Dublin (Stand 282), exhibit their patent "safety-joint" drain. The drain-pipes are of ordinary salt-glazed stoneware, each alternate pipe having an inspection cap or cover, which enables the workman or the supervisor of the work to satisfy himself beyond doubt that no cement forced up into the pipes by the insertion of the spigot into the socket to make the joint is left inside the pipes to impede the flow of sewage. Security from danger to the joints externally is afforded by the stoneware "cradles" in which the lower halves of the socket-joints rest, the space in the "cradles" not occupied by the pipes being filled up with cement concrete, completely enveloping the lower halves of the joints, the upper halves being afterwards cemented over on the exterior. By these means a very strong and perfect joint is secured. The same firm's patent self-flushing tank is shown in action, and should be seen by visitors. Among other of their exhibits we have only space to mention their "improved safety disconnecting receiver" for bath-wastes, their portable and fixed disinfecting apparatus for hospitals and other institutions, their patent renewable water-filter, and specimens of "Anti-corrodo" (Barff's rustless) tubes and fittings.

The Shone Drainage, Sewerage, and Water-Supply Company (Stand 284), show their hydraulic and pneumatic sewage ejectors. They are the inventions of Mr. Isaac Shone, C.E., and have been applied at Wrexham. We understand that sewerage works upon this principle are in course of construction at Eastbourne and Winchester. The apparatus, which is shown in the Exhibition by working models, is also applicable to purposes of water-supply. A flushing-tank, the syphon of which is started by an automatic tipping basin (the invention, we believe, of Col. Jones, V.C.) is also shown in action.

Mr. J. Charlton Humphreys, besides exhibiting (Stand 285) specimens of corrugated galvanised iron as applied to the construction of temporary hospitals or other buildings, has been entrusted with the work of enclosing the northern portion of the western arcade for the use of the Medical department of the Exhibition.

The Sanitary Engineering and Ventilating Company (Stand 286) are exhibitors of the "Imperial" vertical tubes and other appliances for ventilation, and of their method of "house drainage on the air-flush system."

The Silicate Paint Company (Messrs. J. B. Orr & Co.) exhibit (Stand 287) their non-poisonous paints and colours, including "Charlton white," oils, pulp-colours for paper-stainers, silicate paints and enamels, and silicate distemper,—which possesses the sanitary merit of being washable. It can be executed in any design or colours.

Messrs. Frederick Walton & Co. (Stand 288) exhibit specimens of their "Linerusta-Walton," a decorative material for walls, &c., which has more than once previously been noticed by us with commendation. While capable of an infinite variety of treatment in design and colour, it has important sanitary merits.

The Sanitary Paint Company (Griffiths, Berdoe, & Co.), (Stand 289), are exhibitors of sanitary and enamel paints and petrifying liquids. Among their specialties may be mentioned silicate distemper (washable), Griffiths's vermilion, stated to be about half the price of ordinary vermilion, and not liable to fade in the sun; "Stegonite," a cheap paint in all colours for iron and metal work generally; and Griffiths's zinc white, a desirable substitute for white lead.

The Albissima Paint Company (Stand 300) show their "Sanitary Paints," made from zinc. It is claimed for them that they are absolutely non-poisonous; that their covering power is from 25 to 50 per cent. superior to the best white lead; that they are durable and unaffected by impure atmosphere; and that they are very easy of manipulation. This paint seems to be a good material.

Messrs. Candy & Co., of the Great Western Pottery Works (Stand 301) exhibit, among a quantity of sanitary salt-glazed stoneware, the "Registered" sewer-gas excluder, with double water seal. This is a very useful disconnecting trap. The "Chudleigh" soil-pipe trap and sewer ventilator, for fixing at the bottom of vertical soil-pipes; and the "Mason's Trap," a substitute for the old-fashioned brick and cement trap, with inspection hole and ventilating opening, are also among the exhibits of this firm, who also show damp-proof bricks of stoneware and terra-cotta, with vitrified and salt-glazed

surfaces. These combine great usefulness with comparative cheapness.

Messrs. John Finch & Co. (Stand 302) show their "Royal Porcelain" bath, made in one piece of fire-clay, with *bisque* glaze on the interior. For cleanliness nothing can surpass it. The same firm are also exhibitors of bath fittings, porcelain sinks, ventilating drain-traps and pipes, glazed bricks for sanitary and other purposes, and of a self-acting water-closet flushed by the movement of the seat

Messrs. John Bryden & Sons (Stand 303) exhibit a variety of useful inside and outside blinds, and some improved fittings for facilitating the opening and closing of the same. This firm are also exhibitors of wire hang and electric and pneumatic bells and indicators, apparatus for opening window-sashes, &c.

Mr. A. T. Angell exhibits at Stand 304 his patent air-tight cast-iron sewer flap.

Mr. Henry Seward, F.C.S. (Stand 305), shows full-sized models, and specification and drawings of his patent "Disinfecting Vaporiser" as applied to street-gullies, water-closets, &c. The apparatus consists of a vessel to hold a supply of carbolic acid or other volatile disinfectant, so protected as to prevent water passing into such vessel, but allowing the vapour of the disinfectant to freely and continually escape. As applied to a street gulley the vessel to contain the disinfectant takes the shape of a narrow trough surrounding the upper part of the gulley hole, and protected from the influx of water by being placed under the shelter of the framework of the grid. As applied to D or syphon-traps of water-closets, a similar gallery or trough is provided to contain the disinfectant just at the entrance of the closet pan or basin into the trap. As applied to a pan-closet it consists of a small box or chamber attached to the upper part of the interior of the container, a vertical pipe being led up through the top of the container to the level of the seat for the purpose of replenishing the box when needed.

Mr. Edward Howard (Stand 306) exhibits the improved "Duplex" lid and automatic flusher for water-closets, adaptable also to housemaids' sinks, lavatories, urinals, &c. The apparatus is the invention of Mr. H. Saxon Snell, architect. The lids or covers are so contrived that when shut down the water-closet pans, the sinks, or the lavatory-basins, as the case may be, are completely shut off from the house, and a flue is provided to convey away any effluvia which may arise from them. The action of shutting down the lid, in the case of a water-closet, empties and flushes the apparatus.

Mr. Frederick Dyer (Stand 307) exhibits his arrangement for preventing kitchen-boiler explosions. The chief feature of the system consists in the substitution of an upright cylinder, placed near the boiler (say in one of the recesses by the side of the kitchen chimney-breast) for the usual hot-water circulating apparatus. The boiler, which for greater economy of fuel and rapidity of heating is made with tubes running through it from the fireplace into the flue, is of course in connexion with the cylinder, and has an ordinary flow and return. From the top of the cylinder, and also from the boiler direct, the hot-water is caused to circulate throughout the house and back again to the boiler. Mr. Dyer also shows a tidal trap-valve for sewage outfalls. It consists of a solid india-rubber ball, suspended by a hinged lever somewhat in the manner of an ordinary plumber's ball-valve, and which, on the influx of the tide into the outlet, is made by the pressure of the water to impinge tightly against a gun-metal seating.

Mr. John Parker (Stand 313) shows his self-acting dry earth-closets in various forms. Either earth or ashes can be used with this apparatus, and provision is made for separating the liquid from the solid matters.

Mr. J. R. Pickard (Stand 315) is an exhibitor of a domestic fire-grate intended to consume its own smoke and to prevent down-draught, a concomitant advantage being, of course, economy in the consumption of fuel. The only outlet into the chimney is through a movable perforated fire-back, which may be of iron or fire-clay A damper is provided for regulating the draught to any required degree. The inventor claims that this arrangement is applicable to all existing furnaces, stoves, and ranges. It is, of course, intended to burn any kind of coal. The same exhibitor shows a model of his patent tubular atmospheric smoke-consumer as applied to boiler furnaces, and a model of his "Gormand" furnace for consuming by "cremation" town refuse of all kinds. An ash-closet and a carbonising oven are also shown by him.

Mr. Alfred Shaw (Stand 316) exhibits a "self-contained mechanical dry closet, requiring no water-flush." It is made entirely of metal and earthenware, and is very costly, and we are afraid that its costliness will not be compensated for by its efficiency.

Moule's Patent Earth-Closet Company exhibit at Stand 317 their earth-closets and commodes in a variety of forms and materials.

At the Journeymen Plumbers' Stalls (320, 321, 322), which were not complete at the time of our visit, and particulars of the contents of which are not contained in the first issue of the official catalogue, several working members of the plumbing craft have sent in specimens of what they have been able to do in competition for the prizes offered in connexion with Mr. Hellyer's lectures under the auspices of the National Health Society. The specimens of work vary somewhat in execution, but many of them are very good. Mr. S. Fairchild, a journeyman plumber, exhibits a design for a system of sanitary plumbing applicable to a town mansion. He would place all the water-closets and other offices in a separate wing or tower, separated from the main building by double doors forming a lobby, giving cross-ventilation to this lobby by means of windows on each side of it. All soil and waste-pipes are shown trapped, ventilated, and disconnected from direct connexion with the drain.

Mr. James Woodward, of Swadlincote (Stand 323), shows his patent wash-out closet, which is simple and effective. He also exhibits a very useful "wash-up" sink, consisting of a basin with a corrugated surface or slab, on which to place cups and other vessels to drain after being washed.

The Antiseptic Apparatus Manufacturing Company exhibit in action at Stand 324 their simple appliance (of which we have spoken favourably on previous occasions) for preventing foul smells from water-closets. It can be easily fixed to any kind of water-closet.

Stand 325 is occupied by Messrs. Smith & Barnes, who exhibit a system of joint-making in plumbers' work without the use of metal pot and irons.

Mr. F. G. Underhay (Stand 326) exhibits valve and other closets and water fittings in great variety, and of a quality fully sustaining the repute of the exhibitor.

Messrs. C. H. Sharp & Co. (Stand 327) show a combination water-closet, slop-sink, and urinal, and, among other things, their "Crown Ejector" ventilator.

At Stand 328 Messrs. Ihlee & Horne have a dark room in which they show the luminosity of Balmain's patent luminous paint, as applied to, among other purposes, hospital ward ceilings.

Messrs. Hayward Tyler & Co. (Stand 329) show among their specialties a new form of closet, named by them the "Full-Flush Valveless Closet," which is virtually a greatly-improved form of hopper-closet, with very superior means of flushing. The basin closely resembles in shape that of a valve-closet. This closet can be fitted in the space occupied by any pan-closet. The same firm exhibit several other things worth attention.

Mr. Henry Owen (Stand 330) shows his new patent trapped urinal, slop-sink, and lavatory combined. When not in use the urinal is concealed. The lavatory-basin is made to tip-up and discharge through a spout at the back into the urinal. The same exhibitor has on view his double-trapped and single-trapped water-closets, and his gully and fat-trap combined.

Messrs. John Warner & Sons (Stand 333) exhibit water-closets in great variety. A portable water-closet or commode shown by them has many good points to recommend its use in the sick-room. This firm also show a public water-closet, and self-acting water-waste preventer; a pan-closet with an earthenware container; and bath and water fittings of excellent construction. Visitors not yet acquainted with it should inspect a very valuable appliance made by this firm, viz., Randall's patent boiler safety-valve and tap, the general adoption of which would, we believe, prevent many a disaster.

Messrs. Bowes Scott & Read (Stand 340) show in action a self-acting flushing-tank or chamber, fitted with Mr. Rogers Field's patent annular syphon. It appears to thoroughly fulfil its purpose.

Messrs. Henry Sharp, Jones, & Co., of Poole, Dorset (Stand 341) are exhibitors of their well-known "Rock Concrete" tubes for sewerage purposes. They also show glazed stoneware pipes (fitted with Stanford's patent joint), and other sanitary goods, such as traps, gullies, &c.

At Stand 342, Purnell's syphon water-waste preventer is exhibited in action.

Messrs. Steel & Garland (Stand 346) have a good display of slow combustion and other grates, notable among them being the "Wharncliffe" patent warming and ventilating grate, which has lately been improved so as more readily to permit of the cleaning of the flue when anthracite coal or other smokeless fuel is not burnt in the grate. This firm are also exhibitors of fenders and fire-irons, tile-hearths, and mantelpieces in oak and marble.

Messrs. H. Braithwaite & Co. (Stand 347) show their patent syphon for water-closet and urinal cisterns, Claughton's patent stench-traps, and a "wash-out" closet.

We shall next week speak of the sanitary appliances and materials exhibited in the Eastern Quadrant.

HOSPITAL AND OTHER PLANS AT THE SANITARY EXHIBITION.

WE naturally turn, in the first instance, in making some notes at the International Sanitary Exhibition, to the department in which plans of buildings arranged with a view to sanitary conditions are exhibited. These are to be found in the upper floor of the Western Gallery, around the room in the centre portion of which are exhibited various classes of surgical instruments. There is, therefore, in this department something like an attempt at classification, though this does not extend to the catalogue even here, as the titles and descriptions (where there are any) of the plans are interspersed with various other matters which are in quite a different part of the exhibition. It is a great pity that more systematic effort at arrangement was not made. It is difficult to know where to find anything in the catalogue when it is seen in the room, and impossible to guess from the catalogue where to look for any object that is mentioned and that we may wish to see. Fortunately, a large proportion of the objects exhibited are accompanied by written or printed descriptions, and in many cases there is a custodian who is ready, in some cases we might say eager, to supply information, and thus it is possible by little and little to extract some of the instruction or illustration which the Exhibition is intended to convey.

The department of plans, however, is worst off and least useful of all in this respect. Architects naturally do not attend to explain their own plans, but there should have been more effort to render the plans self-explanatory. We have a good many plans of hospitals, for instance, many of which present very similar characteristics in general arrangement. Their superiority or inferiority respectively would depend very much on details of construction, ventilation, material, &c., which in many cases are not shown at all. A good many of the plans of buildings erected by Mr. Saxon Snell, for instance, and which we noticed recently in reviewing his book on "Charitable and Parochial Institutions," are hung on the walls; but without some of the detailed descriptions of the means employed to secure ventilation, which we had previously learned from the book, one might have condemned some of the plans as showing a strange indifference to the understood sanitary requirements in the plan of such buildings. A copy of the book; which might have given those who were interested in the plans (such as that of the Holborn Infirmary some further information about the systems adopted, we did notice on a table in another room, far away from the plans which the book illustrates, and among other objects having no connexion with it; and this seems rather typical of the general arrangement of the Exhibition.

We call attention to this point in the Exhibition, because if ever or whenever this kind of exhibition is attempted again, there ought to be a systematic endeavour to illustrate sanitary planning in a proper manner. It is not enough, indeed, it is of very little use, that architects should send general plans to be hung on a wall and looked at. It should be a rule, in inviting contributions to such an exhibition, that architects' plans should not be admissible unless accompanied by detail drawings showing in full the various ventilating schemes, heating apparatus, &c., and giving an intelligible description of the principle and method adopted. Without

such details and descriptions the hanging of the plans is of very little use. They are provided in some cases, but in many they are not, and some of the plans which might be among those of the most importance are so unpractical in their style and manner of delineation that they are nearly worthless for the purposes of the Exhibition, or for enabling the judges to come to any conclusion on their merits. There are plans by M. Tollet, for example, for a hospital at Montpellier, which, however, are not catalogued under his name, but under that of Dr. Mouat. After what has been claimed recently on behalf of M. Tollet's system of hospital planning, some special interest should attach to any illustration of it. But what we find in the Exhibition is only some very minute general plans, so small and so imperfectly drawn that it is difficult even to make out the intention in some parts of them, and quite impossible to understand anything of the detailed arrangements. As far as it is intelligible, it does not appear that the principal blocks are any more isolated or cut off from each other than in many other hospitals on the pavilion system,—indeed, not so well as in some of them in this country, for there appears to be a gallery running past the ends of the blocks, and opening directly on them all in succession. Certain departments for specially infectious diseases are treated as separate small houses, without any communication at all between them; this is the only specialty which we can make out from the plans. But such plans are simply useless for an exhibition of this kind.

The various plans by Mr. Snell, which come first in order on the walls, we have recently commented on sufficiently in referring to his published illustrations of them. The next specimen we come to is No. 57, plans by the Freehold Cottage Dwellings' Company, of workmen's cottage dwellings to be built in brick or in Haughton's patent concrete; six different classes of houses, costing in brick from 150*l.* to 285*l.*, and in concrete from 135*l.* to 255*l.* The plans are not very good; there is space lost in passages, and the water-closets are in too close and confined corners to afford a ready circulation and change of air, and in some of the plans they open from the scullories, which we quite disapprove of. Another set of artisans dwellings of much superior merit to these, is that numbered 60, by Mr. Rowland Plumbe, for the Artisans, Labourers, and General Dwellings' Company. These are well and economically planned houses, though the architect seems to have had difficulty with his larder; in one set of plans it is deficient in through ventilation, in another set it is specially contrived so as to secure through ventilation, but it is placed in too close contiguity to the water-closet to look quite safe. The exterior of the houses looks well, but evidently owes something in its effect to the prettily-executed perspective drawings; the houses have, however, the appearance of solid and substantial building. Under No. 61 are some plans for three-roomed dwellings for artisans by Mr. Mark H. Judge, providing two separate and distinct dwellings one over the other, each with separate street entrance, scullery, yard, and offices. These we published some time ago. The houses are as ugly as anything could be, but are satisfactorily planned in the main; it must be observed, however, that the water-closet accommodation is on the ground floor for both of them, and that the route to it from the upper house is somewhat roundabout. They might easily have been contrived to have the water-closet in similar position on each floor, which would have been very much better.

Some good suggestions in the way of dwellings for the poor are embodied in the plans by Mr. Lawrence Booth for Manchester and Salford Working-men's Dwellings Company. Mr. Booth adopts small blocks of six houses each, arranged in three stories, the central staircase, which is unroofed, dividing the block in two halves. He recommends small block systems, as they can be adapted to any size of site, by placing a greater or less number together. Each tenement contains living-room and bedroom, with separate water-closet with external entrance; the living-room fireplace is well contrived as an angle fireplace to take up very little room, and to send warmed air into the bedroom, which also has an exhaust-flue at the further corner. The houses are meant for a very cheap class of tenement, at about 2s. 6d. a week, and they are too small and too close at back, but they may be regarded as successful to a certain extent.

Among the hospital plans, we have one of some importance, for which Dr. G. V. Poore and Mr. Waterhouse appear to be jointly responsible (59), for reconstruction of the University College Hospital on its present site. The plan is stated to have been determined in its character in some degree by the nature of the present site, which in some respects left no choice in regard to arrangement. In the report appended, the authors refer to the opinion that hospital wards should be in one-story buildings, and observe that "this rule might be followed if cost were no object, *and if there were no high buildings in the immediate neighbourhood*," the latter sentence being italicised in the report. We fully agree as to the very great difference in the conditions when there are high buildings already existing contiguous to the site. The advantages of one-story building must be very much neutralised in such a case, but the question then arises why should a hospital be built under such conditions? The principle of the scheme is, we may say, almost as a matter of course, the pavilion system, the building resembling the letter E, the three pavilions pointing towards the open space in front of University College, so that "every part of the building is thus made accessible to what pure air there may be on this space," and the building is so arranged that it should be impossible to pass from one pavilion to another, from one ward to another, or from one story to another, without going into an open corridor. "It might be objected that great inconvenience would thus be caused to those who have to visit the wards; but a doctor visiting the wards of a hospital should regard himself rather as walking from house to house than from room to room, and should be clothed accordingly." The scheme appears to be well carried out in the plans. The only point we are disposed to question is the planning of the lavatory blocks at the ends of the wards, in which the w.c. can only be reached through the bath-room, and is not very well ventilated in its approaches. It is surprising, we may observe, how seldom this portion of hospital adjuncts is really well planned, even in cases when every attention is supposed to have been given to securing the best possible arrangement. Another point in the scheme seems to us doubtful,—the omission of any nurses' rooms in connexion with the wards. The reason given is that when the nurse is on duty her proper place is in the ward, and when not on duty she is better out of the hospital. It seems to us hard on the nurse that, in the course of long hours of duty, she should not have a small space for herself, apart from the general ward, on occasions when she is not at the moment engaged in any ministrations, and the room may surely also be very useful for the orderly bestowal and arrangement of things wanted for use in her work.

Mr. Ernest Turner's plan for the small Fever Hospital at Newton-road, Devon (64), is a thoroughly practical one. There are open corridors with wards at opposite ends, the administration portion of the building opening out of the centre part of the corridor; the wards have a nurses' room and a bath-room, with a bath on wheels, in the centre of each ward block, dividing them practically into two smaller wards. The small blocks containing water-closet and sink are put at the angles of the wards, not obliquely, but so that the corners of the blocks are just sufficiently in contact to give room for passage through, and they are very well planned and isolated.

The plans for the North Staffordshire Hospital, by Mr. H. C. Robins, are not only good in a sanitary point of view, but form also a pretty and effective building in an unpretending style. The windows are formed in bays, V-shaped on plan, with the object of enabling patients in bed to see out of window to some extent; a good idea. The same architect exhibits two or three other plans of buildings of the same class.

The plans for the Salford Union Hospital, by Mr. Lawrence Booth, are evidently suggested by the general disposition of St. Thomas's Hospital, which the architectural treatment to some extent imitates. The plan would have been more satisfactory, in fact, if it had more closely imitated the Lambeth building in having the ground-floor corridors of communication open; in this instance they are closed. The water-closet blocks are at the angles of the wards, placed obliquely. The oblique position has been, however, condemned by sanitarians, as it affords more facility for the communication of fouled air from the window of the water-closet to the ward windows than when the two are in the same parallel line. The ventilation scheme is not very clearly indicated; there are fall-back upper sashes to the windows, there appear also to be inlets at the ground-floor, and there is an extract in the roof from the upper-story ward, but what is the extract from the lower wards is not so manifest.

The plans of the West Herts Infirmary, and the South Devon and East Cornwall Hospital, by Messrs. Coe & Robinson, do not present any special points for comment; they seem fairly good. Mr. Chisholm's plan of the Lying-in Hospital at Madras is a very effectively got up plan, with lots of shading and tinting, but unfortunately attractions of that kind do not help one much in determining the sanitary qualities of a plan. We can see that the whole is largely built of wood and enclosed in verandahs, the first point probably unavoidable, the second in every way desirable; and we can see that the hospital is divided into small wards of four beds each, and we learn from the catalogue that the rooms adjoining each such ward are a nursery and scullery, and that the central block contains the labour wards, and is connected with the other four pavilions by covered ways. There are some indications of a means of screening the patient actually under "the pain and peril of childbirth" from the other occupiers of the same ward; at least, we took certain marks in the plan to be indications of a screen, but may be mistaken. From the small block plan appended, it appears that the latrines are in a separate detached block entirely away from the main building; in hot climates this would, no doubt, be the best arrangement for dwellings for people in health, but it is difficult to understand how this can work for invalids. No details of these or of any other practical matters are given.

The National Hospital for the Deformed, proposed to be erected in Great Portland-street (73), is shown in a very complete set of plans; no architect's name in the catalogue. As a hospital plan in the ordinary sense, it would be deficient in isolation of the various parts, but possibly it is considered that a hospital for the treatment of mechanical ailments only may be regarded in the same light as a dwelling for healthy people. As such cases involve surgical treatment, however, this argument would not hold.

Dr. A. Tripier, a French sanitarian, exhibits one or two sections showing plans for the ventilation of theatres and hospitals. The sections show little or no detail, but are accompanied by brief descriptions. The hospital ventilation is operated by a large central duct or ventilating flue going up through the centre of the floors, with openings into each room. This is the inlet, and is intended to be a descending shaft in summer, with the influx accelerated if necessary by mechanical means (not described), and an ascending shaft in winter, sending artificially warmed air up from below; the extract in both cases is the same, through the outer walls near the floor. To make this act, the mechanical propulsion in summer would be always necessary, we should surmise, otherwise there seems no particular reason why the outlets should not become the inlets, and *vice versâ*. With this reservation, there is a simplicity and an equality of air-service for each floor which seems to recommend it. The sketch by the same exhibitor for the ventilation of a theatre, adopts the principle of influx from the stage, and from over the proscenium, to the centre and circumference of the house; and extract around the circumference by ducts leading to a central extract in the roof over the auditorium. The principle is right as to its general form. There is nothing to show whether propulsion is to be adopted, or merely natural influx; the former would probably give the most successful results, but is costly. There is another theatre scheme hanging at a little distance from this,—that of the Théâtre de la Monnaie, at Brussels,—which is stated to have given great satisfaction to its audiences, in the way of ventilation, for some years; but, unfortunately, the plans explain nothing, in spite of the number of arrows with which they are covered.

Among the remaining exhibits in this department is Captain Galton's large plan of the Herbert Hospital at Woolwich. No details are given. As a plan it is hardly up to the mark in the planning of the latrine lobbies, which are deficient in through ventilation. There is a plan (81) for carrying out Professor Marshall's circular ward system, by Mr. Francis E. Jones, which seems to us superior to Mr. Snell's plan. It places the circular wards at the four angles of a parallelogram, the administrative buildings taking the form of a cross in the centre space, with connecting corridors to the circular wards.

A perspective view of the building is given, which is not ineffective, but wanting in homogeneous character. There are drawings of the Camden Turkish Baths, and of a proposed hydropathic establishment at Bournemouth, by Mr. H. H. Bridgman, which are worth attention, and some views of the interior of the "Roman Bath" at Vienna, which serve to suggest what delightful internal architectural effect swimming-baths are capable of when economy is not a rigidly-enacted condition. Mr. H. G. Brace exhibits (66) section and details of a house, showing a system of ventilation which is at least intended to be very complete, but seems to err on the side of complication in the number of its inlets, and the extraction into the smoke flues is not to be recommended. We will illustrate, and our readers may judge for themselves. An admirable and most practical bit of sanitary illustration is Mr. Turner's small plan (64) of drainage system as applied to an ordinary house, with the manholes of interception shown, and the drains carefully distinguished under various classes by colouring. It is a pity there are not more detail drawings of this sort got up with the same care and finish. A curiosity of the Exhibition consists in the number of sheets of pen sketches contributed by Dr. Bastien, and said to be drawings of apparatus for the Ambulances Parisiennes. A good many of the sketches, however, look like jokes, and scarcely any of them are comprehensible in the absence of any description.

GLASGOW MUNICIPAL BUILDINGS COMPETITION.

THE conditions of the preliminary competition, drawn up, we believe, by Mr. Charles Barry and the Glasgow City Architect, have been published. We have already stated the terms decided on,—a preliminary competition of sketch designs, open to all, and a final competition between not fewer than six and not more than ten selected for the purpose. To each of the selected competitors 150*l.* will be paid towards his expenses. The architect placed first in the order of merit by the architectural assessor or assessors to be appointed for that purpose, is to be employed to execute the new building as architect unless some insuperable obstacle shall arise; in which case the author of the design second in order of merit shall be employed, and so on. The sketch designs are to be sent in by November 30th. Full particulars will be found in our advertising columns. If we have an unknown genius among us, he may now show himself.

PROSPECTIVE LARGE EXPENDITURE BY THE METROPOLITAN BOARD OF WORKS.

THE money bill of the Metropolitan Board of Works, which has just been introduced to Parliament, shows an unusually heavy prospective expenditure. Amongst the sums applied for under the Bill is 9,000*l.* as the cost of the sphinxes about to be placed on each side of Cleopatra's Needle. For the purposes of main drainage and sewerage, 100,000*l.* is asked for. For the re-building of Battersea and Putney Bridges, under the Bridges Act of last session, 760,000*l.* is required; also 34,200*l.* in respect of the new Hackney Commons; whilst 100,000*l.* is asked for in the Bill for "minor improvements" and contributions to local improvements. For parks, commons, and open spaces, 15,000*l.* is wanted; and 30,000*l.* for works in connexion with the Fire Brigade. The large sum of 1,500,000*l.* is also asked for to be expended in street improvements; whilst 300,000*l.* is required in connexion with artisans' dwellings. In addition to these borrowing powers, the Bill asks for powers to advance loans to vestries and district boards to the extent of 200,000*l.*; to boards of guardians 150,000*l.*; to the managers of the metropolitan asylums 50,000*l.*; to the London School Board 600,000*l.*; and to other public bodies 100,000*l.* The actual amount of the Board's borrowing powers provided by the Bill is 4,536,334*l.*

Windsor Castle.—The roof of the Guard-house, containing about 5,000 ft. of some kind of asphalte, is being stripped, and in its place the quality supplied by Claridge's Company will be laid.

TECHNICAL EDUCATION: THE NEW INSTITUTE.

ON Monday afternoon last, with a considerable amount of ceremonial, befitting to so important an occasion, H.R.H. the Prince of Wales, President of H.M. Commissioners for the Exhibition of 1851, fixed a granite shaft of the Central Institution of the City and Guilds of London Institute for the Advancement of Technical Education, the site of which, upon the estate of H.M. Commissioners for 1851, has been granted by the Commissioners to the City Guilds at a nominal rent. Originally the site had been fixed upon that side of the estate which is farthest away from the museums and libraries belonging to the Science and Art Department. Fortunately this obvious error has been corrected, and the students of the new institution will find the South Kensington collections and libraries almost contiguous for reference.

A numerous company, representative of the state, the civic, the scientific and artistic forces engaged in promoting national education, was gathered together to do honour to the occasion. The chief burden of the proceedings was borne by H.R.H. the Prince of Wales and the Lord Chancellor, who is Chairman of the Council of the City and Guilds of London Institute. The two speeches, made by H.R.H. the Prince of Wales and by the Lord Chancellor were, from some points of view, by far the more important of the incidents of the occasion.

Lord Selborne spoke of "the objects of the Institute as being the improvement of the industrial and commercial pursuits of this country, by affording facilities to apprentices, foremen, managers of works, and manufacturers, to become practically acquainted with the principles of science and art in their application to industrial operations." This extended description is reduced in his lordship's next sentence to "a system of education for artisans, intimately associated with the purposes for which some of the guilds were originally founded." In mentioning the earlier labours of the guilds in promoting "technical education," the Lord Chancellor called the object of their labours, "technical science and art," "technical instruction," and "technical education." Some of the instructional work done by the guilds was described by Lord Selborne specifically; such as the application of chemical science to manufactures, and the application of electrical science to the transmission and conservation of energy. At the new Institute, the Lord Chancellor said, it was intended to provide means for imparting to persons engaged in professional or commercial pursuits "a knowledge of some branch of mechanics, physics, or chemistry," which "in its practical application will be found not only serviceable, but almost indispensable," to their pursuits. "Here," he continued, "it is expected that artisans who have shown merit, and have won distinction at the branch or provincial colleges, will complete the training which may qualify them to act as managers and superintendents of works. . . . . Here it is anticipated will be trained that body of technical teachers of whom there is in England at the present moment so great a need, who will carry with them from this College into the manufacturing centres, to be there imparted to other students, a knowledge of the theory and practice of the various crafts and industries. . . . . The aim of this institution will be to supplement the teaching of the excellent schools [of science and art] situate in the neighbourhood, by giving instruction in the practical application of science and art to the trades and industries of the country, and by cultivating and endeavouring to stimulate inventive genius."

To this address his Royal Highness the Prince of Wales replied, and in the course of his speech made the following remarks which bear upon the meaning of "technical education":—"Hitherto English teaching has chiefly relied on training the intellectual faculties, so as to adapt men to apply their intelligence in any occupation of life to which they may be called. . . . . Both in Europe and America technical colleges for teaching, not the practice, but the principle, of science and art involved in particular industries, had been organised in all the leading centres of industry. England is now thoroughly aware of the necessity for supplementing her educational institutions by colleges of a like nature. Most of our great manufacturing towns have either started or have already erected their colleges of science and art. In only a few instances, however, have they become developed into schools for systematic technical instruction."

There can be no disrespect in candidly avowing that it is not an easy matter for any one to obtain a distinct idea of the exact drift of either of these speeches. Both, of their kind, are authoritative, and must have some effect in moulding a public opinion as to the meaning of technical education. A leading theme of the Lord Chancellor's remarks is that a "technical" or "special" course of instruction for artisans and managers of works is required. In an opposite direction, H.R.H. the Prince of Wales is reported to have said that "English teaching has chiefly relied upon training the intellectual faculties," implying thereby apparently that handicraft had been neglected in favour of overburdening Englishmen with intellectual training. Surely as a matter of historic fact, not to say experimental truth, the force of which has raised our manufactures so high in the estimation of the world, the point in which English workmen excel has been soundness and completeness of workmanship. To enable this quality of workmanship effectually to compete with the less solid, but nevertheless at present more remunerative, workmanship of other countries, is no doubt the aim of the so-called "technical educationalist." This aim, in so far as English workmanship or handicraft is concerned, resolves itself very much into one of economy of labour. British handicraft has, it appears, enjoyed its prestige chiefly on account of its extravagance of completeness. Its goodness was wastefully good. These facts modern science has brought to light. Modern science is responsible, therefore, for remedying the defects. But no confusion should exist by which it may be sought to make modern science identifiable with City guilds, or *vice versâ*. The guilds have not kept that watch which would qualify them to receive the accolade for their scientific and educational proficiency. Indeed, they have hardly defined the object of their quest. A principal gist of technical education certainly seems to be to infuse into our workmen a leaven of economy in their expenditure of labour and their employment of material. The very demon of shoddiness, which Carlisle execrated, has perhaps his good economical points; and it is the discovery and dissemination of a knowledge of these good points which English handicraft probably requires. With some such simple idea before them, the managers of the City Guilds Institute may hope to serve the cause of English handicraft. For the present, let them rather shut their eyes to the somewhat Quixotic pretence of being able to train handicraftsmen, and, in a sort of carrying-coals-to-Newcastle manner, of supplying the manufacturing centres with *teachers* (?) of "crafts and industries," as mentioned by Lord Selborne. A course of action for the City guilds who wish to cast off the odium of a longish series of extravagant banquets, and to return to an intelligent interest in their various trades, is traced in a perfectly straight direction by the finger-post, "economy in labour and material." This means providing handicraftsmen with thorough instruction in certain fundamental scientific principles which experience has shown can affect the processes of their labour and the materials of their use.

With no desire to unduly disparage what the City guilds have already done, we can safely affirm that the chemical lectures and laboratory practice at Cowper-street Schools, the metallurgical lectures at King's College, the art instruction at Lambeth, are not distinguishably different from chemical lectures, laboratory practice, metallurgical lectures, and art instruction given under the auspices of the Government Department of Science and Art. As to the technological examinations, through some unfortunate little fit of jealousy, the City guilds made an initial mistake when they undertook to take them over from the Society of Arts, by altering their plan, which had been carefully devised by the highest scientific authorities. It is certainly to be hoped that the City Guilds Institute may, as Lord Selborne said, supplement the teaching given in the Training Schools for Science and Art under the Science and Art Department. But how or when this may be expected, when at the onset the City guilds have had the temerity to reject the highest scientific advice, it is hard to say. Nevertheless, time works wonders, and between last Monday's ceremony and the opening of the South Kensington laboratories, lecture-hall, theatres, and classrooms the "Divinity that shapes our ends,

rough-hew them as we will," may have led the managers of the Institute to see the technical wisdom of taking the advice which experience can offer them; as well as the non-technical and extravagant futility of contentedly believing that the blind can lead the blind.

WINCKELMANN.

WINCKELMANN'S is a name which, for more than a century, has borne with it the respect of the world,—a respect paid to it quite as much, we suspect, on reputation, as on familiarity with his books. Since the publication of the great German's works, the researches of later students have gone far to render somewhat antiquated his views. We know that with all the enthusiasm and earnestness he possessed,—so necessary a quality in studies of this nature,—the funds of information at his disposition were limited; we know how many elements in the development of the history in which he was so interested were unknown to him; we know that writers who have succeeded him are now set aside by reason of the advance that the science of archæology has made within this century,—since, in fact, he himself gave the first great impetus to the study. But still the reputation of Winckelmann stands foremost among the names of those who have searched antiquity for the lessons it may teach. We respect as we do in his great predecessor, the learned Benedictine Montfaucon, the enthusiasm that he showed in his pursuit, but we feel unconsciously that he belongs to a time gone by, that his views are those of another age; we have, in fact, accepted his reputation, we look upon him with the respect that is due to an ancestor.

In the present day, when art, artistic admiration, and art-criticism are made so much an affair of fashion, and even of *cliques*, or, to use a more English word, of "sets," every true art-lover must welcome any effort made in a direction which will tend to widen the somewhat narrow views which,—must it be owned?—we in this country seem destined to take of art. Never should we lose sight of our admiration and emulation of Classic art, the efforts of its masters, their results and teachings; no narrowness of view can possibly result from our study of their beauties, beauties which Winckelmann was, if not the first to appreciate,—the Renaissance artists had long before his days worshipped their Classic predecessors,—the first at least to explain, to reason upon, and endeavour to analyse. We who admire and strive to rival the art of later centuries admire but a dilution of those noble beauties so much more easy to emulate than the original to which in the midst of our ever-shifting fashions the allegiance of the cultivated has never swerved. Something more, therefore, than a mere conventional expression of gratitude is due to the student who again draws before the outer world the lesson of admiration for Classic art, the only true and never deviating standard of all art-teaching, of all art-criticism, of all art-education.

It is, we consider, a fact worthy of notice that the recent publication by a London firm of a translation of Winckelmann's famous "History of Greek Art" comes to us from America. America has been forcing itself rather pertinaciously on the attention of the Old World of late, though in ways generally unconnected, it must be admitted, with the arts. The entrance of our cousins in the field of archæology is noteworthy, for the publication of such a work as Winckelmann's "History of Ancient Art" enters almost solely into that province. The name of the translator, Mr. Lodge, it is true, has been connected with the English translation ever since 1849, when, if we mistake not, the first edition of the work was published by him at Boston, and at London a year later. But until Mr. Lodge undertook the task no English translation of Winckelmann's great work existed, a fact which, when we consider the reputation of the author at the commencement of this century, cannot be said to speak highly in favour of the interest of our public in archæological matters. In France, scarcely had the original edition of the work appeared (1764) than a French translation,—it is true not a very correct one,—was published, and in library catalogues mention will be found of no less than three separate French translations of the work which threw such a new light on the study of the artistic remains of antiquity.

The publication of the "History of Ancient Art" marks, as has been truly said, an epoch in the annals of human thought. A theory of the beauty of Greek art was for the first time satisfactorily laid down,—the development, zenith, and decline of this art for the first time shown in connexion with historical and literary data. With the elements at his disposition, scant as we know them to have been, Winckelmann's history, as a history, is to us now of small use; the whole realm of Greek art since those days has been subjected to a study supplied with data of which Winckelmann was totally ignorant. Phidias and the work of the great school of Ægina who preceded the sculptor of the Parthenaic marble was known but by name to the curator of Cardinal Albani's collection; his eyes had never rested on the glories which now repose in the British Museum; Ægina and its temple treasures still lay buried; the Phigalian marbles were to Winckelmann unknown, the Venus de Milo, the temple of Olympia, the vases that fill our museums, the strange sculptures of Selinonte, the temples of Asia Minor, and, within more recent years, that whole store of information respecting Assyria, Phœnicia, and Egypt, not to mention Cyprus, which we owe to English, German, and French archæological zeal.

Winckelmann and his conjectures have long been left behind, and many an antiquary who has succeeded him; but our debt of gratitude must never be forgotten to the earnest scholar who first analysed in their artistic bearings the monuments of ancient art, who founded the modern science of æsthetic study, so different in its essence to that sickly product of morbid conceit so justly satirised at present in artistic quarters.

Winckelmann's "History of Ancient Art" must not, therefore, be looked upon as a history; his great work may be said to consist rather of a theory of plastic beauty,—the beauty of nature such as the Greeks interpreted it. The task he had undertaken, in the midst of the frivolity of the last century, was one the difficulty of which we of the present generation can little understand. It is true he was assisted largely by the spirit of reaction that had set in; the decorative simplicity of classic life had been singularly revealed to the artistic world by the discovery first of Herculaneum and then of Pompeii. The age was an age of literary antiquaries and patrons; but their services had remained more strictly confined to the enumeration of the classic treasures then in existence. It remained to Winckelmann to see this world of beauty in a new light, to analyse and compare its developments, and, having lingered over its details, to reveal the theory of its charms in language inspired by the noble artistic sentiments of the master-critic, Plato, expressed with the warmth of an enthusiasm which was till his day unknown to the literature of antiquarianism. Winckelmann's views were at once accepted; and if at first in the author's native country he was not immediately successful, he lived to see all opposition overcome. In German literary and artistic annals no name stands higher than that of the industrious struggling schoolmaster who rose to the proud position he occupied at the moment of his tragic death.

The life of Winckelmann has been on many occasions told and re-told. No life is more truly illustrative of the success that ever waits the efforts of well-directed labour. Nothing more clearly proves the heartfelt devotion of the young student to his pursuit than the sacrifice of his Protestant principles to attain his end, which, as he clearly saw, could alone by this means be effected in a court like that of Rome. Once at the goal of his desires,—though he did not reach the Eternal City until he was thirty-eight years of age, 1755 (he was born in 1717),—he threw himself with passion into the study of the productions of the great people with whose literature he had made himself already so familiar; guided by the dictates of a cultured mind, his appreciative and critical powers were singularly developed in this atmosphere in which, as he remarked himself, he should have been born.

Composed of six books, Winckelmann's "History of Ancient Art" embraces the whole field of information possessed by the archæological world of four generations since. The art of the principal nations of antiquity, the Phœnicians, the Egyptians and Persians, the Etruscans, the Greeks, and, finally, the Romans, is passed in review. Art, as the author shows, is but the expression of a need, and as the oldest of these expressions he places sculpture, a view which it can be seen admirably suited the theories he was desirous to expose; sculpture taken as the earliest of the arts, its rise and development are told; Greek mythology discussed; the powerful effect of climate. In his review of Egyptian art it can be understood how meagre was the information at the writer's disposal a century and more since; even more meagre is his sketch of the art of Phœnicia and Persia, anxious as he is to arrive, after reviewing Etruscan art, at his favourite theme, the art of the Greeks. Here we meet with his enthusiasm; all the political and other reasons which gave to the Greeks such supremacy are enumerated by our author with burning enthusiasm,—their freedom, their lovely climate, their physical and mental education, their cultivation of beauty, that strange and mysterious quality, an exact or even general definition of the essentials of which must, as he himself truly remarks, be classed among the truths yet undiscovered. But the expression of this beauty as depicted by the Greeks he seeks and well describes, among the gods and goddesses, learnedly and gracefully explaining the descriptive epithets which the Greeks so skilfully attached to each of their divinities. We next enter into the subtle depths of expression, proportion, and composition; a book is devoted to a lengthy and comprehensive consideration of the details of the human body as treated by the Greek artists; the tale of the decline of Greek art among the Romans closes the work.

It will be seen that Winckelmann's "History of Ancient Art" forms, as has been said of it, a vast encyclopædia of the arts of design, in which were expressed a number of views that to the critics of the last century were essentially novel. It cannot be denied that Winckelmann is not unoften curiously influenced by the spirit of that century, but, when we consider the age in which he lived, we must thank the earnest student who was able boldly to controvert so many erroneous theories current in his day. Winckelmann's "History," in fact, in spite of all that has since been written and discovered, remains essentially a classic.

To his other works scarcely less interest is attached; of his "Monumenti Inediti," published in Italian (Rome, 1767), it may be said to have done even more than his "History" to give him his position in the learned world. But the "Monumenti Inediti" is much less known than the "History"; in its pages, however, he may be said really to have established the fundamental principles of modern criticism for the interpretation of the monuments of classic antiquity,* and to have shown the world that it was not in Roman history, as was the case in his day, that was to be sought the explanation of the artistic relics of classic times, but in Homer and the traditions of Greece.

The impulse given by Winckelmann to antiquarianism was immense; a new spirit was imparted to the investigations henceforth conducted. Since his day how many names are there not which deserve mention in the great field in which he toiled so lastly, before him how few? Montfaucon, that epitome of Benedictine patience, stands out foremost, but he lived a century too soon; as for the Abbé Barthelemy,—the author of that fund of classic information, the *Voyage du Jeune Anacharsis en Grèce*,—he was Winckelmann's contemporary, like the industrious and earnest, though scarcely profound, amateur, the Comte de Caylus. But after Winckelmann the list grows. Piranesi's bold needle did its best to acquaint the world with the art of Greece and Rome; in this century, Thiersch and Meyer are names in Germany hallowed in the annals of archæology, Müller in his Handbook—well translated into English by Leitch — Gerhard and Welcker, Starke, and Kügler, and his still living active continuator, Lübke; in France, the Comte de Clarac, Seroux d'Agincourt, Beulé, Perrot, and a host of others; in England, a list whose names are familiar in our mouths as household words, Professor Cockerell, Layard and Rawlinson, Leake and Falkener, Fellows and Newton, Birch and the veteran Professor Donaldson, and many another. Times have somewhat changed since the day when poor James Millingen could scarcely find in England ten subscribers for his "Ancient Unedited Monuments" (1822), when the doors of the collections he sought to illustrate and make known were pitilessly closed to him, and he was forced abroad, where he received an enthusiastic welcome.

For this change we have, in great part, a debt of gratitude to pay to Winckelmann, by whose

* Vinet, "Bibliographie des Beaux Arts." Paris, 1874.

writings was spread more widely that taste and cultivated admiration for true art that has led in our day to such gigantic creations of but a few generations as the British Museum, the National Gallery, and last, not least, the South Kensington Museum; for Winckelmann's admirers claim for him not merely the credit due to the patient archæologist; biographers such as Mr. Lodge point to his influence for good as "a great philosophic teacher of the beautiful and grand in plastic art." Such, we must all agree, is praise that Winckelmann deserves; indeed, we are daily served with diluted Winckelmann, but that he still remains "the most trustworthy, instructive, and delightful of the masters on art," is a statement which, while it is excusable in the belief of his excellent translator, can scarcely be accepted,—in all due reverence, be it said, to Winckelmann's sacred memory,—without a wholesome reserve by the modern student of æsthetics.*

BUILDER'S MACHINERY AT THE ROYAL AGRICULTURAL SOCIETY'S SHOW, DERBY.

THE Royal Agricultural Society's Show, which was opened in Osmaston Park, Derby, on the 13th inst., contained, as usual, a large collection of engines and machinery. Amongst these were a considerable number designed to meet the especial requirements of the building trades, and whilst according a passing tribute to the very high order of excellence maintained in the agricultural section, we will here confine our attention to those machines which should possess more than a passing interest with our readers.

The largest collection of wood-working machinery was that exhibited by Messrs. Western & Co., Chaddesden Works, Derby. Here was exhibited, probably, the first saw-bench ever driven by electricity; and as this was the commencement of what probably will be in years to come an important factor in the transmission of power for driving machinery, it deserves more than a passing notice. The power was generated by a Siemens dynamo-machine, driven by a belt from an 8-h.p. portable engine. In lieu of the ordinary fast and loose pulleys on the saw-bench, an electric motor was coupled directly on to the saw spindle and connected with the generator —which was some distance off — by wires running underground. The engine being put in motion, enough power was immediately generated to allow the saw, which was 30 in. diameter, to cut with ease ordinary 11-in. deals. The importance of the application of electricity to driving machinery will more readily strike us when we consider the endless uses it may be put to in a large city, such as sawing, printing, winding, pumping, grinding, &c., the power at the same time being generated at a distance, and being distributed to its users through an ordinary copper wire. In districts where water-power is available, and where fuel is dear, an electric motor will be especially valuable; and we do not see any reason why large power should not be generated at a central station in a town, and let out to users at so much per h.p., after the same fashion as gas is sold at per 1,000 ft.

Amongst the other exhibits at this stand was a well-designed centre-feed combined planing, jointing, tonguing, grooving, and moulding machine. The framing of this machine was cast in one piece, and the timber was fed by rollers which were all geared together, thus providing an uniform feed of great power, and preventing any tendency in the wood to slip. The machine was fitted with an adjustable top, a bottom, and two adjustable angling side-cutter blocks, which operate on all four sides of the wood at once. As the wood passes into the machine it is first dressed by the revolving under-cutter, which gives it a level and firm bed on the table, and thus lessens the jar or vibration caused by the operation of the top and side-cutters; the bottom of the board is furnished by a pair of fixed irons, fitted in a movable drawer, which take off a thin shaving. The angling side-cutters in this machine are especially well adapted for working elaborate under-cut mouldings, hand-rails, &c., which can be struck at one passage through the machine; this, and the general design and arrangement of the working parts combine to make it one of the most complete machines of its class.

Another exhibit of Messrs. Western was a combination machine, or "general joiner." This is constructed, with various additions, on the lines of an ordinary rising and falling spindle saw-bench. The saw-spindle is continued and fitted with a planing and moulding block. The wood to be planed is fed on an adjustable table beneath the block, by means of rollers. The table, feed-rollers, and cutter-block are all made adjustable, and can be raised or lowered independently of each other. To the framing of the machine is fitted a vertical spindle and cutter-block for working curved or straight mouldings, sticking sashes, &c. Tenoning, mitreing, and cross-cutting slides are also fitted, and the saw-spindle is arranged for boring. A countershaft, fitted with cone pulleys for changing speeds, is attached to the frame of the bench. This arrangement is compact, but we do not like it, as the centres are too short, and the friction on the belts and bearings is thus much increased; and in practice when sawing, say above 11 in. deep, we have found much heat conveyed from the bearings to the saw, causing it oftentimes to run out of truth; the belts and bearings, too, more rapidly deteriorate.

Amongst the other exhibits at this stand we noticed various band-sawing and shaping machines, and an extremely substantial self-acting feed circular saw-bench, arranged to carry saws up to 48 in. diameter. The bearings of this machine were let in from the top of the table. They can thus be readily examined, or the saw spindle removed, which is an improvement on some older pattern machines of this type.

Messrs. Charles Powis & Co., London, exhibited several engines and a number of wood-working machines. A "general joiner," which was shown in motion, possesses several features of interest. The main framing of the machine was cast in one piece, minimising the vibration as far as possible. The various operations of sawing, planing, or moulding can be carried on together or separately, the main spindle being divided in the centre. The wood is fed through the planing-machine by a powerful arrangement of grooved rollers. The planing end of the cutter-spindle is fitted with a slot mortising apparatus, arranged with horizontal and transverse movements. The lengths of the mortises are gauged by stop-pieces. Tenons are cut in this machine by means of cutters fixed to a pair of revolving discs, the wood being cramped vertically in a slide, and passed between them. The tenons and shoulders are completed at one operation. For grooving purposes, a "drunken" saw is employed.

We also noticed a handy combined circular and band-sawing machine, for steam or hand power. It was arranged also for tenoning by means of four saws, two saws mounted horizontally cutting the tenon, and two saws mounted on adjustable vertical spindles, cutting the shoulders. Other machines were shown here, but they did not possess any special feature of interest.

Mr. R. Taylor, of Bury St. Edmund's, exhibited several of his patented circular saw-guards, which he has designed to protect the sawyer from accidents arising from the wood being thrown off the saw. The guard consists briefly of a steel shield, formed as an arc of a circle. This is suspended from a curved bracket attached to the back of the bench. The shield is held concentric with the saw by a stud, and balanced by a counterpoise. It is made adjustable both vertically and transversely, and is held true over the saw by means of small guide rollers. As the wood to be sawn is pressed against the saw, the shield rises before it, and rests on the top of it till the cut is completed, when the counterpoise brings it back to its original position.

Messrs. Smedley Bros., of Belper, exhibited a well-designed, but roughly-constructed, combined mortar-mill, engine, boiler, and barrow-hoist. These were mounted on a wrought-iron girder-frame, arranged with travelling-wheels, lock, and shafts. The mortar-pan, which was driven from below, was geared directly on to the crank-shaft of the engine, the cylinder being fixed to one of the side standards of the mortar-mill. The driving-pinion was arranged to readily throw in and out of gear, so that the engine might be used for sawing or other purposes. A very useful adjunct, in the shape of a barrow-hoist, was fixed at one end of the girder-frame. This was worked by toothed gearing, and governed by a lever, which also acted as a brake in bringing down the empty barrow. For builders in a moderate way of business a well constructed and arranged plant of the above type should be especially useful. In a future number we may notice the remainder of the exhibits that should interest our readers.

TRANSMISSION OF POWER AT TWOPENCE HALFPENNY PER HORSE-POWER PER MILE FOR PRIME COST OF PLANT.

THE correspondence which has been recently printed in the *Times* between Sir W. Armstrong, Professor Tyndal, and one or two gentlemen of less known names, on the subject of the storage, and what the writers call the electric porterage of electricity, deserves the attention of all persons interested in industrial science. We have very recently (*ante*, p. 757) as well as on certain other occasions, called attention to the subject, but the issues involved are so vast, that our readers will desire to be kept fully up to the last news. It may also be of some service to hint that even men so distinguished in science as those we have named, will do more for the world, and more for their own permanent fame, the more they confine themselves to the duty of simple reporters of facts ascertained, and the less they assume the attitude of the controversialist, and allow themselves to bring forward statements which, however correct, are practically irrelevant to the matter in hand.

Such, for example, is the comparison made by Mr. Reynolds between coal and electricity. We must observe that a somewhat exaggerated view of the results described by Sir W. Thomson is obtained by the use of the unit of the foot-pound, which may be called almost microscopic, as applied to mechanics. The English thermal unit, commonly called "Joule's Equivalent" (from the name of the man of science who arrived at its determination), is 772 foot-pounds, or 0 344 of a foot-ton. This is the quantity of heat which will raise the temperature of a pound of water by a degree of Fahrenheit's thermometer. Theoretically speaking, the perfect and perfectly utilised combustion of half a grain of carbon would develop this quantity of heat, so that Mr. Reynolds is correct in stating that a million of foot-pounds of energy (exactly 1,013,240 foot-pounds) is stored up in an ounce and a half of pure carbon. But that is a mere scientific statement, very slightly connected with the value of the Faure battery. About the highest duty hitherto obtained from coal, and that under those peculiar circumstances which allow of the great economy of the Cornish engines in the simple and regular work of pumping water, is 109 million foot-pounds to 112 pounds of coal, or upwards of 16 ounces of carbon to the million foot-pounds, instead of 1¼ ounces. Thus the comparison instituted by Mr. Reynolds starts from a fundamentally incorrect basis. As to the cost of transmission, it is, in the present case, that not of the transmission of the power, but of the apparatus including the power. That is a matter as to which much change may hereafter be effected. But it does not seem to us, as we before hinted, to come into the front line. For that electric forces will be sent about packed in batteries we regard as extremely improbable. The accumulative power, as we before hinted, is the first thing to master. Next comes the distributive power; and last of all the mode of transmitting the energy from the accumulator to the distributor.

Mr. Reynolds says, by wire ropes and by compressed air or steam, energy may be economically transmitted from ten to twenty miles. Exact data are here desirable. One of the most careful and really practical experiments ever made on the transmission of power by wire ropes was made (and we are glad to have the occasion of calling attention to the new scientific magazine, published at Boston, Mass., in the first number of which the very question of the transmission of power is dealt with by one of our contributors) by no less competent an engineer than Mr. Robert Stephenson, on the Blackwall Railway. "Over the length,"

* For further details of the interesting life and works of Winckelmann the references are numerous. Mr. Lodge's translation contains an excellent biography,—certainly the best that has appeared in English. There is also Heyne's famous "Eulogy"; see also Michaud's "Biographie Universelle"; Gurlitt's "Life" (in German); Hirsching's "German Biographical Dictionary," and Mdme. de Staël in a charming passage in her "Allemagne"; Rossetti's "Sepolchro di Winckelmann in Trieste," &c. It may not be uninteresting to add that, of the few portraits of Winckelmann, one, the work of Angelica Kauffmann, was, until very recently, if it is not at present, in the possession of M. Fuessly, of Zurich; but the most trustworthy portrait is that by Antoine Maron (brother-in-law of Winckelmann's great friend, the painter Raphael Mengs), now at the Weimar ducal palace, and which has, on more than one occasion, been engraved and lithographed.

says the article in question, "of 3¾ miles the friction of the ropes and winding machinery absorbed 251 h.-p. out of 324 h.-p. indicated, so that the force expended on the machinery was 3·4 times as much as that applied to the train." This cannot be called a very economical application of power. As to pneumatic transmission of power, there is a prohibitory limit in the conductivity of metal, and the loss or gain of heat, which is ever telling against the working power. Thus, while we must admit that the transmission of a containing vessel weighing 75 lb., for the transmission of 1,282 Joule's equivalents of heat, is in itself an economical paradox, it by no means follows that the fact that such a transmission has been accomplished, does not afford a new starting-point for the mechanic.

Sir William Thomson has not failed to call attention to the utility of that application of the electric accumulator, which we had previously indicated. He refers to a little battery of seven of the boxes described, as enough to maintain electric light to the extent of 100 candles per six hours. He also refers to the use of the gas-engine for the slow and steady accumulation of power, and, further, to that of a small portion of the steam-power of a sea-going vessel. There must be a vast number of instances in which the means of accumulating the energy of a very small, but constant, power, will produce what the mechanic requires for driving or lighting power, at little or no appreciable cost besides that of the maintenance of the apparatus.

We are, however, still of opinion that the point which, at the present moment, has the most interest for the scientific world, is the verification of the statement made by Sir W. Thomson in his letter of June 9, in which he refers, as we have more than once done, to his evidence before the Select Committee of the House of Commons on electric lighting. It is the prodigious assertion,—we can call it no less, —(if carried out it will be yet more prodigious) that "a copper wire of half an inch diameter would suffice to take 26,250 h.-p. for a distance of 300 English miles, losing so little by the way as to deliver 21,000 h.-p. at that distance. The prime cost of the copper Sir W. Thomson puts at 60,000*l.*, or less than 200*l.* per mile, for conveying this enormous energy. In fact, it comes to something under 3d. per h.-p. per mile,—and that not annual but primary cost. If anything at all approaching to this can be established, the problem of the cost of power must assume a totally different form from that which it at present occupies. The facts are so incredible (we do not say untrue, but we wait for tangible proof) that it seems there must be a mistake somewhere. But the figures stare us in the face. 60,000*l.* for transmitting 21,000 h.-p. for 300 miles. It works out 2·285d. per h.-p. per mile. We trust that we may have as good evidence offered in behalf of this view of conductivity as we now have as to the accumulative power of that form of secondary battery so lucidly described by Mr. Tyndall.

GAS-HEATED HOT-HOUSES AND GREENHOUSES.

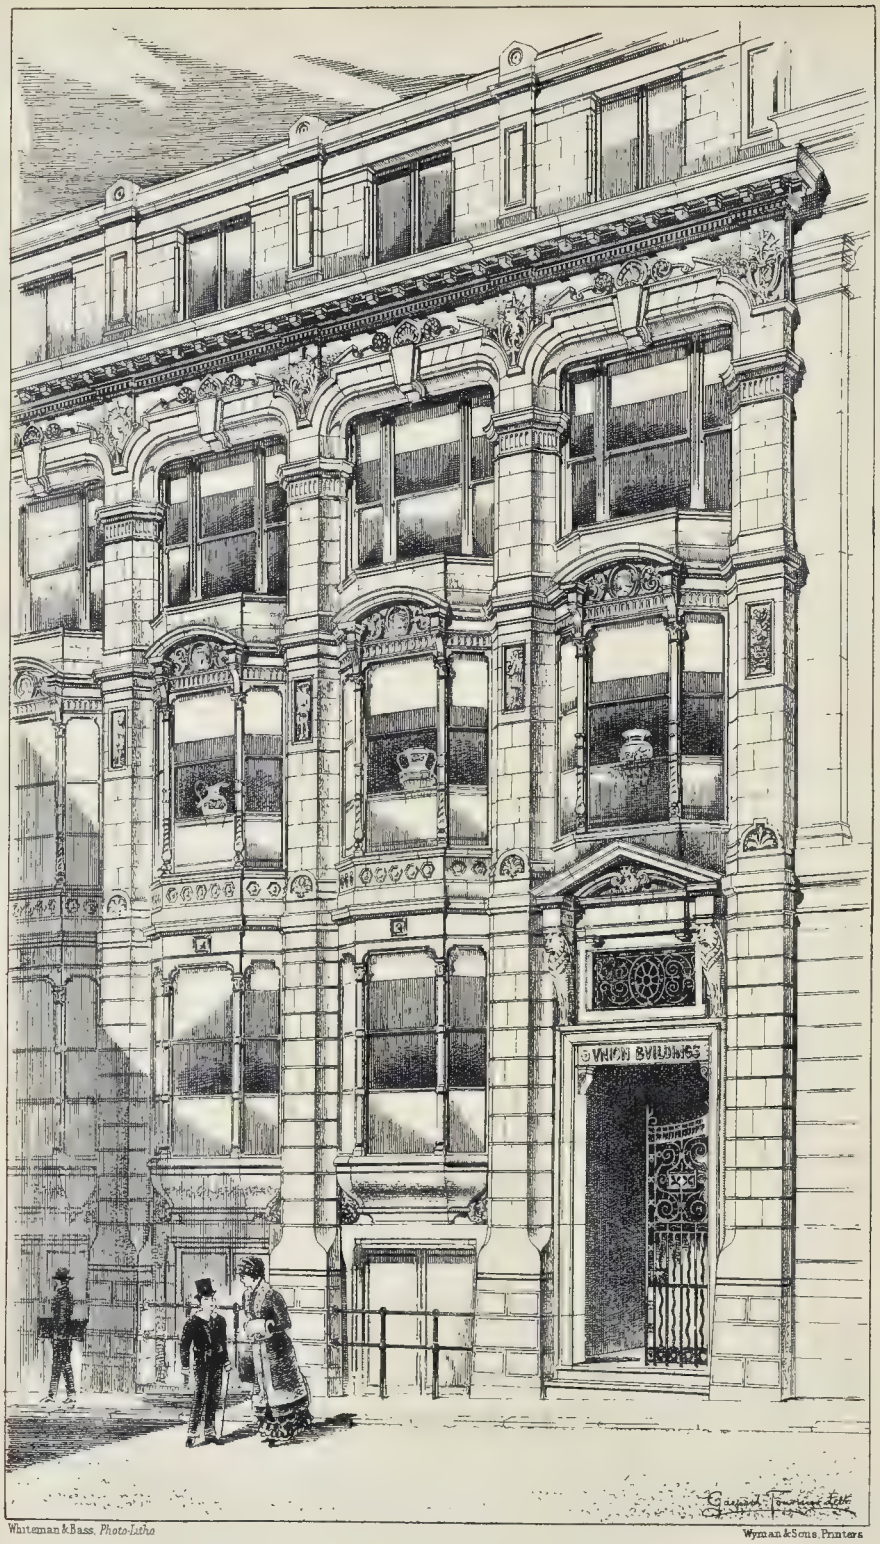
WHEN after numerous trials, failure after failure has followed attempts to apply a principle which seemed to afford great promise, it is not to be wondered at that a popular verdict of "impossible" is recorded, further attempts are abandoned, and the idea is shelved. The heating of hot- and green-houses by gas affords a case in point. Everybody who knows anything about horticulture, cannot fail to be struck with the advantages that gas-heating would present over stove or hot-water heating, if certain defects in the application of gas to this purpose could be surmounted. Firstly, as regards stove-heating, the labour, and, more important, the responsibility and risk of stoking, especially of night stoking, would be avoided. A suitable arrangement of gas-burning having been devised and resolved upon, the entire labour of managing the calorific apparatus would resolve itself into turning on the gas at a proper height, shutting the green- or hot-house door at night, and letting things rest till morning. Secondly, a properly-devised system of gas-burning within the structure to be heated, involving, as it must, to be properly devised, a thorough and perfect ventilation, presents an enormous advantage over any other system which only secures the necessary amount of heat, ventilation being provided for by some extraneous means. It is not a matter of surprise that gas-heating has so generally failed, when we take into consideration the principles violated in this horticultural application. Universally, so far as the writer of this has seen, the mode of utilising gas for the purpose in question, has consisted in the adoption of some variety of gas-stove, yielding a smokeless flame, with no provision whatever for conveying away certain invisible and inevitable products of gas combustion. Not merely the public, but engineers, have yet to learn the potential agency of many invisible things. Beyond steam and air in motion (steam, let it be remembered, is invisible when dry), their notions of the potential agency of things invisible does not commonly go. Thus the gas engineer, when he has provided a smokeless gas-flame, and lighted it under a bath, guarantees his customer against all atmospheric foulness. If his conception of the potency of invisible things had been more profound,—if he had been brought to reflect on the restricted area of bath-rooms and the noxious emanations evolved from a gas-flame, however smokeless, he would have been more chary of his guarantee, not needing the evidence afforded by many recorded cases of asphyxia arising from this cause. About four years ago, the writer of this applied himself to solve the problem of heating a green-house by gas, and succeeded, as anybody else may succeed, by attending to what follows, and putting it into execution. He subsequently, with equal success, applied the same principle to a hot-house. The theoretical proposition was simple enough, viz., to get rid of all combustion products: the permanently gaseous ones by a ventilative current, the condensible ones by downcast tubes perforating the heating and ventilating main at suitable distances. Simple in theory, the solution of this problem was more hard in practice. Not until after many trials, and numerous failures, was success achieved. These shall be specified. The educational value of recorded failures pioneering success, is so much more valuable than a bare record of success, that it becomes a matter of regret they are not more frequently recorded.

The first resolve was to do away with any form of gas-stove. Why not burn the gas at one end of a horizontal main connected at its further end with an upright chimney? The gas-burner adopted was that commonly known as Liebig's, consisting of a drumhead of wire gauze stretched over a cylinder, left open at the bottom, so as to permit a free admixture of atmospheric air. The horizontal heat-distributing and ventilative main first tried, was made up of joined lengths of ordinary 4-in. wrought-iron stove-pipes. Though horizontal in its general aspect, downward bends or droops, almost imperceptible, were established, and at the lowest part of each a small leaden tube was fixed vertically, so as to give exit to all liquid condensed impurity. The contrivance failed ignominiously. Not only did the sulphurous acid product of gas combustion eat through the sheet iron with a rapidity altogether incompatible with every practical need, but for some reason not obvious at first, but plain enough on reflection, the system would not ventilate. On the first day of erection the draught was bad, and it became worse from day to day.

Abandoning the wrought-iron stove-pipe one of cast iron was substituted. It answered better than the first, but from some cause, not at once evident, the ventilation grew worse and worse. Being taken to pieces it was found choked with an accumulation of crystals, the mass containing a certain proportion of ammonia-sulphate and ammonia-sulphite, but still more sulphate of iron, it being well known that sulphurous acid, a first product of gas combustion, rapidly changes into sulphuric acid, and it was this which, by attacking the iron, had yielded the crystals of iron sulphate.

Yielding to this evidence, iron, both wrought and cast, had to be abandoned: equally would it have had to be abandoned for another reason, viz., the too easy heat conductibility of these materials. By accurate thermometric investigation it was discovered that all the heat for distribution had been evolved at a point very short of the upcast pipe or chimney; under which condition there was no draught, as theory indicates there could have been none. Here it may be well to direct attention to the fact that in all cases of heat distribution by tubular radiation provision must be made for conservation of sufficient heat to effect an ascending ventilative column in the upcast shaft or chimney, otherwise ventilation cannot go on.

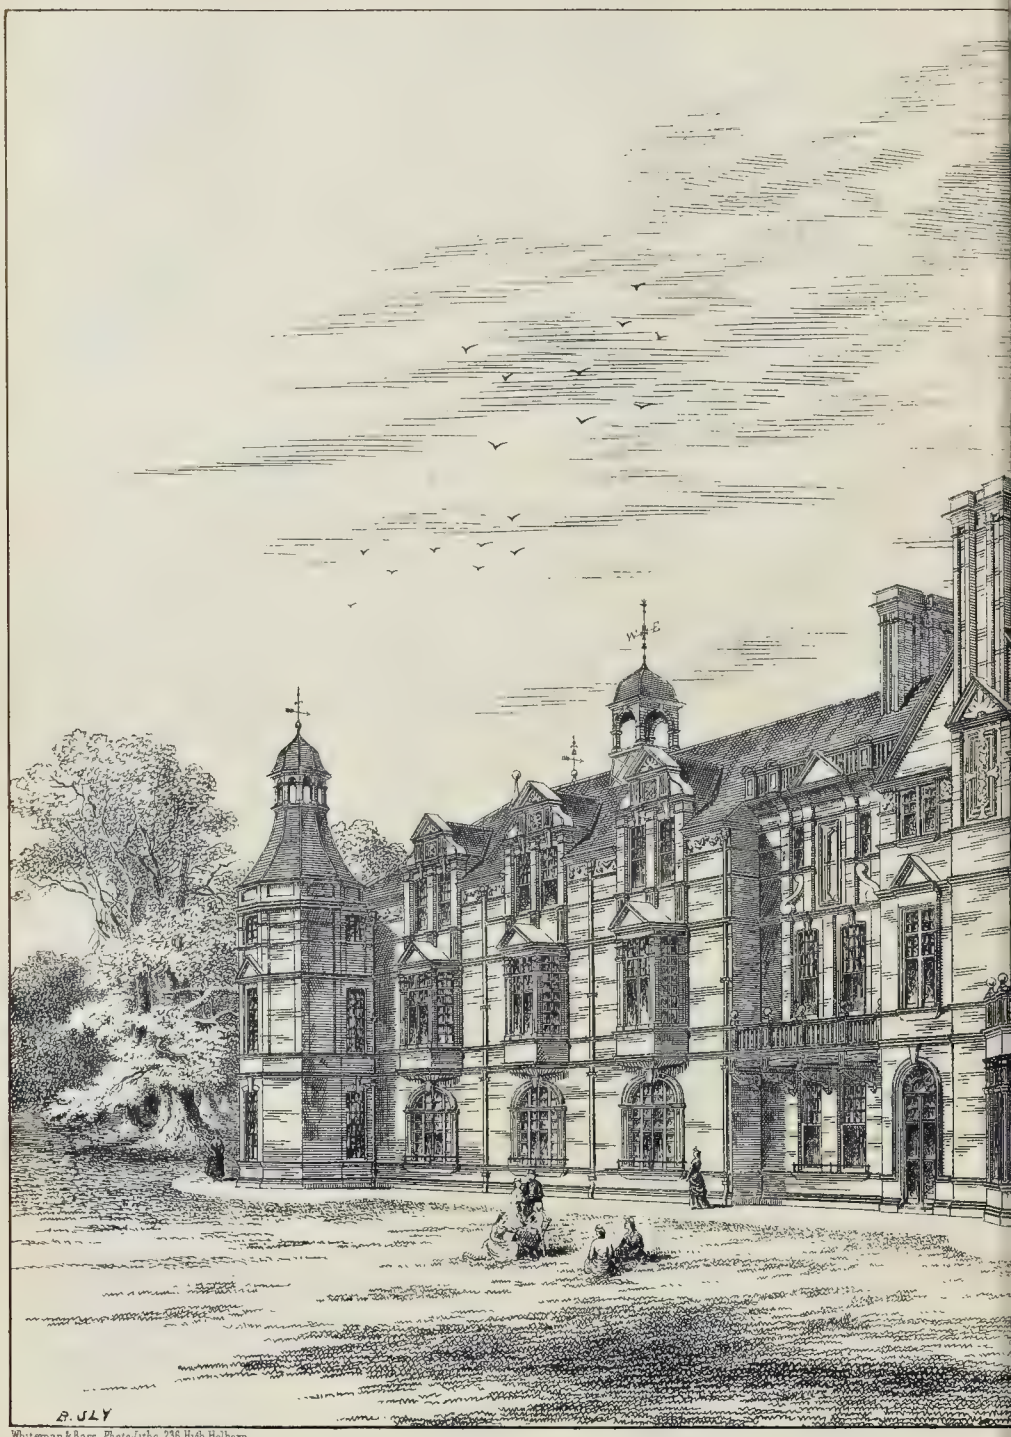
Having abandoned iron, the third venture consisted in substituting earthenware. Common drain-pipe was tried and succeeded; but sufficient evidence has accumulated favourable to abandoning the use of any sort of tube, substituting in its place a rectangular trunk of brick or terra-cotta tiles. Many advantages suggest themselves from the adoption of this device. First, the distribution of heat would be more equal, being radiated from a larger area; secondly, the larger capacity of the rectangular tile-built chamber would nullify any back current which might be momentarily caused by a sudden gust of wind blowing down the chimney.



As already detailed, the result of substituting earthenware drain-pipe for iron was wholly successful; but some little points had to be studied, and the teaching of study applied before entire success was achieved. It was found, for instance, that full reliance could not be placed on a continuity of equable gas-pressure throughout the night, which difficulty was easily solved by using a gas-regulator. Again, many trials and much thermometric observation were brought to bear on the determination of best effective area of chimney gape at the out-of-door extremity of the chimney. This was accomplished by contracting the extremity of the chimney-tube with Roman cement moulded on from day to day, until a satisfactory result had been achieved. A round gape of 1½ in. was found best adapted to insure maximum ventilation with minimum loss of heat, in the case under consideration. Another detail consisted in finding a suitable material for the gas-flare to exhaust the severity of its first shock upon. An earthenware bend at first essayed for this application, was found inapplicable, on account of its repeatedly breaking. A cast-iron bell was ultimately adopted, and with success. The chemical objections to cast iron, when employed throughout the entire system, reduce themselves to a minimum of practical zero in the case described.

The fact should here be stated that the system of gas-heating now described remained under the writer's personal ken for two years, giving full satisfaction. He learns that it does so still, but the locality is many miles away, and for a long time has not been personally visited.

Finally, it will be here well to impress some pertinent facts on the memory of any one who, having perused this statement, may desire to adopt the expedient. To be successful, the underlying principles which dominate the process must not for a moment be lost sight of. It is no case for application of rough measurements or rough-and-ready workmanship. The shape as well as the dimensions of the green- or hot-house must be regarded: also its site, whether sheltered or exposed, whether there are or are not neighbouring erections, the effect of which would be to determine extraneous air-currents. The whole case must be treated as one of arrangement of a piece of chemical apparatus. But once settled, always settled. The practical working conditions of gas-heating for any particular structure having been once determined remain constant to the end.



It was not a little instructive on a sharp frosty day to watch the exit chimney and note the torrents of impure watery vapour continuously discharged. Anybody seeing them would never wonder again, if he had wondered before, at the destruction caused by gas-stoves in green-houses. Equally instructive it was to note the foul acid fluid liberated by the downcast exit-tubes, and to remember that all this would have been dispersed amongst the growing plants by an ordinary gas-engineer having no knowledge of invisible combustion results.

The Sanitary Institute of Great Britain.—The anniversary meeting of this Institute was held on the 14th inst., in the theatre of the Royal Institution, Albemarle-street, Lord Fortescue presiding. There were also present Earl Bathurst, Sir F. Pollock, the Hon. and Rev. Wyatt Edgell, Dr. Alfred Carpenter, Mr. E. Chadwick, C.B., and Dr. Richardson. The chairman presented the prizes of medals and certificates which had been awarded to exhibitors of the best sanitary appliances. Professor Chaumont, F.R.S., then delivered an address upon "Modern Sanitary Science." In a general summary he asserted that the prospects of sanitary progress were, on the whole, encouraging. The dinner of the Institute was held at St. James's Hall Restaurant.

HOSPITAL FOR SICK CHILDREN, BRIGHTON.—*Plan of Ground Floor.*

Wyman & Sons, Printers, G^t Queen S^t

THE HOSPITAL FOR SICK CHILDREN, BRIGHTON.

ON Thursday, the 21st inst., their Royal Highnesses the Prince and Princess of Wales opened the Hospital for Sick Children, which has been erected in Brighton. We give a view of the Hospital and plan of one floor. The building stands in about the centre of an acre and half of ground, which is the freehold property of the trustees of the hospital The site, in the Dyke-road, is surrounded with good property, and is much above the level of the sea. The subsoil is chalk; the materials used are red brick and terra-cotta. The present building consists of a south wing and a central block forming offices of administration; a north wing may afterwards be added. The building contains, on the ground floor, entrance porch, vestibule, corridor leading to staircase and inner hall office, matron's room, board-room, waiting-room, nurses' dining-room, kitchen and offices, staircase and one ward for twenty beds, house-surgeon's room. On the one-pair floor are, operating-room, ten bedrooms, one ward for twenty beds, one special ward for six beds. The two-pair floor includes one bedroom, one ward for twenty beds, and a convalescent ward for fourteen beds, making a total of eighty beds.

The lift is so placed that every floor can be served direct from the kitchen without the possibility of the smell of cooking reaching any part of the building outside the kitchen. The three principal wards are each 59 ft. by 22 ft., and 13 ft. in height, giving a cubical space to each bed of 843 ft. Each ward is warmed by a pedestal stove placed in the centre of the ward, having a fire-grating each way with downward flue, taking the smoke under the floor to a chimney-stack on the outside, common to all the wards. These fires are fed with fresh air from the outside by a flue running through the floor to underside of stove. Fresh air is brought into each ward by eight vertical flues, and the vitiated air is exhausted by means of Robt. Boyle & Son's air-pump ventilator. The w.c.'s and baths are placed in the octagonal towers, which are separated on each floor from the wards by a corridor with open windows on each side and double doors, the door leading immediately from the ward into the corridor must be closed before the w.c. door can be opened. These w.c.'s and bath-rooms are ventilated in the same manner as the wards, but separately. The ward floors are formed with Portland cement concrete and wrought-iron girders, which latter are entirely enveloped by the concrete; to avoid unnecessary weight the concrete is laid in a tubular form. To form principal floor, dovetailed fillets are let in flush with the concrete, upon which is laid a yellow deal floor, and upon this an oak floor grooved and tongued, and nailed angularly, so that no nail-holes are on the surface, thus avoiding any chance of germs or other matters finding a resting-place. The walls of two of the principal wards are lined with very large slabs of Mycene marble, highly polished. This preparation is exceedingly handsome, and almost, if not quite, non-absorptive; thus all danger of retention of germs, malarious gases, or organic matter, is avoided, as well as all painting or distempering and its periodical renewal. Want of funds prevents the adoption of this material to all the wards. To each ward is a ward kitchen and a vestiary. On the outside of the building is placed a galvanised iron tube 18 in. in diameter. This tube is carried above the eaves line and there fitted with a suction ventilator, and at the ground level is a door with open grating for the removal of the contents. This tube communicates with each ward by a small self-closing door, so that all soiled cloths, bandages, &c., may be at once removed from the wards without being carried through the building. Hot and cold water are supplied to all the water-closets, bath-rooms, and ward kitchens.

The staircase is spacious, and well lighted and ventilated, and is, with its landings, corridors, and passages, wholly of Portland stone.

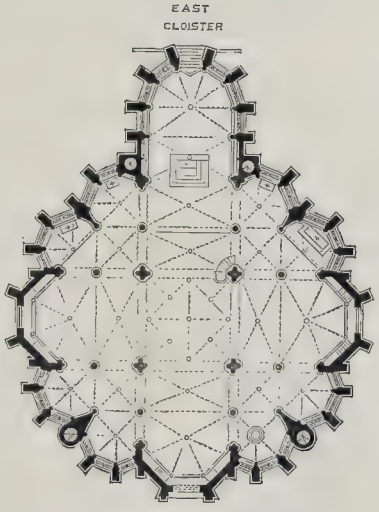
The whole of the soil under the floor of the ground floor is covered by a bed of Portland cement concrete 6 in. thick, and the floor of the ground floor ward is formed thus:—First, a bed of Portland cement concrete 6 in. thick, then a layer of asphalte 1 in. thick, upon which is another bed of concrete 6 in. thick, and finally deal and oak floors in the thicknesses as described above.

The outside walls are built in two thicknesses, leaving a space of 1 in. in the centre, which is filled in with asphalte, and bound together by hoop iron, with the view of preventing internal dampness from external causes.

Internally, there will be no paint, distemper, or wall-papers.

The cost of the present erection will be between 10,000*l.* and 11,000*l.*

Messrs. Lainson & Son are the architects and Messrs. Cheesman & Co. the builders.



UNION CHAMBERS, NORTH JOHN STREET, LIVERPOOL.

THIS recently-erected pile of offices, the subject of our engraving, covers an area of about 130 square yards, and comprises five floors of offices, with a frontage to North John-street of 55 ft., and to Union-court of 24 ft. The depth of the land necessitated the bulk of the light being obtained from the main front, and this has been secured by the introduction of an arrangement of cast-iron oriels, carried upon massive corbels, above the basement-floor windows. Special arrangements have been made for ventilation, without dust or noise from open windows, and ample light is secured on each floor.

The materials used were Stourton stone for the ashlar, and Parhold grey stone for the rusticated base, the front to Union-court being faced with white bricks. Fireproof safes are constructed on each floor of offices, and a separate system of heating by hot water. The cost of the building was about 5,000*l.* The contractors were Messrs. Wells, of Bootle, near Liverpool, and the architect was Mr. David Walker, of Dale-street, Liverpool.

THE LIEBFRAUEN KIRCHE, OR CHURCH OF OUR LADY, AT TREVES.

THE singularly beautiful Church of Our Lady at Treves is another of those architectural puzzles with which Germany abounds: fortunately the date of its erection is known, and, according to Kugler, it was built between the years 1227 and 1243. The plan of this remarkable building is very interesting. As will be seen, the whole composition grows out of the square of the area of the central tower or lantern; from this grow out a nave and transepts of precisely similar size and plan, each consisting of two bays and terminating in three-sided apses. The choir is similar to the nave as far as its first two bays are concerned, but beyond these it is carried two extra bays, and terminates in a magnificent five-sided apse. Instead of aisles, it will be noticed, there are four square compartments occupying the angle-spaces formed by the nave, transepts, and choir. Again, filling in the angles formed by each of these square compartments, and the second bay of each of the transepts and choir, or the second bay of each transept, together with the second bay of the nave, are triangular compartments, each of which forms the base upon which a semi-octagonal apse is described. Kugler* points out the great similarity between the arrangement of this church and that of the choir of St. Yved at Braine, near Soissons.

Now as St. Yved at Braine was consecrated in 1216, and the Liebfrauen Church at Treves commenced in 1227, it is possible that they are the work of the same architect, or that the church at Treves was copied from that at Braine. Upon examining the church at Treves, one is led to the conclusion that its design was the work of two different architects,—the one perhaps a Frenchman or a German working under French art influences, and the other a thorough German. The apse of the choir, the smaller apses and body of the church generally, look like the work of the Frenchman, and are well-developed Gothic, whereas the central tower or lantern and the west doorway, which are evidently no earlier than the rest of the building, and most probably are the latest things about it, are quite Romanesque in style, and Romanesque of a decided German character, they seem, in fact, to have no connexion with the other portions of the building. The windows of this church and the columns under the central tower bear a most remarkable resemblance to those of Westminster Abbey, and the absence of the square abacus, and the fact that the arches are acute and only very slightly "stilted," seem to suggest that the architect of the church may have been an Englishman, especially when taken in combination with the fact that the architect of the clearstory and east end of the Abbey Church of St. Willibrord at Echternach, about ten miles from Treves, was certainly an Englishman.† Notwithstanding this there seems, judging from the plan, to be the greatest probability that the Liebfrauen Church at Treves is a French design.

The cloisters which unite this church with the cathedral are most singular. The windows which light them have regular three-light geometric tracery, but all the arches are round-headed,—even those of the lights. It is quite evident that they are the work of some obstinate German who, while determined lighting in the beauty of French tracery, was determined not to give up the round arch. The experiment, which is also to be seen in a pilgrimage church near Echternach, has proved beyond a doubt that Gothic tracery is ill suited to the round arch, and that windows with circular heads do not admit subdivision so well as Pointed ones.

The internal fittings of the Liebfrauen Church are interesting. The altars, with the exception of the high altar, which is a Modern Gothic erection, are excellent examples of Early German Renaissance; and there is a noble monument of the same style to Archbishop Jacob von Syrk. These probably date from about the year 1525 or 1530; the monument may be a little earlier.

Upon the twelve columns supporting the tower and clearstories of the church are paintings, life-size, of the twelve apostles, executed in the fifteenth century. From one point in the church, just as you enter it, all these can be seen together.

Architects' Benevolent Society. — A special general meeting of contributors to the Architects' Benevolent Society will be held on Tuesday, the 26th inst., at 5.30 p.m., to confirm the new edition of the by-laws, revised at the annual meeting held in March last.

* Handbuch der Kunstgeschichte von Franz Kugler. Stuttgard: Verlag von Ebner & Seubert. 1859.

† This interesting church has a clearstory and east end of pure Early English work, with mouldings and caps of the Salisbury type, triple lancet windows, and "dog-tooth" enrichments. The east end is filled up with a very large triple lancet window. The rest of the church is exceedingly early Romanesque work, except the towers, which probably date from the fifteenth or sixteenth century. This noble church had been used for many years as a china factory, but it has recently been purchased by the town of Echternach and reconverted to its original purpose. Unfortunately, the writer saw it late one evening, and there was no time to sketch it.

ULM CATHEDRAL.

IN June, 1877, the city of Ulm celebrated an event such as happens only rarely in a town of its rank. It was in the time of its growth and power that the Ulmers on the morning of June 30, 1377, laid the foundation-stone of their new parish church, which was to be the largest cathedral in Germany. A year before they had compelled the Emperor Charles IV. to a far from honourable retreat from before their walls, where he had appeared in order to force them to compliance with unjust demands; and but a few weeks prior to the solemnity connected with their church they had received the news of the victory of the United Free Cities at Reutlingen over the son of the Count of Würtemberg and the Swabian nobility. Even after, eleven years later, Count Eberhard the Greiner had asserted his supremacy in Swabia by his victory at Döffingen, Ulm continued to grow in importance. Its territory increased, trade and commerce flourished, and from that prosperous period dates the old German saying, "*Ulmer Geld regiert die Welt*" ("Ulm money governs the world"). And if, according to most recent researches, the statements, still believed in wide circles, respecting the number of population of many German towns in the Middle Ages have been proved in most cases as exaggerated, if, especially, the Ulm of that time hardly ever numbered more than 20,000 inhabitants within its walls, this fact speaks all the more in favour of the energy of that race which was able to entertain such far-reaching plans.

The erection of the cathedral was continued throughout the whole of the fifteenth century, more rapidly or more slowly according as means were abundant or otherwise; the builders being principally Ulrich, Matthäus, and Moriz Ensinger, a family of architects, as well as Hans Kuhn, Matthäus Böblinger, and, finally, Burkhard Engelberger. In the adornment of the interior rivalled with the heads of the at that time flourishing Ulm school of painters,—a Herlen, Zeitblom, Schühlein, Scheffner, — the glass-painter Hans Wild, and the wood-carvers Syrlin, the elder and younger, besides the architect Engelberger, just named. But soon after the beginning of the sixteenth century building operations stopped. The completion of the principal tower had been relinquished already in 1492, when large stones fell out of the tower vaulting. During Engelberger's direction, the tower was underpinned, and, probably, for the sake of greater safety, the two aisles were each divided into two by a series of slender columns. But in the time of the Reformation, and during the period of the Iconoclasts, far more serious and partly irreparable injuries were wrought in the interior. Thus the Dom, the most impressive monument of later Gothic, remained for centuries with the principal tower only half completed, and as well, or rather as badly, as possible, roofed over; without the choir towers, of which only the lower portion, as far as three-fourths the height of the nave, had been executed, and, together with the buttresses and piers, wanting both in security and adornment on the two long sides of the cathedral. Nobody thought of completing the latter during the seventeenth and eighteenth centuries, when bad times, worse government, and narrow views, as they began to prevail during that period in all similar communities, placed great obstacles in the way; the tendency of those troublous times showing itself also in gross neglect of the interior. Yet even in that dilapidated state their cathedral was still an object upon which Ulmers looked with pride, and a theme of admiration for the stranger, as we find in numerous testimonies of the age. Thus, Fritz Nicolai, a writer often unjustly decried, gives an exhaustive and intelligent description and criticism of the cathedral in his "Travels."

It was only in the fourth decade of the present century that the restoration of the Dom was taken seriously in hand, after, in 1817, the atrocity of whitewashing its interior had been finally committed, so that, as a contemporary account approvingly states, "people could no longer see on its walls the old paintings which often foster superstition"! Besides the sense and interest for the building as a work of art, which began to be generally awakened and was kept alive by art-lovers, the knowledge that the cathedral, if steps were not taken to prevent it, would become an utter ruin, helped much to preserve it. In the principal tower the cornice and the porch of the chief portal urgently required repair, and the erection of buttresses and pier-pyramids on both sides of the nave could no longer be postponed, on account of the threatening giving way of the walls of the centre aisle.

Thus, at first slowly, but, as means flowed in more abundantly,—especially after the success of the cathedral building lottery, — more rapidly and steadily, the works proceeded at first under the direction of the architect Mauch, next under the supervision of Thrän and his assistant Seebold, and after their decease under the guidance of the cathedral architect Scheu. An idea may be formed of the extent of the works required when we state that they included,—leaving out the repairs of the principal (west) tower,—the twenty piers and flying buttresses of the nave, the galleries over the two aisles, the eight piers of the choir, and the covered passage of the choir. The completion of the two choir or side towers has been in progress, under Scheu's direction, since 1875. We give in this week's issue a view of the towers on both sides of the choir at the south-eastern and north-eastern end of the nave. These towers will have a height of 281 ft. The southern one, completed in 1878, we believe, is shown in our illustration; that on the north side will be finished shortly. There remains the great task of completing the great western tower. This work, we are assured, together with the interior adornment of the cathedral, is being proceeded with as rapidly as safety will permit.

THE CHICHESTER AND MIDHURST RAILWAY.

IN 1864 Parliamentary powers were obtained for the construction of a continuation of the Mid-Sussex Railway from Midhurst to Chichester, to form there a junction with the main South-coast line of the Brighton Company's system. Midhurst had been before that time, and continued to be until Monday last week, indeed, a terminus of the Brighton Company. The proposed line was about twelve miles in length; the works were let and partially constructed, but were discontinued, and an Act obtained in 1868 for the abandonment of the scheme. It was subsequently revived, and the works were recommenced in 1878, and have now been completed. The line was inspected on the 24th ult., and subsequently certified by Colonel Yolland, for the Board of Trade; it has since been opened for public traffic. The week-day service, for the present, is four trains each way daily between Pulborough and Chichester,—time 1 hr. 10 min.; three between Pulborough and Midhurst,—time 27 min.; and two between Midhurst and Chichester,—time 41 min. The new line, with the Mid-Sussex, forms part of the Brighton Company's system. The South-Western Company has also a station at Midhurst, which it reaches from Petersfield on the west.

There are five stations on the new line. Midhurst, Cocking, Singleton, Lavant, and Chichester. The last is enlarged and adapted for the new traffic; the other stations are new. The old station at Midhurst will be converted into a goods warehouse. The new one is approached by a 40 ft. road from the highway to Chichester. All the station buildings on the line, which are convenient in arrangement and commodious, are from the designs of Mr. Myres, of Abingdon-street, Westminster. They are what may be called Old English in style, in red and white bricks, with stone mullions and dressings. The top story is cased with timber, and covered with panels in cement with carved floral ornaments.

The Midhurst and Singleton stations are nearly alike, and in common with the others are provided with roomy houses for the station-masters, with living-room, kitchen, scullery, pantry, and three good bedrooms. The architect has thoughtfully utilised recesses by fitting them with drawers, cupboards, &c. The whole of the internal woodwork at the stations is of pitch-pine, varnished. The accommodation for business includes a booking-office, 16 ft. square; ticket clerk's office, 15 ft. by 14 ft. 6 in.; general waiting-room, 16 ft. by 15 ft. 6 in.; ladies' waiting-room, 15 ft. 6 in. by 12 ft. 6 in.; refreshment-room, very handsomely fitted up, 18 ft. by 15 ft.; with ample accommodation in lavatories, closets, &c. The ladies' ante-room has a marble table with water-supply for two tip-up basins. The mantelpieces are of slate and marble polished. Lead-fret glazing, with cathedral tinted glass, is freely introduced. The roofs are covered with flat red tiles, and have terra-cotta ridges and finials, with the chimneys effectively grouped. The principal elevation (Midhurst station) is very good,—an open porch for the entrance being a feature. There is a roomy and light subway connecting the platforms. All the stations have covered platforms, very graceful structures, supported on elegant cast-iron columns and brackets. The South-Western Company reaches Midhurst from Petersfield to the west. The Brighton Company has made provision for the South-Western to run in on the north side of their up-platform, which is 600 ft. long. The platform roofs have zinc on their outer, and glass on their inner, slopes. The platforms are laid with Coombe rock metalling, which becomes an excellent smooth hard surface.

The line crosses the South Downs that extend from Lewes and the valley of the Ouse in the east to Salisbury and the Avon in the west. This necessarily involved some rather heavy works, including three tunnels. The first is Cocking Hill, and is 738 yards long; the summit of the hill is 92 ft. above the tunnel. The second tunnel is under Drove Park, the finely-wooded and beautiful seat of Lord Leconfield. This tunnel is 740 yards long, the ground over it varying from 2 ft. to 60 ft. The thin crust was tunnelled rather than passed in cutting, that the beautiful scenery might not be marred, or the difficulties and dangers of fox-hunting increased. This is one of the favourite covers and hunting-fields of West Sussex. The third tunnel is under West Dean Park, the property of Mr. F. Bower; it is 441 yards long, and in the centre at nearly equal distance between Midhurst and Chichester. This tunnel has, at the highest, 112 ft. of earth, &c., over it. In addition to these works there is a tunnel-bridge 49 yards long, at a point near Mid-Lavant, where the line passes under the Chichester high road. The tunnels are egg-shaped, and of five-ring brickwork. They are handsomely faced at the entrances with red and white brickwork, a 4 ft. pilaster on each side crowned with an entablature, a panelled parapet, and caps and copes of Portland stone. The most important of the station works are those that have been executed at Singleton. This will be the nearest station for Goodwood race-course, about two miles distant. The large accommodation that will be required during the race-week, and the natural formation of the ground, necessitated heavy works. To economise the space, and provide the necessary accommodation, a concrete retaining wall was built 400 yards long, 25 ft. high, with a batter of 1½ in. to the foot. It is above 6 ft. thick at the base, and 3 ft. at the top. The station buildings and accommodation here are similar to those at Midhurst; but in addition there is 500 ft. of dock-accommodation for carriages. The platforms aggregate 400 yards in length, and are 25 ft. wide. There are three-fourths of a mile of sidings, or accommodation for fourteen trains of twenty carriages each. There is a goods-shed at the end of the station, 60 ft. long by 30 ft. wide, with five hydraulics, a 46 ft. turntable for engines, a line of rails through the goods-shed, goods office, &c. There is a pumping-house at the other end of the station. The approach is by a 60 ft. road from the Chichester highway, with a separate road to the goods-station. There is ample platform and waiting-room accommodation for each sex upon both platforms. A large lavatory for gentlemen has been provided in an extra building. There is a refreshment-room upon each platform.

The gradients on the line are comparatively easy, the stiffest being 1 in 60 for a short distance; there are occasional breaks of lengths on the level. The summit, about half a mile beyond Cocking tunnel from Midhurst, is 287 ft. above Chichester, and 203 ft. above Midhurst.

There are ten over, and twenty-four under, bridges on the line. Eight of these are wrought-iron girders; five with cast-iron girders; eighteen are brick-arch bridges; two for the crossing of the highway, and one ornamental bridge for Mr. Bower's accommodation. The under-bridges are built for a single line, and are 14 ft. between the parapets, except one near Cocking, and three near Singleton, that are built for a double line, and are 25 ft. between the parapets, which are 4 ft. 6 in. high, with red or blue brick coping. All the over-bridges are built for a double line, and one north of Singleton Station for three lines of rails. All the brick bridges are single arch, with wing-walls, newels, pilasters, and stone caps.

The chalk slopes in cutting are one-half to 1, in gravel, &c., the slopes are 1½ to 1. The bases of cuttings at formation-level were 19 ft. for single and 30 ft. for double line. The sleepers for the permanent way, 9 ft. long, 10 in. by 5 in. scantling, are laid right to the 21 ft. rail. The rails are 84 lb. to the yard, and are of steel at all curves.

There is a fair proportion of the line on embankments, from which charming views are obtained. Between Midhurst and Cocking, for instance, there is an embankment two miles long. Cocking station is high, and close to the South Downs, and very extensive views of hill and dale, wood and water, can be commanded from that and other points; some of them taking in the Isle of Wight, Hayling Island, and other places on the coast. Near Cocking the Crypt ravine is crossed by a short embankment 56 ft. high. Between Drove-tunnel and Singleton station glimpses are obtained of the grand stand and the hill at Goodwood. The station platforms at Singleton are on an embankment 20 ft. high, from which also good views are commanded, amongst others over a part of West Dean Park, the seat of F. Bower, esq. The grounds are extensive, and laid out with great taste. West Dean House, a large mansion, is an interesting curiosity in building. The front is built entirely of flints dressed with sharp arrises. The ornamental bridge, built by the company, to connect Mr. Bower's severed property, is opposite his gates, and is built of red brick, with white brick facings, Portland stone caps, and ornamental panels of flint-work in the pilasters and parapets. At Mid-Lavant the line passes close to the churchyard where the celebrated author, divine, and controversialist, Dean Hook, of Chichester, formerly Vicar of Leeds, was buried. About a mile from Lavant, Chichester Cathedral and spire are sighted, and at the end of another mile Fishbourne signal-box is reached, and the line curves round and runs alongside of the South-Coast line for about three-fourths of a mile, to form a junction with it at Chichester station. A new goods station has been built here 145 ft. long and 35 ft. wide.

At Cocking, where the line intersects Lord Egmont's property, special works were constructed, to enable his lordship to quarry chalk from both sides of the line, and to convey it to the station.

A good deal of useful material was obtained from the line. Abundance of excellent sharp sand was taken out. From a cutting at Lavant the whole of the top-ballast for the line was taken, as also for the concrete wall at Singleton. For this the gravel was not only well-screened, but thoroughly washed in the stream. It was made up with blue lias lime. The bricks for the tunnels and bridges were made by the contractor from clay got from the line, and from a field belonging to the railway company. They were all made by machinery in the contractor's own brickfields.

The principal landowners on the line are the Earl of Egmont, Lord Leconfield, Mr. F. Bower, the Hon. and Rev. A. Legge, the Bishop of Chichester, and the Hon. Vernon Harcourt; these eminent personages may be expected to put a good deal of traffic on the line in valuable timber, and other woodland and agricultural produce. Great quantities of copse wood and willows are produced in the district for conversion into baskets, cask-hoops, wattles, &c. A great deal of charcoal is also made in the district.

The line was laid out by Mr. F. D. Banister, engineer-in-chief of the Brighton Company. Mr. Horace J. Mannering has seen the works carried out as resident engineer, with Mr. J. Phillimore as clerk of the works. Mr. T. Oliver, of Horsham, has been the contractor; the arrangement of the points, signals, and signal-boxes has been intrusted to Messrs. Saxby & Farmer the well-known signal engineers.

Art Loan Exhibition at Windsor.—On Monday last H.R.H. the Princess Beatrice opened an Art Loan Exhibition at the Albert Institute, Windsor. The exhibition includes works by Rubens, Michelangelo, Titian, Canaletti, Gainsborough, E. M. Ward, Gustave Doré, Greuze, E. W. Cooke, R.A., D. Maclise, R.A., Van Beest, Sir Joshua Reynolds, Romney, H. Vernet, Constable, Sidney Cooper, Cattermole, and others. Her Majesty contributes a series of water-colours by Paul Sandby, chiefly of views of Windsor Castle and precincts, date 1750 to 1780, and several works by the same artist are contributed by other residents in the town.

KESWICK.

EXCEPTING only one word, Bunyan's description is applicable, for it is in a "most pleasant, mountainous country, beautified with woods, vineyards, fruits of all sorts, flowers also, with springs and fountains, very delectable to behold." It is out of the course of great trades, and hence there are not the impulses to progress other places know, but it is in the path of the pleasure-seeker, and it has known a little of that steady growth which has set in, since by the growth of communication and the distribution of wealth, Lakeland became the holiday haunt of Britain. Compare Keswick of the past with that of the present, the town before its railway era with that we know, and it will be seen that it has gone "down the ringing grooves of change." A little more than twoscore years ago, when the Derwentwater estates had just been sold by the Greenwich Hospital Commissioners, Keswick was composed of one long and stony street; it had a manufactory of coarse woollen cloths and a smaller one for the fabrication of finer textures. Upon the Greta there was a forge, and tools, spades, and similar articles were made,—lead was worked and pencils made, and there distinctive industry ended. The population of the place was 2,159; the Derwentwater had pleasant seats and residences on its bank. There were seven or eight pencil-makers; two inns only were named, but there were eighteen taverns and beersellers. A coach did duty for passenger traffic, two mail gigs conveyed letters and parcels, and three carriers were then unabolished. In the list of residents, occurs that of "Robert Southey, esq., LL.D. (poet laureate), Greata Hall," lighting up the undistinguished ruck of "nobility, gentry, and clergy." In a few years, Southey has passed into his rest with most of his contemporaries, and something has been done by the extension of the railway system towards making a city of what was his solitude, and the Keswick of the present is widely different from that of the past.

One of the boasts of Keswick now is its local organ, and that guardian of the interests and chronicler of the doings of the town can tabulate for the capital of Lakeland half a dozen churches, chapels, and meeting-rooms; can record at length the doings of its local bodies and the result or accompaniment of their labours in a very diminutive death-rate, as well as place upon its page the changes in the trade of the town; but probably in nothing is the change better exemplified than in the fact that the town is now brought within a limited distance, so far as it is measured by facility and quickness, of communication from most of the great centres of population in the kingdom. In that extension of railway facilities, not only has the town of Keswick been benefited, and the district of which it forms a part, but the benefit has been reciprocal, and one of the great pleasure spots of the kingdom has been brought within the reach of the many, instead of the few. The result has been to swell the demand in Keswick for that accommodation which has become necessary, and to give to the town the element of growth it had not previously known. It is not that in population it has known the progression of a Chicago, but in the intervening years there has been a steady accretion of population, and the town has struck out its little shoots and additional streets, and is still sending them out, and names them after its great poet, after its hills, and after other of the things it prides itself on. And, coupled with this, it has added to the neat mansions that are on the shores of Derwentwater; and it has increased its hotel accommodation by the addition of stately structures that compare well with the older inns of the past. Its industries have not increased: pencils are still one of the special manufactures, and lead is mined, at and near it; but agriculture around it, and the preparation for, and the reception of visitors, as well as their comfort and their conveyance, support the little town of beauty. It runs its seven coaches daily to Windermere; its hotels are very many in proportion to its population, but they are pleasant places of rest and refreshment,—solid as well as liquid,—instead of the bars and gas, glitter and gin, that dominate in some of our great cities. In Keswick the advantages of association are known; for roads and for recreation, for the cheap waterworks of the Local Board, for literary associations and scientific societies the townsmen unite in an endeavour to make their town and district more enjoyable to themselves, and more attractive to visitors. Thus in that beautiful spot of England, which Cumberland and Westmoreland enshrine, Keswick is the acknowledged capital; and of the days of a man's life, few are more pleasant than in that "land of streams," which poets have sung of, which painters have depicted, and which presents, long after the visit, its hills and dales, its streams and lakes, to the memory. Keswick has grown comparatively great: the growth of its hotels, its lodging-houses, its coach accommodation, the fleet of boats that press the dark bosom of Derwentwater, and the villas that stretch along the side of the lakeward roads, all point to that growth. In the past, hotels such as that of Lodore would have been impracticable, for the guests could not have been conveyed, but now rapid and cheap communication seems likely to make a city in the solitude of some of the lakes. And with the careful sanitation which Keswick shows, with its abundant supply of purest water, with a Local Board that fulfils the duties attached to it well, there should be in the future a continuation of that growth which the past has known. The benefit of these retreats from the world which is "too much with us," and that from the occurrence of that holiday, which may be called, in Dickens's words, a "happy, unsubstantial idle time," cannot be overrated, and it is well for us that "the unconquered arm" of steam has enabled the beauties of the Lake district to be placed before all classes. Our health resorts need especial care, that they may be fit for their use; that they shall be cities of health; and that all the conditions that are essential to health restoration and to the enjoyment of the cases in time shall be presented by them. It is because it has appreciated this, and because it endeavours to carry it into practice that the pleasant little town of Keswick has grown of late from the smaller secluded Paradise Southey knew. And if it may have lost one or two of the charms which to some natures seclusion gives, it has far more than counterbalanced these, and that especially in the benefit that it gives to the swollen streams of visitors who make it head-quarters for tours from lonely Wastdale to fair Bassenthwaite.

WIND PRESSURE AND WIND MOVEMENT.

THE subject of wind pressure has been recently discussed by the American Society of Civil Engineers. It may be in the remembrance of our readers that in some of our own remarks on this important subject, especially with reference to the great estuary bridges of Scotland, we spoke of the large allowance for this element of stress that was made by American engineers. The Institution, however, is not satisfied with the actual state of scientific information on the subject, and has recommended further experiments. One or two very remarkable facts were brought out in the discussion, with reference to which, however, it may be questioned whether in an island of the size of Great Britain it is reasonably probable that a tornado could attain the fury with which blasts of that nature have been known to sweep over large districts in America, and also in India.

One of the remarks of the American engineers is to the effect that the speed of the wind is at times much greater at 100 ft. or 200 ft. above the ground than it is on the ground itself. We think it is undeniable that this may, at all events at times, be the truth. We have estimated the movement of clouds at thirty-five miles an hour, when the movement of wind shown by an anemometer was very considerably less. It is in accordance with the properties of a fluid like the air that it should *drag* over the ground, running over itself, and flowing at a much greater speed at a distance from the cause of frictional resistance. It follows that an allowance of from 30 to 50 per square foot, which is common in America for bridges, ought to be considerably increased for a lofty viaduct. Near the eastern end of the Great Bridge at St. Louis it is stated that a tornado actually lifted a locomotive from the rails, without damage to the way, and deposited it in a ditch by the side of the line.

The Marshfield tornado was a well-known storm in the United States, the track of which was followed by Mr. Shaler Smith for forty-six miles. The track was about 1,800 ft. in width, and the tornado developed a lifting force of 58 lb. per square foot. A small house, with 13-in. brick walls, was levelled to

the ground by this tornado, and a piano standing in it was lifted by the wind and conveyed for a distance of 270 ft. In the Saint Charles tornado a lifting power of 85 lb. per square foot was developed, but the track was not more than 60 ft. wide. It passed through the centre span of the St. Charles Bridge, and took up a barrel of tar which stood there, which it burst to pieces. In the route of this tornado the walls of the houses that were overthrown usually fell outwards, showing that a vacuum followed the burst of the storm, and that the expansion of the air within the house was the cause of destruction.

It must be remembered that the normal atmospheric pressure is not far short of a ton per square foot (at 15 lb. to the square inch it is 2,160 lb. to the square foot). Thus the reaction, or rush of the atmosphere to fill a vacuum caused by a tornado, is likely to have a far more rapid action, and thus to be more destructive, than the direct force of the storm itself. Some remarkable instances of this have been mentioned by us in our recent papers on lighthouses, and we cited a case where cast-iron doors, at a considerable height above the sea, were burst open outwards by the vacuum caused by the fall of a heavy wave around the tower. Whirlwinds and waterspouts at sea develop phenomena of a similar nature to tornadoes by land, and may be more conveniently studied. The writer of these lines on one occasion counted as many as fifteen water-spouts in one day over the Bay of Naples. From the top of Hermon, in northern Syria, the sandy waste to the east of Jordan may be seen to be traversed by whirling columns of sand,—the water-spouts of the desert. The whole subject is one of deep interest, for the physicist as well as for the engineer, and is one which we shall rejoice to find treated with an exhaustive care befitting its importance.

AN OLD-FASHIONED SUMMER.

SUMMER is upon us, with its old-fashioned intensity. Without any attempt to discuss the thorny question of the displacement of Saints' days, and other calendar dates, first by the slow changes of sidereal movement, and then by the acts of Popes and of Parliaments in the reformation of the calendar, we may venture to record the occurrence of a St. Swithin's day without rain,—if not without cloud. And the difficulty as to the adjustment of the calendar does not interfere with the fact that the weather which prevails when the sun has advanced some two-thirds through the sign Cancer, is generally steady and durable, for a month or more, whether it be wet or dry.

With a dry July we are enjoying a hot one. As a rule, July is the hottest month of the year. But then, also as a rule, it is one of the wettest. Mr. Symons, who may be said to have succeeded St. Swithin of Mediæval times, and Aquarius, of the Classic era, as president of the weather, tells us that "July, August, and October appear to be the wettest months at most stations, but that in mountainous districts December, January, and February are far wetter than any others. In fact, the seasons appear almost reversed." In 1880, 5·11 in., or rather more than a sixth of the whole rainfall of the year, fell in July, during which month rain fell on twenty-three days. The mean temperature of the dry-bulb thermometer was 61·7° Fahr. The maximum heat was 75·5°, the minimum 48° Fahr. This temperature of last year was almost exactly the mean temperature of July for the past twenty years, which is given by Mr. Plant, of Moseley, near Birmingham, as 61·6° Fahr. In eleven out of the last twenty summers, July was the hottest month. At the close of the present July we shall probably find the average of 61·6° to have been considerably exceeded. Nor is the heat local alone. It seems to be general in its distribution. In the United States sunstroke has made numerous victims. At Florence the thermometer has reached 99° Fahr. in the shade. On the 15th of July the temperature stood in the Strand at 95° Fahr. in the shade at one p.m, and later in the afternoon at 98° in the shade, and 123° in the sun. At five p.m. the shade temperature was 90° Fahr.

Glorious as the weather is for the corn-crops, it is not unattended by much personal suffering, especially for the residents in the metropolis and other large centres of population. Nor is it a question of comfort or discomfort alone. The death-rate becomes unusually high. The journals teem with complaints as to London smells. The intolerable character of the tepid water which is drawn from so many neglected cisterns leads to new essays to improve the water-supply of the metropolis. We are not undervaluing the need of reform in this respect; but we cannot too loudly call attention to the domestic cisterns. We would recommend every householder to see that the cistern or cisterns from which he draws any fœtid water are thoroughly and effectually cleaned out, so that at least we may not make use of water more impure than that which flows from the mains of the companies.

It is refreshing, in such weather, to hear what Liverpool is doing to provide for the wants of her 550,000 inhabitants as to water. Within the last ten years she has added 60,000 souls to her population; and Rivington Pike no longer suffices for her mains. At a distance of sixty miles from the head spring of Severn, the river Vyrawy, after a course of thirty-five miles, falls in on the left bank. It is a mountain stream, formed by the union of a multitude of branches, and drains about 350 square miles of mountainous and little-peopled country. The waters of this stream and its affluents will be impounded at Llanwddyn by a vast dam of 1,255 ft. in length and 140 ft. in extreme height, raised across the valley. A lake of some five miles long, with an area of over 1,100 acres, will thus be formed, and a triple row of pipes of 60 inches diameter will be laid to convey the water to Liverpool, at the distance of seventy miles. The supply is calculated at 52,000,000 gallons a day.

As to London, pending the re-introduction of any measures into Parliament for the regulation of the water supply, attention is now being invited to the application of Dr. Clark's process for softening the water already supplied. The water of the several metropolitan companies (in the year 1877) varied from 12·9° to 13·8° of hardness on Clark's scale, with the exception of the Kent water, which has a hardness of 19·1°. This hardness, however, is reduced by boiling to from 3·1° to 3·6° in the case of seven companies, and to 5·6° in the case of the Kent company. A committee has now been appointed to collect and spread information on the subject of the application of Clark's process to the softening of the metropolitan water, and the Chelsea company, which made experiments on the subject in 1851, are to be applied to, to renew their experiments. The degrees of hardness are equivalent to the number of grains of bi-carbonate or sulphate of lime contained in a gallon (or 70,000 grains) of water. At or below 6° of hardness, water is regarded as soft. Above that, it is called hard. There is no doubt that the process may have the result of removing all the chalk in excess of 1½ grains per gallon from the water treated. The practical difficulties of the operation, however, are considerable. The pipes conveying the water treated become choked with a mass of minute crystals of carbonate of lime. And it was reported in 1851, by a chemical commission appointed to consider the value of the process of lime purification, that even when combined with filtration it was insufficient to remove the yellow tinge of Thames water during flood, nor did it appear to abate an objectionable taste of vegetable matter which the water also possessed at such times (see "Water and Water-Supply," p. 47). As the water of all the other companies, not even excepting the Kent, becomes soft by boiling, and as for culinary and washing purposes water is usually boiled, it hardly seems to us that it is by way of introducing the lime process that the most practical reforms are to be made in the London water-supply. If the committee were to turn their attention to a house-to-house inspection of cisterns, we think that much more utility might follow their labours.

Meantime the demand for water steadily increases. The population of London (vol. xl., p. 719) is now 3,814,571. This requires, according to the present rate of allowance, an annual daily supply of 122 million gallons, and a daily supply during such a month as the present of more than 140 millions of gallons. In July, 1859, the daily flow of the river, for the average of the month, was not more than 422 millions of gallons, so that London wants already to drink a third of the summer flow of the river. What does an abstraction of this magnitude mean, unless it be accompanied by those precautions as to purity of which we talk so much and accomplish so little? Let any tourist look at the water of the river Wey, as it passes under Guildford Bridge. Let him reflect that it is on its way to its junction with the Thames, above the intakes of the Metropolitan Water Companies. What reflections he will then make we do not now offer to guess. But a thermometer at from 80° to 90° indicates a state of the atmosphere in which impure water becomes something more than disagreeable, and tends to the conclusion that a death-rate of 20·1 is, after all, much lower than might easily have been caused.

"A DAY IN THE COUNTRY."

"Help me to give the poor children of my parish a day in the country."—*Ecclesiastical Circular.*

THE benevolent clergyman who discovered the meaning of what his agricultural parishioner intended by "nailing a mossifer," and has made known to the world that to "nail a mossifer" means to inhale the atmosphere, could, if he would allow his benevolence to extend its influence a little farther, tell us many a story of the happy healthful results of "a day in the country."

At this season of the year every post carries urgent appeals to the charitable on behalf of the children of our terribly overcrowded neighbourhoods, calling upon us all to help in affording the poor little ones the means of enjoying the pure air, which, it has been said, is alone to be met at a distance not less than ten miles from London. It is true that the metropolis is every year becoming a very much greener place than it has been in the memory of old Londoners, and really at some portions it seems again to be returning to the appearance that antiquaries tell us Cheapside and the City presented in the seventeenth century, when the fig-tree and the vine were conspicuous in the heart of London. The last space lately opened on the Thames Embankment, beneath the shadow of the Victoria Tower, and fitly named Victoria Gardens, promises to be a great boon to crowded Westminster. But even these open spaces, much advantage as they afford to the little ones, and which are, indeed, sufficient to remove those absurdly exaggerated statements that horrify one occasionally by the information that thousands of young people are brought up in London who have never seen a green tree or a blade of grass, are yet very insufficient to afford the delight, the health, or the influence on the imagination of a lovely luxurious meadow, with its splendour of buttercups, or, later on in the year, its rosy-toned clover, or the mystery of the tree-shaded woods, the variety and the beauty that are associated with a hedge-row.

A little of this enjoyment and advantage may be obtained even by a day in the country, a day passed within ten miles of London, but it is a question whether very great good to the health of a child is gained by merely one overcrowded day of enjoyment passed in the country; let there by all means be as many days as we can spare at this or any season of the year, and let us do our best to aid that more liberal, more sensible project which we are happy to see has already taken a very definite form, of allowing our overcrowded districts to send their little ones for at least a week into the country. Then we should see the gain to happiness and morality secured by that indirect influence on the health, which acts through the mind from the recollection of happy hours and agreeable memories, memories of the novelty of first impressions during hours and days of monotonous routine.

A day in the country is scarcely sufficiently distant from the heart of London to secure the pure air which we all sigh for; a day with its heat and excitement compressed into a few hours does not suffice for the good that we all of us desire that the mass should experience, but a week, a whole week in the country, what health, what memories, what good may not result from such an experience. How many are there of us who cannot look back to our own recollections of a week in the country, the memory of which will never fail us as long as we live? How often have we, whose lives are passed in London, not rejoiced to see our little ones return happier, more beautiful than when they left a week before, more fitted, because happier and stronger, for the wear and tear of daily life. But this happy result we must confess has generally been in the return from the seaside, where the invigorating influence of the air, of bathing, is even greater than that of the surrounding greenery afforded by an inland stay in the country.

Mr. Mark Fisher has been elected a member of the Institute of Painters in Water-colours.

THE CAMBERWELL NEW FIRE BRIGADE BUILDINGS.

THE Camberwell Fire Brigade Station in Peckham-road has just been rebuilt, by direction of the Metropolitan Board of Works. The station, until recently, was limited to the ground-floor for the engines and offices, with two or three apartments above. The building has now been carried up to a height of about 50 ft., and consists of three lofty floors, containing large and convenient apartments for the officers and men belonging to the brigade. The building, which has a handsome elevation to Peckham-road, is faced with white Suffolk brick, and stone and red brick dressings, and is relieved by ornamental bands in terra-cotta. The elevation is surmounted by a lofty gable, with bold stone coping. At the rear of the building there is a tower and look-out, rising to a height of 80 ft., and commanding an extensive view around the metropolis, from which a fire raging in any district may be easily seen.

The building has been erected from the designs of the Metropolitan Board's Architect. Mr. Taylor, of Brixton-road, was the contractor.

GREAT COST OF THE LONDON AND NORTH-WESTERN COMPANY'S GOODS STATIONS.

MR. GEORGE FINLAY, general manager of the London and North-Western Railway, who was one of the principal witnesses examined last week, before the select committee of the House of Commons now sitting on railway rates and fares, incidentally stated some important statistical facts as to the cost of the goods stations belonging to the company in London and several of the large towns. He said that in providing goods station accommodation the North-Western Company had spent 2,300,000*l.* in London; 812,000*l.* in Manchester; 280,000*l.* in Birmingham; and 1,913,000*l.* in Liverpool; and that these sums were altogether exclusive of the immense amounts which the company had expended in passenger stations in those towns. The sum actually expended in providing goods stations in Liverpool was twice as much as was required originally to construct the Manchester and Liverpool Railway. He added that in addition to the expenditure which the company had incurred in the construction of these large stations, they had also to provide an enormous mass of sidings for the reception of train loads. At Willesden they had provided twenty miles of sidings, and at Edge Hill, Liverpool, thirty miles; and they had in course of construction at the latter place another eight miles.

THE NEW FORTH BRIDGE PROJECT.

IT has at length been decided that the construction of the great bridge across the Forth shall be proceeded with, notwithstanding that a Bill authorising the abandonment of this stupendous undertaking, has already passed the House of Commons. At a special meeting of the shareholders of the Forth Bridge Company held last week, the chairman, Sir James Falshaw, presiding, it was resolved to withdraw the Bill from the House of Lords, and to proceed with the erection of the bridge. At this meeting the chairman of the company observed that the Bill for the abandonment of the scheme had been opposed by the three southern railway companies —the Great Northern, the North-Eastern, and the Midland—who were not satisfied that the bridge could not be built, thinking that the construction of the bridge was practicable. He added that they had submitted it to the engineers of their respective lines, namely, for the Midland, Mr. Barlow; for the Great Northern, Mr. John Fowler; and for the North-Eastern, Mr. T. E. Harrison. These gentlemen had examined the ground, and looked at all the circumstances, and the result generally was that the bridge, as designed by Mr. John Fowler, was the one that had been looked upon with the greatest favour by the companies. He then further stated that the directors had come to the conclusion that it was best for themselves and the shareholders to withdraw the abandonment Bill, and that to meet the expense of constructing the bridge, which was estimated at 1,370,000*l.*, the four railway companies—the Great Northern, the North-Eastern, the Midland, and the North British—had agreed to guarantee two millions sterling, and the shareholders who had already entered on the scheme were to be guaranteed 4 per cent. The guarantee is apportioned as follows:—North British, 30 per cent of the whole; Great Northern and North-Eastern jointly, 32½ per cent.; and the Midland, 37½ per cent. It was unanimously resolved to withdraw the abandonment Bill, and the construction of the bridge is to be proceeded with according to Mr. Fowler's design, which, the chairman said, had been approved by Mr. Barlow and by Mr. Harrison, who had both expressed their opinions to him that it was a thoroughly substantial bridge, not a suspension bridge at all, but what was called a continuous girder bridge. The chairman added that he knew Mr. Fowler to be about the ablest man they had in the kingdom, and if any man could build a bridge like that, which should be permanent, which should endure as long as the railways lasted, Mr. Fowler was the man to do it.

FROM FOREIGN AND AMERICAN SERIALS.

ITALY.

Giornale dei Lavori Pubblici (Rome, July 13). The late serious accidents to workmen, especially in Rome, have directed public attention in Italy to their protection from the carelessness or niggardliness of their employers; and an article in this number gives a sketch of the measure introduced by the Government for this purpose, and which is expected to pass the Italian Parliament. Its provisions are very stringent. The responsibility of all accidents in buildings, mines, quarries, or workshops, is laid upon the contractor or proprietor; and it is for him to exonerate himself by proving that the misfortune was due solely to the negligence of the person injured, or to unavoidable causes. If he proves contributory negligence, the fact is to be considered in fixing the indemnity; but otherwise, the workmen injured are to be compensated as follows:—For temporary disablement, full wages until recovery; for total and permanent disablement, three years' full wages; in case of death, one year's full wages to childless widow; half wages until the children are grown up, to widow with children; two-thirds to widow with children, where there are also dependent parents; three years' full wages to childless widow and dependent parents. These sums may be transferred to benefit societies, and recovered by them. When an indemnity is decreed, it is to be paid at once, even when an appeal is pending. Workmen cannot contract themselves out of the provisions of this Act. Although this law (if passed) will be severe on contractors and employers generally, it is considered that their past negligence has justified strong measures; and the *Giornale* points out that they can protect themselves by means of accident insurance, which is a new thing in Italy, having only been introduced within a few months by a single company.

AMERICA.

The Scientific American (July 2).—This number contains details of the Storer Garbage-cremating Furnace for the consumption of town refuse. It consists of a brick-lined cylinder about 60 ft. long and 6 ft. in diameter, having an incline of about ½ in. to the foot, which is caused to rotate by a wheel and screw. At the feed end of the cylinder is a fireplace, in which the pulverised fuel used in the operation is ignited. At the further end is a combustion-chamber, in which the gases are decomposed, previous to their escaping by the smoke-stack. The garbage, passing through this cylinder, is exposed to the flame generated in the fireplace; and is either dried for use as manure, or burnt to ashes, according to the length of the time which it occupies in passing through the cylinder. This is regulated by the speed at which the cylinder revolves. It is calculated that a furnace of this size will consume 350 loads of garbage in one day.

The Scientific American (New York, July 9.—An interesting note on the history, composition, and preparation of water-glass is to be found in this paper.——A flagstone, 25 ft. by 15 ft., has been cut at Waterville, N.Y., for which $5,000 has been offered, delivered in New York. As, however, it is too large to be carried by railway or canal, the question of the means how to remove it, seems to be a problem not easy of solution.——The roofing-slate industry in America, which ten years ago was not of sufficient importance to be mentioned in the census returns, now employs 3,000 men and $8,000,000 capital. Last year 600,000 squares (of 100 ft.) were produced, of which more than half were raised in Pennsylvania. The blue-black slates, from Maine, are the most durable, and are said to rival best Welsh. Green, purple, red, and variegated slates are also found; but the colour does not last.

COMPETITION CARDS.

THE competitive designs for Christmas and New Year cards now on view at the Egyptian Hall, sent in by 879 competitors, and some 3,000 in number, include some very excellent work,—better, indeed, than any we have before seen applied in this direction. The judges, Messrs. G. D. Leslie, R.A., Briton Riviere, R.A., and W. Hagelberg, of Berlin, have made their award, we are told, but it will not be published until Monday next. Twenty of the sets are to receive 1,000*l.* between them, and fifty other sets are to be selected at 10*l.* per set. Judging from advertisements from dealers in Christmas cards, and the money paid by some of the firms who do not advertise, the trade in them must be enormous.

SALE OF THE LATE SIR CHARLES REED'S MANSION AND GROUNDS, TOTTENHAM.

A NUMEROUS company was attracted to the Auction Mart, on Tuesday, by the announcement of the sale by Messrs. Debenham, Tewson, Farmer, & Bridgewater, of "Earlsmead," Tottenham, the freehold residence of the late Sir Charles Reed, chairman of the London School Board. The property was described as being situate at Page-green, Tottenham, and immediately adjacent to the Seven Sisters and South Tottenham Railway Stations. The mansion itself was stated to be a richly-decorated residence, and there are adjoining cottages and grounds, the whole occupying an area of about four acres. It was added that the property had four frontages, which materially increased its value as a building estate. The biddings commenced with an offer of 4,000*l.*, upon which an advance of 500*l.* was immediately made, and by further advances the property was quickly brought up to 6,500*l.*, when the biddings slackened, on which the auctioneer announced that the property was now altogether in the hands of the company, and would be sold at the price offered if there was no advance, although he considered that 9,000*l.* or 10,000*l.* was a low estimate of its value. By further advances the property was brought up to 7,450*l.*, at which sum it was sold to a syndicate, with the intention of its being laid out as a building estate.

SEWERS AND SEWERAGE.

Burgess Hill (*Sussex*).—The Local Board of Burgess Hill have appointed Messrs. Bailey-Denton & Co., their engineers, to carry out a scheme of sewerage and sewage disposal for their district.

Watford (*Herts*).—The urban authority of the above town have called in Messrs. Bailey-Denton & Co. to modify the present arrangements on their sewage farm by the introduction of intermittent filtration in combination with wide irrigation.

Portland Cement.—Messrs. Matheson & Grant, in their Trade Report, say:—"The factories in the London district, from their local advantages, still govern this trade, and prices have tended to increase slightly with the summer demand. The cost of carriage bears so high a proportion to the price of English cement in foreign countries that attempts to manufacture it abroad are constantly being made. In Russia, whither large quantities are shipped, local factories are being encouraged by a considerable addition to the duty on imported cement. This is likely to limit the export from London to the Baltic and Black Sea, and may tend also to deteriorate the quality of engineering structures in Russia, the evil results from the use of untried cement not being easily detected for some time. The present price for export ranges from 7*s.* 6*d.* to 8*s.* 3*d.* per 400 lb. cask."

THE LATE DEAN OF WESTMINSTER.

QUIETLY, painlessly, almost suddenly, full of labour, if not of years, regretted by troops of friends, one of the foremost men of the England of the nineteenth century has sunk under the great summer heat of July, 1881. Ripe scholar, graceful writer, effective if not altogether ready speaker, courtly gentleman, kind-hearted man, Arthur Penrhyn Stanley, Dean of Westminster, has filled a large space among the notabilities of the day. His memoirs and memorials fill a large space in the journalistic literature of the past week. It is not as such that we have to speak of him, and that not because we could not find much to say, but because space cannot be afforded in our columns for an adequate treatment of any one of the varied phases of an active and honoured life. Still less does it become us to enter into any of those fierce contentions which are not yet extinct as to many of the acts and views of Dean Stanley. There are those among us, as good and as able as he was, who regard many of the chief problems of human life from an altogether opposite stand-point from that taken by him; and whose chief regrets will be that the views which they contest should have been supported by a man adorned by so many noble qualities, or rather, that the golden thread which they hold to run through the whole web of their convictions should not have bound into more perfect symmetry the admitted virtues of the man they so often opposed. With all that we have here nothing to do; nor have we space to speak of a topic more germane to our pages,—the thorough human charity of the man; his love and care for the dwellers in squalor and misery around the Gothic walls of his deanery; his large sympathy with whatever is human. If his remains have not "a tomb of orphans' tears wept on them," yet the memory of himself and of Lady Augusta will long live in something more divine than marble or than brass.

But a word is due from us to the memory, not of the man, but of the Dean. Dr. Stanley's name will be identified with the Abbey not less notably than that of any preceding dean or abbot of Westminster. Haunters from childhood of the sacred precincts, there are those among us who claim an hereditary interest in the Church of St. Peter at Westminster, partly *atavis editi regibus*, as humble members of the "founder's kin," partly as representatives of the artistic hands that have lent some of its chief adornments to the pile. To such, and to all who love and venerate this corner-stone of English history, the memory of Dean Stanley will be dear. What has been done under his presidency for the re-establishment of a solemn and reverent service in the choir is not special to Westminster. St. Paul's owes at least an equal debt of gratitude to its present Dean. Hardly a hamlet so remote but that it feels the influence of the wave of greater earnestness, and therefore deeper reverence, that is flowing over almost every form of religious worship in England.

Our chief concern, however, is with the debt due to the late Dean as the conservator, the historian, and the very voice, of the holiest of our holy places. Under his impulse Westminster first became, since the expulsion of the monks, a place of public worship in the broadest sense of the word,—a place whither the reverent student of sacred antiquity might turn aside from the whirl of City life, and hold commune with the memories of the mighty dead, unvexed by the demand of "twopence for the verger." The care of the monuments, the apposition of printed cards giving the most needed information, the evidence in every corner of the building of the desire that the Minister should tell its own story to every attentive inquirer, will, we hope, not be allowed to sink to rest in the grave of Dean Stanley. And as to the actual material structure, how much of its present order is due to him? Well do we remember being present on the occasion,—and giving some account of it in our columns,—when Dr. Stanley appealed, not in vain, for public support for the restoration of the Chapter-house. The changed state of the whole of that portion of the precincts: Chapter-house, cloisters, chapels formerly hidden; stones on which the inroads of the mouldering teeth of Time have been arrested by the art of the chemist; bit-by-bit repairs of portal and of tracery, on the very lines of the artists of the time of Henry III.,—all these were the work of Dean Stanley. To state what he did for the Abbey and the precincts would be to write a full, and not one of the least important, chapters in the history of the fane in which our monarchs are crowned. It is a chapter which we should gladly see written. In it, if worthily accomplished, will be inscribed, in an architectural sense, the best epitaph of Dean Arthur Stanley.

PATENT RECORD.*

APPLICATIONS FOR LETTERS PATENT.

2,881. A. H. Elliott, New York, U.S.A. Crushing stone, &c., and making blocks for paving, building, &c., therefrom. July 2, 1881.

2,883. H. P. Dunnill, Ironbridge. Decorating tiles, &c. July 2, 1881.

2,898. F. Grinnell, Providence, U.S.A. Extinguishing fires in buildings. July 2, 1881.

2,904. W. Moore, Lyminge. Composition for polishing articles of furniture, &c. July 4, 1881.

2,920. W. W. Hewitt, Swanscombe. Apparatus for conveying cement, &c., from place to place. July 4, 1881.

2,921. H. J. Haddan, Strand. Roads and pavements. (Com. by J. Salvat, Morceux, France.) July 4, 1881.

2,935. J. Louis, Minories. Supporting, &c., persons outside buildings. July 5, 1881.

2,945. F. D. Harding, Hampstead. Applying decorations to doors, &c. July 5, 1881.

2,969. E. Aldous, Peckham. Ventilating purposes. July 7, 1881.

2,975. E. Johnson, St. Helens. Manufacture of bricks, tiles, &c. July 7, 1881.

2,978. H. J. Haddan, Strand. Chimney caps. (Com. by A. Picherean, Cailly, France. July 7, 1881.)

NOTICES TO PROCEED

have been given by the following applicants, on the dates named.

July 5, 1881.

861. W. Morgan-Brown, Southampton-buildings. Hanging doors and blinds. (Com. by E. Prescott, Hampton Falls, U.S.A.) March 1, 1881.

906. G. L. Shorland, Manchester. Stoves and fire-places. March 3, 1881.

1,044. R. Douglass and J. Douglass, Coventry. Apparatus for the cure of smoky chimneys, &c. March 11, 1881.

1,101. M. E. Dearnaly, Mirfield. Bricks, and the method of binding them together in building. March 14, 1881.

1,210. J. Bernard, Great Winchester-street. Baths, &c. March 19, 1881.

July 8, 1881.

934. F. Hyatt, Kensington. Core or skeleton metals, and applying the same to the construction of buildings, &c. March 4, 1881.

1,143. W. R. Comings, Upper Thames-street. Door locks. March 16, 1881.

1,290. W. R. Comings, Upper Thames-street. Bells, knockers, &c. March, 23, 1881.

ABRIDGMENTS OF SPECIFICATIONS

Published during the Week ending July 9, 1881.

4,861. C. G. Pfander, Queen Victoria-street. Apparatus for filtering water.

A cylindrical case is formed within which are a number of radial partitions. The compartments thus formed are charged with the filtering material, and the water enters the bottom of the first compartment and rises through it till it flows over the partition into the second, through which it descends, then ascends the third, and descends again through the fourth, and so on, when it is drawn off. Nov. 23, 1880. Price 6d.

4,972. A. C. Engert, Bromley-by-Bow. Fire-grates.

A chamber is formed at the back of the grate, open in front, but closed on all the other sides, in which the fuel is heated before it is drawn forward to be burnt in the grate. The smoke, therefore, from burning the fuel is greatly decreased. Nov. 29, 1880. Price 6d.

4,986. W. Morris, F. P. Preston, J. E. Prestige, and E. J. Preston, Deptford. Apparatus for regulating and controlling the flow of water, &c.

The cistern is fitted with a syphon for flushing purposes, and the long leg of the syphon is connected to a cylinder, fitted with a piston operated by a handle. The inlet from the syphon is at one end, and the outlet to the closet at the other end of the cylinder. By moving the piston, a vacuum is created which immediately fills the syphon and causes a flush. Several different arrangements are shown. Nov. 30, 1880. Price 6d.

4,992. J. Harsant, Vauxhall Bridge-road. Sink trap.

A bell-shaped chamber has a curtain dipping into the water contained therein, and a ventilating pipe is fitted communicating with the space enclosed by the curtain and with the open air. (*Pro. pro.*) Nov. 30, 1880. Price 2d.

4,996. J. Walker, Lower Clapton. Cocks and taps.

Glands are formed at the top and bottom of the cock, and the plug is constructed with three tapers, one in the water-way as usual, another from the water-way towards the top for the gland, and the third from the waterway towards the bottom for the lower gland. Dec. 1, 1880. Price 6d.

5,057. J. F. Hoyne, Water-lane. Apparatus for regulating and controlling the passage of atmospheric air through outlets and inlets.

A tube is filled with coke, asbestos, pumice-stone, &c., through the interstices of which air can freely pass, while at the same time a strong current is broken up. This tube is made to fit the aperture in which it is to be placed. Dec. 4, 1880. Price 2d.

5,102. N. Talard, Paris. Pipe-joints.

Lateral lugs are fixed on one end of the pipes, to which are pivoted links, the free ends of which have eccentrics that can be turned by levers. On the other end of the pipes are jaws corresponding to the lugs. The ends of the pipes being placed together with the lugs opposite the jaws, and the eccentrics being turned, the two ends are brought tightly together. Dec. 7, 1880. Price 6d.

* Compiled by Hart & Co., Patent Agents, 28, New Bridge-street, E.C.

CHARITABLE AND PAROCHIAL ESTABLISHMENTS.

SIR,—I am sorry to find, by the notice you have done me the honour to give your readers of my work on "Charitable and Parochial Establishments," that I do not appear to have clearly stated what it was in my plans of the St. Marylebone Infirm Wards that received the commendation of Dr. Bridges, the Local Government Board Inspector, and consequently you do him the injustice of supposing that he "has something to learn on the subject of planning and arranging such buildings." Permit me, therefore, to say that no one (not excepting yourself) has more persistently decried than he has, the principle, as a principle, of placing the beds of a ward down the side walls instead of, as usual, against the outer walls. In the case, however, of the St. Marylebone Infirm Wards, to which Dr. Bridges' commendation was confined, the problem to be solved was the erection of a three-storied building, to contain 250 infirm inmates, upon a site 104 ft. by 64 ft., with frontages on two sides only, and if it could have been shown that it was possible under such conditions to have planned these wards so that all the beds should be placed down the outside walls, as is generally the case with all modern hospital wards, then undoubtedly he would have condemned the result of my labours instead of extolling it.

The building in question was erected for the reception of infirm and aged paupers,—a class of persons occupying their wards almost continuously day and night, and the majority of them, though suffering from no acute disease, and able to get up and be dressed during some part at least of the daytime, yet too weakly to often move a great distance from their beds, and consequently it was desirable that each ward should be so planned, as to form a combined sitting and bedroom. The usual mode of planning such wards on a site so contracted as that at St. Marylebone would have been to place the beds in four rows, two being next the outer walls, and two separated by a low partition in the centres of the wards. By this plan it would not have been possible to place the beds at a sufficient distance apart to allow the windows, excepting upon rare occasions, to be open while the inmates were lying in bed; but by the plan adopted by me, the patients can all be lying in bed without any inconvenience arising from the current of air passing through the wards when the opposite windows are open, and thus the maximum amount of cross ventilation is secured. Dr. Bridges, as I understand it, agrees in this view, and so, also, will you, Sir, I venture to hope.

H. SAXON SNELL.

"Evans's."—We are asked to mention that the purchase of Evans's, Covent-garden, by the Falstaff Club is now complete. The premises have been transferred, and the alterations for the purposes of the club are in progress. An old and familiar resort which, in its day, was a very popular place of amusement, has ceased to exist. In the upper part of the house, moreover, the Institute of Architects held its first meetings.

AT A LECTURE BY MR. HELLYER.

At the repetition given of one of the recent lectures on plumbing, the chair was taken by Colonel Thorneycroft, who thus introduced the lecturer:—It may appear strange to you that a chairman should have been brought you so far as I have been, from the Midland counties, but I presume it is because I have given so much attention to this subject and have spent so much money upon it, and it delights me greatly that in London you are becoming aware of the danger of ill-ventilated and badly-drained houses. I made many experiments and spent much money in my own house, and if the National Health Society will accept my remarks and the plans I made of those experiments, I shall be glad to give them, for their republishing, for the benefit of their society. This lecture is on sewage and ventilation, and the Society of Arts have kindly given the use of this splendid room; but what a pity it is that so clever and learned an association should have such a dreadfully ill-ventilated room. It is unfit to lecture in, filled with splendid pictures, but no fresh air; in fact, the air is foul and offensive, because there is no ventilation equal to the wants. There are a few things that it requires: a gas-engine to force in fresh air, and another to suck out the foul air; the gas apparatus at the top does not half do it this hot night. This room reminds me of the besom-maker who turned his donkey out on the common where there was no pasture; and his friends remonstrating with him, he replied, "Well, if there is nothing to eat there is a delightful prospect;" and I say of this room, "If there is no fresh air there are splendid pictures." We want fresh air here for the benefit of listeners. What is the use of splendid pictures if you are panting for fresh air? It is kind of the Society to lend the room, and we are grateful, but they should for their own benefit get it better ventilated, and then more would listen with pleasure and not injure their health. I am delighted that our friends in London are alive to the interest of the subject of this lecture on drainage and ventilation. I have, with the assistance of others at Wolverhampton, started a Sanitary Protection Association, but we get on very slowly. It has been started eight months, and we have got about eighteen customers. These are fully satisfied; but what a struggle to get so few; remember there are 70,000 inhabitants in the town. How long shall we be in getting the town healthy at this rate? Well, I have got some friends to join me in trying to impress on the Government the desirability of having compulsory inspection to all houses, on the same plan as is now adopted with education: all are compelled to comply. Well, health should go with good education, but it wont go without compulsion, so I hope London will join with the country in pressing this point. It can be done at such a trifling cost. You are fortunate in getting such a gentleman as Mr. Hellyer to lecture on this subject, because I believe he understands this subject as well as any man in London, and the more you all know of the subject the safer for you all. Let me, in conclusion, press on you all to have your houses inspected by the sanitary engineer, and after that try them yourself, as the proof of the pudding is in the eating. Open the drain-pipe just a few yards from the house, then let sulphur be burnt in the pipes, and blow the smoke up the pipes with bellows, and if any one smells the sulphur in any part of the house the owner may be sure that he is living in sewer gas, which is deadly and dangerous. I could talk to you for a long time on the subject, it is so important, but I must now content myself by introducing to you the lecturer.

THE NEW ART GALLERY FOR BIRMINGHAM.

THE Mayor of Birmingham (Mr. Richard Chamberlain), on Tuesday last laid the inscription-stone of the new buildings in Congreve-street and Edmund-street, which are to form the Corporation Art Gallery and the offices of the Gas Department. Since the commencement of the alteration in the structure of the Free Libraries and Midland Institute buildings, the town has been without any public art-gallery, the collection of pictures and objects of art formerly contained in the gallery in Ratcliff-place having been temporarily exhibited at Aston Hall, while additions purchased by the Public Picture Gallery Fund trustees have had to be comparatively hidden from general view in the committee rooms at the council house. It will be remembered that last year Messrs. George & Richard Tangye made an offer of 5,000*l.* for the purchase of additional objects of art if the Corporation would at once take measures to provide an art gallery commensurate to the wants of the town, and 5,000*l.* more if a similar sum were raised by public subscription. It was felt that so generous an offer ought not to be disregarded, and while there was every ground to believe that the public would readily second Messrs. Tangye's benefaction by a large subscription, there was a difficulty to overcome in providing from the corporate funds a suitable building, the means of the Free Libraries Committee, limited to a rate of a penny in the pound, being almost wholly required for the libraries alone. A solution, however, was fortunately suggested, which it is hoped will prove satisfactory. The Gas Department, which had hitherto carried on their business at the premises of the Staffordshire Gaslight Company in the Old-square, were in need of better accommodation, and an arrangement was come to whereby the Corporation placed at their disposal the unoccupied land adjoining the Council House upon the condition that the Gas Committee in erecting their offices should reserve the upper story for a Museum and Art Gallery, the expense of this upper story being taken into account in fixing the ground-rent (if any) to be paid by the committee. This arrangement met with approval, and steps were taken to carry it into effect. The Gas Committee were instructed to have plans prepared, and to at once proceed with the construction of the foundations. As the new buildings are to form a continuation of the Council House, the preparation of designs was referred to the architect of that structure, Mr. Yeoville Thomason. The buildings are to cover the site bounded by Congreve-street, Edmund-street, and Eden-place. Upon the ground floor and lower ground floor will be commodious offices for the use of the Gas Department, which will communicate on the ground-floor with the Council House at each end of the structure. The whole of the first floor will be appropriated to the Art Galleries, for which a main entrance will be provided from Edmund-street. There will be six galleries, communicating with each other by archway entrances, the largest gallery measuring 80 ft. by 43 ft. The area of wall space, calculated, to a height of 16 ft. above the floor will amount to 12,298 superficial feet, exclusive of one large gallery, 98 ft. by 53 ft., which is to be set apart for an industrial museum. The external elevation of the building will form generally a continuation of the Council House, the front to Congreve-street being varied by a portico in two stories the full height of the building, and emphasising the entrance to the Art Galleries. The elevation at its junction with Edmund-street will be terminated by a clock-tower. The elevation to Edmund-street will be in harmony with the other elevations of the Council House, but in much plainer style, the principal portion having a receding centre, with projections at each end, finished with curved pediments. The entrances to the gas offices in Edmund-street will be sufficiently marked to produce variety in the design. The elevation to Eden-place will be similar to the present, except that the upper windows are omitted, and moulded panels worked instead. The site was prepared and everything got ready for the stone-laying by Messrs. Barker & Sons, of Handsworth. The clerk of works, Mr. Trevena, and the foreman, Mr. J. Morton. The contract for the erection of the superstructure has not yet been entered into.

UTILISATION OF SAWDUST.

SIR,—Seeing in the *Builder* lately that a suggestion had been carried out for the utilisation of sawdust, I beg to suggest that it should be used to a much greater extent than it is, for the deadening of sound, in the erection of houses, particularly those which are likely to be let off in apartments, and blocks of buildings which are fitted up as dwellings for artisans and others. Considering that about two millions of people in London are living in apartments or dwellings, it is strange that their comfort has not been studied to a greater degree than it has, in prevention of sound by filling up the spaces between the floor-joists with sawdust. It would be well if owners of property knew more of the fearful annoyance which neighbours are to each other, and unavoidably so too, to a great extent, simply through the sounds being heard so distinctly by those underneath them. The children are half-imprisoned, the mothers are harassed beyond measure, and neighbours are at variance, through the noises of each other being heard so distinctly.

C. H. B.

Books.

German, Flemish, and Dutch Painting. By H. J. WILMOT BURTON, M.A., and E. J. POYNTER, R.A. Sampson Low & Co.: London, 1881.

THIS is one of the series of illustrated text-books on art which are being published under the editorship of Mr. Poynter. The title-page, we observe, assigns him joint authorship in the book, but what is his precise share in it there is nothing to show. The name of the other author, who, we suppose, is the actual writer of the greater part of the book, is new to us.

The book appears to us to be one of the best we have seen of the series. It is more satisfactory than the volume on Classic and Italian painting, partly, perhaps, because the subject is more manageable and more easily grasped in a single small volume. The "German School," which is the section of the subject treated first, is traced from its origin, that is to say, there is an opening chapter devoted to "the origin of the German School," but it serves to indicate that the information available upon that part of the history of German art is very restricted. The short chapter on "the precursors of Albert Dürer," however, contains some interesting matter in relation to painters whose very names are hardly known except to professed art students; and the writer does not forget to consider the art in relation to the changes in the times, and to note the spirit of advance, of looking forward rather than back, which the Reformation brought into art as into every other department of human study. Albert Dürer and his followers, including the "little masters" (the Behams and others), are well and rather fully treated of; Holbein and his successors follow, and then the history of the decadence and revival of German art follows. It may be a question whether the latter deserved the name of a revival or not, since it consisted in persistently looking back to the art of a past day and trying to reproduce it. The movement was the counterpart, in fact, of the pre-Raffaellite movement in England, but it did not show the strength and sinew which the painters of that school in England certainly did show, in spite of their perversities of precept and practice. The German pre-Raffaellite movement was more closely connected with a religious movement, ecclesiastical in its tendency, than was the case with us. Art was to be a sort of worship, and worship was to go hand-in-hand with art. When Mendelssohn was in Rome, the younger generation of this school of revivalists were active both in painting and in religious rites, and he describes their devotion to the musical service of the church, which he admired; "one capital fellow of a painter standing next to another, and all shouting like demons," the last phrase referring to their delivery of the Gregorian chants. But all that does not make painting. The German revivalists, says the author, endeavoured to adapt to the mystic style of Fra Angelico, the types of Raffaelle, in which Grecian beauty is visible; and to avoid the fault of which they accused the Dutch School, of not knowing how to idealise the real, they fell into the opposite extreme of being unable to realise the ideal. Certainly no school represented by men who could paint at all could have been more insipid and academically dull than this German revival school, which, indeed, seems hardly worthy of a place in a book dealing with the names and schools which make the essential greatness of German and Dutch art. While noticing the subject, one may be allowed to question whether it is entirely true or just to say that the Dutch painters could not idealise the real. Artistically speaking, there certainly seems to be something like idealisation in the splendid way in which the arrangement of light and composition is often made to give such force and meaning to groups of figures in themselves, no doubt, prosaically realistic.

The history of the Flemish School shows the same kind of influence, and consequent weakening of the art, at a far earlier period, when the Flemish painters began, as has been said, to *Italianise*, and aim at emulating and imitating a school of painting and a class of pictures quite alien from the natural genius of the Flemish mind. The author points out how the portrait painters, such as Antonio More, drawing direct from nature, maintained the superior and robust qualities of Flemish art even when the treatment of ideal subjects had become little more

than an imperfect imitation of Italy. The revival of a genuine Flemish art came with Rubens, to whom naturally a considerable space is devoted, and of whom the author speaks with the degree of enthusiasm which Rubens, as a painter and as a man, does naturally evoke, in spite of all the faults, and in some sense, vulgarities, of his art. These faults the author does not omit to emphasise strongly, but he does full justice at the same time to the greatness of this princely man and powerful painter, who will always be one of the finest and most fascinating figures in artistic biography.

In considering the Dutch School, the author devotes some attention, first, to an earlier and little known Dutch School, the school of the fifteenth century, or commencing in that century, and having little affinity with the brilliant realistic school of the seventeenth century. In commenting on this latter school, we observe that the author does admit the existence of something higher than mere realism in the great Dutch painters, and his remarks on this subject are very good. "We must not suppose that the Dutch School in its realistic character presents nothing but a brutal materialism, and never rises above the delineation of drunken boors at a village inn. There is a *truthfulness* in the Dutch pictures which commands admiration; a dead tree, by Ruisdale, may touch a heart; a bull, by Paulus Potter, may speak eloquently; a kitchen, by Kalf, may contain a poem. All the painters of this school confined themselves to loving, understanding, and representing nature, every one adding his own feelings and tastes,—in fact, adding *himself*. If we visit various parts of Holland in different kinds of weather we shall see how each painter identifies *himself* with the special aspect which he depicts. A barren, gloomy landscape under a leaden sky, unrelieved by living creature, its grim monotony only broken by a waterfall or a dead tree, at once shows in Jacob van Ruisdael the melancholy Jacques of landscape painters, who finds 'tongues in trees, books in the running brooks, sermons in stones.' A bright early morning, when the sun flashes merrily on white sails and glancing streams, and the fat cattle are browsing knee-deep in the rich meadows, reminds us of the lover of light, Aelbert Cuyp. A warm afternoon, when the shadows of the fruit-trees lie across the orchard, and an ox, or horse, or some other animal lies in the grateful shade, tells us of Paulus Potter, the Raffaelle of animal painters, the La Fontaine of artists"; and several other illustrations are given. To some of the painters of interiors the author scarcely seems to do the same justice. He dismisses Ter Borch* (Terburg) very slightly, observing that his *spécialité* was the painting of a white satin dress, by which the chief light in his pictures is formed. But if there is not poetry and imaginative feeling in some of the figures which wear this dress, those qualities can seldom be claimed for any figures in the costume of real life. The illustration of Terburg given on the opposite page, the picture of "The Letter" (in the Hermitage) is, in itself, an example of this. The figure with her back to us is, nevertheless, full of expression and character.

While commending the general tone of the book in its literary style and critical remarks, we may bestow more than commendation on the illustrations. For a five-shilling book they are really marvellous in number and style of execution.

Miscellanea.

Auckland New Cemetery.—At a special meeting of the Auckland Burial Board on the 14th inst., Canon Long presiding, Mr. Pritchett, the architect, attended, when forty-two tenders for the laying-out of the grounds and erecting the necessary buildings for a cemetery were considered. It was, however, decided to call a vestry meeting for the purpose of securing sanction, as required by law, to the proposed expenditure; and the further consideration of the tenders was adjourned till after the vestry meeting.

Mr. Poynter, R.A.—We understand that Mr. Poynter, R.A., has resigned his office of Director for Art and Principal of the National Art Training School at South Kensington.—*Times.*

* A special point is made in the book of giving the correct spelling of all the painters' names, and not the forms into which they have been corrupted.

Metropolitan Provident Medical Association.—On Saturday afternoon, at the invitation of the Duke of Westminster, a meeting was held at Grosvenor House to consider the claims of the Metropolitan Provident Medical Association and its subsidiary financial ally, the Metropolitan Dispensaries Joint-Stock Company (Limited). The object of both is to extend to the working classes, in every part of London and its environs, on terms within their means and consistent with their independence and self-respect, the advantage of medical treatment on the same satisfactory footing on which it is enjoyed by the upper classes, including skilled nursing and a recommendation to a general or special hospital when the case requires it. It had been announced that the duke himself would preside; but at the outset of the proceedings Sir Charles Trevelyan read a letter from his Grace regretting his inability to be present, but expressing his deep sympathy with the movement, in proof of which he said he had subscribed for 500 fully paid-up shares of 1*l.* each in the financial company. In these circumstances Mr. Stansfeld, M.P., the chairman of the Association, presided. Mr. Stansfeld, having briefly defined the object of the meeting, said the conditions on which they were asked to invest in the company afforded a safe guarantee that their money would not be wasted. Proper medical treatment for the working classes was greatly needed, and many had been studying how that want could best be met. He believed that the solution of the problem would be found in provident dispensaries. The present system of gratuitous outdoor medical relief tended to demoralise and to pauperise, and they wanted to cover London with self-supporting dispensaries. The Metropolitan Provident Medical Association would take upon itself the propaganda, and would help the dispensary during its infancy, and until it should become self-supporting and therefore self-governing. The amount of capital which was wanting from the public for the subsidiary limited company was 50,000*l.* Resolutions in favour alike of the association and of its financial auxiliary were carried, after addresses by Sir Rutherford Alcock, Sir Sydney Waterlow, M.P., Mr. Timothy Holmes, F.R.C.S., Mr. W. G. Bann, Sir Charles Trevelyan, and others.

Industrial Schools.—On Monday last an industrial school for girls, on the principle of the industrial schools for boys, was opened at Feltham, Middlesex, under the auspices of the Middlesex magistrates and others. The magistrates of Middlesex since 1854 have passed through the boys' school at Feltham 4,000 of the juvenile offenders, 83 per cent. of whom had turned out well. Encouraged by this success, the magistrates endeavoured to raise by public subscriptions the means of building an industrial school for girls, and funds were subscribed for the purpose of rescuing young girls under fourteen years of age, charged, in many cases, with slight offences, from the disgrace of a prison. The school built for the purpose and ends thus described stands within a mile of Feltham Station, on the South-Western Railway. Mr. E. E. Antrobus, J.P., one of the committee, conducted the visitors over the school, and said it was nearly twenty years since he had first proposed to the Middlesex magistrates that they should apply for an Act of Parliament to enable them to establish industrial schools in the county. The building was judged by the company to be well adapted for its purpose of training girls to an industrial life.

City Churches.—At a meeting of the Council of the City Church and Churchyard Protection Society, Mr. E. B. Ferrey in the chair, the following resolution, proposed by Mr. Henry Wright, honorary secretary, and seconded by Mr. H. C. Richards, was carried *nem. con.*:—"That the Council of the City Church and Churchyard Protection Society regret the recent attack upon the City churches, and the threatened wholesale destruction of so many more, which they, on behalf of their numerous members throughout England, pledge themselves systematically to oppose by every means in their power."

Parish of St. Mary-at-Hill.—The Vestry of this parish have elected Mr. Alexander Peebles, F.R.I.B.A., of Salters' Hall-court, Cannon street, as their surveyor, in succession to the late Mr. John Collier, deceased.

Public Hall, Belper.—The directors have selected the design submitted by Mr. John Johnson, architect, Queen Victoria-street, London.

A New Cemetery for St. George's, Gloucestershire.—On the 12th inst. Mr. S. H. Terry, C.E., Local Government Board Inspector, held an inquiry at the Parochial Offices, St. George's, respecting an application which had been made by the St. George's Local Board to the Local Government Board for their sanction to the borrowing of 5,000*l.* for the purpose of providing a cemetery for the parish. The chairman of the Board (Mr. W. Butler) and several parishioners, were present. The Rev. A. R. D. Flamsteed explained the position in which the parish was placed owing to the want of accommodation for the burial of the dead. The parish churchyard was practically full two years since, and he had consequently written to the Local Board and to the authorities in London desiring that steps should be taken to provide a cemetery. The accommodation in other graveyards in the parish was comparatively *nil*. The surveyor (Mr. W. Dawson) showed the plans he had prepared for the proposed cemetery. The Inspector commented on the clear way in which the surveyor had arranged the grave space; he had not before seen grave spaces so arranged. The paths, which in most cemeteries took up one-sixth of the ground, in Mr. Dawson's plans only occupied one-eighth. He was favourably impressed with the proposed cemetery, and should report in accordance with what he saw and heard.

Hospitals for Paying Patients.—On Monday afternoon the third annual meeting of the Home Hospitals Association for Paying Patients, of which the Duke of Northumberland is president, was held at No. 17, Fitzroy-square, W. In the unavoidable absence of the president, Earl Percy, M.P., was called to the chair. Mr. R. A. Owthwaite, the secretary, read the report, which gave a most favourable account of Fitzroy House, No. 16, in the square, which has been established as a hospital to test the principles of the association, and recommended the purchase of the next house, that in which the meeting was held, which might then be set apart for lady patients, reserving Fitzroy House for gentlemen. The report was adopted on the motion of the chairman, seconded by Sir Rutherford Alcock, K.C.B. Dr. Quain proposed "That it is desirable to raise 5,000*l.*, with the object of purchasing the freehold of No. 17, Fitzroy-square, and for finding funds for the necessary fittings and furniture, for providing additional accommodation of a similar kind to that already afforded at Fitzroy House." This was seconded by the treasurer, Mr. Frederick Cox, and carried unanimously.

Fire at Messrs. Doulton's.—On Sunday morning, shortly after eight o'clock, a destructive fire broke out in High-street, Lambeth, upon the extensive premises of Messrs. Doulton & Co., potters, &c. The fire commenced in a large building of recent erection, four floors in height, about 80 ft. by 60 ft. in dimensions, and as an instance of its rapid spread it may be stated that the roof fell in within some twenty minutes of the first arrival of the engines. When the firemen ceased playing upon the premises, the building in which the fire had originated was completely burnt out and the roof destroyed, while an adjoining building of three floors, about 200 ft. by 70 ft., used as moulding-rooms, had, with its contents, been seriously damaged by fire, heat, and water. The cause of the fire is officially returned as "unknown," but it is believed that it was the overheating of a kiln. Messrs. Doulton are insured in the Queen and the Scottish Union offices.

Bursting of a Water-main.—About nine o'clock on Monday morning the Grand Junction Waterworks Company's trunk-main burst in Goldhawk-road, Shepherd's-bush. The pipe is 30 in. in diameter, and as it was connected with a very large head of water, a serious flood was occasioned. The pressure burst up a large portion of the road, but fortunately little or no damage was done to private property. The chairman of the company asks us to state that every effort is being made to restore the water-supply to the town district.

New Shop door Latch.—Messrs. Sabatier & Co., whose special business appears to be to supply ironmongers with all kinds of French hardware, have lately introduced a new latch adapted for doors which are opened hundreds of times in a day. The main part is a coil spring of a steady action, while the lever handles allow a gentle pressure, though the spring is very strong, and is easily removed to allow the shutter to be fixed when closing. This latch being nickle-plated has a good appearance.

The Brighton Parade Fence.—The Marine-parade at Brighton has received an addition which is both useful and ornamental, in the shape of a fence. It commences at the aquarium and terminates at the junction of the Madeira-road with the Marine-parade, not far from the eastern boundary of the town. The straight portion, which is fixed at the edge of the cliff, is 5,400 ft. long, and consists of massive iron standards placed 8 ft. centre to centre, each weighing 3¼ cwt., between which are bolted panels weighing 4¼ cwt., and a top rail of teak 4 in. in diameter is fixed above, forming a comfortable rest for visitors to lean upon. At intervals there are ten balconies which form recesses for seats, from which an uninterruped view of the sea, beach, and Madeira-road below can be obtained. There are also four flights of stone steps nearly 50 ft. high, down which similar iron fencing has been fixed, and this, added to the straight part, gives a total length of 6,160 ft. of ironwork. The standards are placed on a bed of Portland cement concrete, and a wall of the same material is formed round and between them forming a facia and coping 2 ft. 6 in. on the front. Altogether there are about 350 tons of iron and 750 cube yards of concrete. The stone steps and footpath have also been relaid throughout. The fence was designed by Mr. P. C. Lockwood, the borough surveyor, and the works have been set-out and superintended by Mr. W. Parsey. Messrs. C. Reed & Son, of Brighton, supplied and fixed the ironwork, and Mr. J. G. B. Marshall was contractor for the concrete and other work. The fence has been carefully ranged to straight and curved lines on the top of the old wall which is not quite regular on plan, and the gradients of the fence have been arranged to give as nearly as possible a uniform fall for the water to the kerb.—*Iron.*

The Social Education of Wo kmen—The fourth annual meeting of the Workmen's Social Education League was held last Saturday in the hall of the Society of Arts, under the presidency of the Earl of Dalhousie. From the annual report it appeared that the league had made satisfactory progress during the last year. Since the last annual meeting 201 lectures had been delivered. The committee had reason to believe that the lectures which had been given had led to a considerable amount of individual reading and study on the part of those who had attended them. The balance-sheet showed that whatever success had been achieved had been attained at a trifling cost, in consequence of almost all the work having been done gratuitously. The chairman, in moving the adoption of the report, said the society had been about three years in existence, and it was only last year that it had suddenly struck into something like prominence. Its object was to organise lectures and discussions, especially in working men's clubs and working men's institutes on such matters as history, social and political science, economical science, &c., in order to lay the groundwork in men's minds for the formation of mature and solid opinion upon political questions. The report was adopted. Among the resolutions was one for the changing of the name of the society to "Social and Political Education League."

Royal Architectural Museum.—We have received a letter from the chief officers of this institution, now hidden away in Tufton-street, Westminster, appealing to the public for assistance. An ill-contrived building on an ill-selected site have been the almost fatal obstacles to its progress against which it has had to fight. The writers say:—

"The museum has, in addition to its other objects, a sketching-club, which is much used. Unhappily, however, at a time when the museum has won for itself a solid and grateful recognition by workmen such as it has never before been able to claim, it finds its usefulness much crippled owing to the death of many of its old subscribers, and the difficulty experienced in securing the sympathy of fresh friends to whom its early struggles are naturally unknown. The amount required, in addition to its present income, to keep the museum afloat is about 200*l.* a year, and for this sum its managers earnestly plead. Donations and subscriptions will be received by Mr. R. Druce at the Museum, or by our bankers, Messrs. Cocks, Biddulph, & Co."

Land in Yorkshire.—At the Mart, on Wednesday in last week, Messrs. Edwin Fox & Bousfield sold the Finningley Estate, Yorkshire, consisting of 2,418 acres, which, with the buildings and cottages, thereon, produces a rental of 2,200*l.* The first offer for the property was 40,000*l.*, and the biddings advanced to 60,000*l.*, at which amount it was sold.

Gas Explosion at Camden Town.—A singular explosion, which might have been attended with very serious consequences, occurred early on Wednesday morning in the Chalk-farm-road, Camden-town. The road crosses the Regent's Canal by an iron girder bridge, erected four years ago. The roadway is divided from the foot pavements by hollow girders made of heavy iron plates, with cappings and other ornaments. The gas company, instead of running their main along the bridge in the ordinary way, have, it is stated, made use of one of these hollow girders as a pipe or tube for connecting their main. About half-past five o'clock on Wednesday morning a lamplighter, who was cleaning a lamp close by, noticing a strong smell of gas, approached the girder with a light. A violent explosion followed, splitting the girder, throwing the man into the roadway, and doing considerable damage to the bridge. One portion of the girder, weighing about 8 cwt., was blown a distance of 16 ft. The lamplighter was fortunately uninjured. Mr. Booth, the surveyor of the district, was soon on the spot with some of his men. He did not find it necessary to stop the traffic. Later in the day Mr. Booth Scott, the chief surveyor, accompanied by several members of the Committee of Works and the manager and district superintendent of the gas company, made a minute examination. It is supposed that the ironwork having expanded from the heat of the weather, air had made its way into the hollow cappings and so become mixed with the gas. Had the explosion occurred half an hour later, large numbers of men would probably have been crossing the bridge on their way to work.

The Westmorland Sea-Green Slate is now protected by a registered trade-mark, which may be seen by referring to our advertising columns. We find, by a reference-list sent to us, that these slates are largely used for the best buildings in the British Isles, and are evidently in favour with the leading Gothic architects of the day. Amongst the buildings covered with these slates we notice St. Thomas's Hospital and a long list of other important structures.

Bow-street Police Courts.—Complaints reach us of the bad acoustic qualities of the new Police Court in Bow-street.

TENDERS

For buildings for the Moseley and Balsall Heath Institute, Birmingham. Mr. W. Hale, architect. Quantities supplied:—

S. Taylor	£4,100	0	0
T. Smith	4,000	0	0
W. H. Parton	3,933	0	0
J. Moffat	3,743	0	0
W. Matthews	3,726	0	0
J. Barnsley & Sons	3,678	0	0
W. Brooks	3,665	0	0
B. N. Smith	3,543	0	0
J. Bowen	3,494	0	0

For finishing three detached dwelling-houses at Wallington, Surrey, for Messrs. Parkers. Mr. A. Bradley Rooke, architect. No quantities:—

Rose	£1,795	0	0
Hazel	1,610	0	0
Young & Co.	1,470	0	0
Uff	1,416	0	0
Knight	1,286	5	0
J. O. Richardson	1,207	0	0
Baxter	1,130	0	0

For alterations, &c., to the Green Dragon, Poplar, for Mr. Davis. Mr. W. E. Williams, architect:—

Wood & Sleep	£478	0	0
Eaton	464	0	0
Marr	441	0	0

For rebuilding the Roebuck, Enfield Highway, for Messrs. J. Carter, Wood, & Co. Quantities by Mr. E. Crutchloe:—

Curtis	£2,410	0	0
Field & Sons	2,286	0	0
Toms	2,126	0	0
Boyce (accepted)	1,970	0	0
Tyers	1,260	0	0

For alterations and decorations to 17, Kensington Garden-terrace, for Mr. A. Stuart:—

John Vears & Co. (accepted)	£750	0	0

For alterations and additions to 48, Baker-street, for Mr. W. J. Jameson:—

John Vears & Co. (accepted)	£391	0	0

For warming and ventilating the new schools, Stockton-road, Sunderland, with new hydro-caloric apparatus. Mr. J. P. Pritchett, architect:—

J. Weeks & Co. Chelsea (accepted)	£2 3	17	6

For manager's house and boundary-walls for Sevenoaks Gas Company. Mr. A. Penny, architect:—

Duntnall, Brasted	£1,039	0	0
Haisman, Foots Cray	1,007	0	0
Wiltshire, Sevenoaks (accepted)	1,005	0	0

For building a stable in the Station-road, Forest Gate, for Mr. G. Roberts. Mr. E. Brown, architect:—
Dyer & Son (accepted).

For the erection of a villa in Haling Park, Croydon, Mr. D. R. Dale, architect:—
For concrete basement:—
Hoare & Son, Blackfriars-road (accepted).
For the superstructure:—

W. Marriage, Croydon	£4,204	0	0
T. W. Smith & Son, Essex-road, Islington	4,190	0	0
Maides & Harper, Croydon	4,170	0	0
Barton, Walthamstow	4,146	0	0
Faukner, Old Kent-road	4,123	0	0
Hoare & Sons, Blackfriars-road	3,987	0	0

For the erection of a new folding-room at the Steyne Mills Laundry, Acton, for Messrs. Rush & Co. Mr. E. Monson, jun., architect. Quantities supplied:—

E. Eydmann, Acton	£387	0	0
C. Maton, Kew	347	0	0
J. Dorey, Brentford	338	0	0
T. Nye, Ealing (accepted)	319	5	0

For erection of a house and laundry in Strafford-road, Acton, for Mr. T. J. Howell. Mr. E. Monson, jun., architect:—

T. W. Whiteman, Acton (accepted)	£800	0	0

For the erection of a new wing to the Infirmary for the Guardians, Brentford Union, Isleworth. Mr. E. Monson, jun., architect. Quantities by Mr. F. T. W. Miller:—

C. W. Reading, Belgravia	£4,089	0	0
Shuff & Co., Acton	4,089	0	0
Stevens & Bastow, Bristol	3,859	0	0
Nightingale, Lambeth	3,797	0	0
Vernon & Ewens, Westminster	3,790	0	0
H. Haynes, Alperton	3,750	0	0

J. H. Johnson	2,353	0	0
W. Shurmur	2,327	0	0
S. Salt	2,255	0	0
Hawkings	2,100	0	0

For the erection of manager's house and boundary-walls at the Gas Works, Sevenoaks, for the Sevenoaks Gas Company. Mr. A. Penny, architect:—

Duntnall	£1,039	0	0
Haseman	1,007	0	0
Wiltshire (accepted)	1,005	0	0

For painting, &c., to the United Westminster Schools, for the Governors. Mr. R. R. Arniz, architect:—

Clemence	£486	0	0
Smith & Co.	462	0	0
McLachlan & Sons	398	10	0
King & Son	398	0	0
Adamson & Sons	376	0	0
Smith	350	0	0
Wilkes	270	0	0

For repairs and decorations to 97, Westbourne-terrace, for Mr. M. Jaffé. Messrs. Joseph & Pearson, architects:—

McLachlan & Sons (accepted)	£640	0	0

For the erection of mineral water premises, for Mr. E. Bonser, Nottingham. Mr. F. Jackson, architect:—

Bell & Son	£1,176	10	0
Marriott & Wartnaby	1,157	10	0
E. Hind	1,119	0	0
R. Middleton	1,050	0	0
Smith & Attewell	1,029	18	10
Huskinson & Jefferys (accepted)	1,014	0	0

For the raising of master's house of All Saints' Schools, Nottingham. Mr. F. Jackson, architect:—

Bell & Son	£163	0	0
Smith & Attewell	160	10	0
R. Middleton	150	0	0
Huskinson & Jefferys	145	14	0
Marriott & Wartnaby (accepted)	135	0	0

For raising roof and erecting new floor, in building at west side of Imperial Colour Works, Bow, for Messrs. J. W. & T. A. Smith. Mr. A. Ashbridge, architect:—

Palmer	£120	0	0
Calnan & Co.	105	0	0
Goodman*	95	0	0

* This tender did not include surveyor's fees.

For repairs to roofs, &c., at the Vine-street Casual Wards, for the Guardians of the Poor of the Holborn Union. Messrs. H. Saxon Snell & Son, architects:—

Howard	£238	0	0
Bamford	221	0	0
Morris	200	0	0
Patten (accepted)	182	0	0

For repairs to houses in Luscombe-street, Wandsworth-road, for Mr. F. J. Purssord. Mr. R. Cruwys, architect:—

Smart, Brixton	£180	0	0
Stevens, Wandsworth	120	0	0
Farquharson, Wandsworth (accepted).			

For rebuilding Wisbey Wharf, Bow-common, after fire, for H. W. Walden:—
Parrish (accepted)

For alterations and additions to the Prince of Wales public-house, Deptford, for Mr. E. Behrens:—
Parrish (accepted)

For Board schools at Orpington, Kent. Mr. J. Ladds, architect:—

Watson & Dennett	£2,487 15 0
Taylor & Son	2,269 0 0
J. E. Julian & Co.	2,226 0 0
Gallard	2,221 0 0
Morris	2,220 0 0
Payne	2,205 0 0
Haisman	2,200 0 0
Wright	2,193 0 0
Eldridge & Gee	2,188 0 0
Elwig	2,133 0 0
Bingham	2,126 0 0
Marsland	2,110 0 0
Willicomb & Oakley	2,100 0 0
Jones & Co.	2,062 0 0
Higgs	2,049 0 0
Beale & Son	2,030 4 9
Warr	2,022 15 0
Waite (accepted)	1,846 5 0

For alterations and additions to the Downs, Tawcie Park, Sydenham. Messrs. Edwin & W. Hilton Nashe architects:—

Greenwood	£1,693 0 0
J. & C. Bowyer	1,680 0 0
S. J. Jerrard	1,609 0 0
O. Jarrett	1,494 0 0
C. Coles (accepted)	1,479 0 0

For a pair of houses, coal-store, and stabling for Mr. H. Moore, at Ryde, Isle of Wight. Mr. R. J. Cornewall Jones, architect. Quantities supplied:—

Stevens & Sons, Southampton	£2,246 0 0
Jenkins, Bros., Ryde	2,135 0 0
Light & Co., Portsmouth	2,102 0 0
Barton, Ryde	2,070 0 0
Berwaker, Southsea	2,050 0 0
Jolliffe, Sandown	1,980 0 0
Sibley, Ryde	1,758 5 0
Saunders, Ryde	1,745 0 0
Meader, Ryde	1,650 0 0
Salter, Ryde	1,550 0 0
Hutchings, Binstead	1,511 0 0

For the Pinner sewerage and outfall works:—

H. Haynes, Alperton, Harrow	£11,450 0 0
F. Larter, Harrow Weald	11,070 0 0
W. Botterill, Cannon-street	10,551 0 0
J. Cardus, Acton	9,900 0 0
G. Stevenson, Ecklington, Derbyshire	9,810 0 0
C. Killingback, Camden Town	9,750 0 0
J. Jackson, Upton, Essex	9,740 0 0
Bottoms, Bros., Battersea	9,104 0 0
J. Neave, Lewisham	8,940 0 0
Nowell & Robson, Kensington	8,880 0 0
B. Nicholson, Chelmsford	8,839 3 4
Ford & Co. Great Queen-street	8,200 0 0

W. Coker, Great Hadham	7,591 13 0
G. G. Rayner, Boolle, Liverpool	7,340 0 0

For alterations and additions to the London and South Western Bank, Camden Town Branch, 68 and 69, Parkstreet. Messrs. J. & J. S. Edmeston, architects:—

	If wholly in Stone.	If in Cement.
Higgs & Hill	£4,430	£4,230
R. White	4,248	3,949
Gould & Brand	4,157	3,947
Clarke & Bracey	4,180	3,720
T. Nye	4,058	3,819
J. Smith & Son	4,037	3 696
Boyce	3,989	3,789
W. Smith & Son	3,889	3,610
Lucas & Son	3,141	3,110

For the erection of a cottage in Croft-road, Carshalton, Surrey, for Mr. P. C. H. Jay. Messrs. Ebbetts & Cobb, architects. Quantities supplied:—

Clarke & Bracey	£587 0 0
Langley & Pinkham	568 8 0
Humphries	529 0 0
J. O. Richardson	529 0 0
Stewart	528 0 0
Ward	510 0 0
Evans	498 0 0
Holt	466 13 3

For Cardiff Church. Mr. H. T. Northcroft, architect. Quantities supplied:—

Wall & Hook, Brimscombe	£10,500 0 0
Estcourt, Gloucester	8,989 0 0
Stephens & Bastow, Bristol	8,649 0 0
Shepton, Cardiff	8,340 0 0

For cottages at Hutton Cranswick, for Mr. Dosser. Mr. W. Hawe, architect:—

T. T. Dickinson, Driffield	£436 0 0
M. Gage, Driffield	430 0 0
G. & R. Pape, Beverley	425 0 0
John Barnes, Beverley	390 0 0

For farm buildings at Hayes Gate Farm, Hayes, Middlesex, for Mr. H. P. Cotton:—

Hunt	£850 0 0
A. & B. Hanson	837 0 0
Postlethwaite	726 0 0
Pocock	822 0 0
Kearley	649 0 0

For building new wing and alterations to 106, Westbourne-terrace, for Mr. A. L. Cohen. Messrs. Joseph & Pearson architects:—

M'Lachlan & Sons (accepted)	£1,598

For alterations and additions for Messrs. Grant & Grant, Forest Hill. Mr. Goodsack, architect. Quantities supplied:—

Heath	£1,910 0 0
Marriage	1,899 0 0
Masters	1,785 0 0
Potterton	1,697 0 0
Taylor & Parfitt	1,690 0 0

For alterations to business premises at Leytonstone, for Messrs. F. Dutch & Co. Mr. D. R. Dale, architect:—

Farr & Co.	£437 0 0
Hoare & Sons	425 0 0
Arber (accepted)	360 0 0
Barton	351 0 0

We are compelled to decline pointing out books and giving addresses.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

NOTICE TO SUBSCRIBERS.

THE INDEX and TITLE-PAGE for Volume XL. (January to June, 1881), were given as a Supplement on July 9th.

A COLOURED TITLE-PAGE may be had, gratis, on personal application at the Office.

CLOTH CASES for Binding the Numbers are now ready, price 2s. 4d. each; also

READING CASES (Cloth), with Strings, to hold a Month's Numbers, price 2s. each.

THE FORTIETH VOLUME of "The Builder" (bound) is now ready, price Twelve Shillings and Sixpence.

SUBSCRIBERS' VOLUMES, on being sent to the Office, will be bound at a cost of 3s. 6d. each.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS, TRADE, AND GENERAL ADVERTISEMENTS

Six lines (about fifty words) or under ..... 4s. 6d.
Each additional line (about ten words) ..... 0s. 6d.

Terms for series of Trade Advertisements, also for Special Advertisements on front page, Competitions, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.

SITUATIONS WANTED.

FOUR Lines (about THIRTY words) or under ..... 2s. 6d.
Each additional line (about ten words) ..... 0s. 6d.

REPLIES TO ADVERTISEMENTS.

Addressed Box —, Office of "The Builder,"

Cannot be forwarded, but *must* in all cases be *called for*, and the Office Receipt produced.

THE CHARGE FOR A BOX IS AS UNDER:—

For "Situations Wanted" Advertisements ..... 3d. per Week.
For all other Advertisements ..... 6d. per Week

PREPAYMENT IS ABSOLUTELY NECESSARY.

. Stamps *must not* be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, King-street, Covent-garden, W.C. to

DOUGLAS FOURDRINIER, Publisher,
Addressed to No. 46, Catherine-street, W.C.

Advertisements for the current week's issue must reach the office before THREE o'clock p.m. on THURSDAY.

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied *direct* from the Office to residents in any part of the United Kingdom at the rate of 19s. per annum, *prepaid*. Remittances payable to DOUGLAS FOURDRINIER, Publisher, 46, Catherine-street, W.C.

Best Bath Stone.
WESTWOOD GROUND,
Box Ground, Combe Down,
Corsham Down,
And Farleigh Down.
RANDELL, SAUNDERS, & CO., Limited,
Corsham, Wilts. [ADVT.

Box Ground Stone
Is the best for use in all exposed positions, being a well-known and tried weather stone.
50,000 feet cube in stock.
PICTOR & SONS,
Box, Wilts. [ADVT.

Doulting Freestone and Ham Hill Stone
of best quality, in blocks, or prepared ready for fixing. An inspection of the Doulting Quarries is respectfully solicited; and Architects and others are CAUTIONED against inferior stone. Prices, delivered to any part of the United Kingdom, given on application to CHARLES TRASK, Norton-sub-Hamdon, Ilminster, Somerset.—Agent, Mr. E. WILLIAMS, 73, Charlotte-street, Portland-place, W. [ADVT.

Doulting Stone and Ham Hill Stone,
of best quality. Prices and Estimates, including delivery to any Station, on application to
STAPLE & HANN, Quarrymen, Stoke-sub-Hamden, Ilminster. Agent, E. CRICKMAY, No. 4, Agar-street, London, W.C. [ADVT.

Asphalte.
Seyssel, Patent Metallic Lava, and White Asphaltes.
M. STODART & CO.
Office:
No. 90, Cannon-street, E.C. [ADVT.

Asphalte.—The Seyssel and Metallic Lava Asphalte Company (Mr. H. Glenn), Office, 38, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds and milk-rooms, granaries, tan-rooms, and terraces. [ADVT.

Immense quantities of
DRY WAINSCOT,
DRY MAHOGANY,
DRY WALNUT,
in all thicknesses.
B. J. HUDSON & SONS,
Whitfield-st., W., and Great Peter-st., S.W., London. [ADVT.

Accidents by Lightning would be unknown, if Gray's Patent System of Conductors were fitted to all buildings.—For particulars, see ADVT.

Water Famine in London.

THE idea of a water famine, with the thermometer approaching 100° Fahr., is not an agreeable one. But during the past few days more than one part of London has had a very broad hint that such a calamity is not impossible. On the 19th of July, in his place in the House of Commons, Mr. W. H. Smith asked the President of the Local Government Board whether he was aware that in those districts of London supplied by the Grand Junction Company there had been an almost total suspension of water supply, and whether the Local Government Board were prepared to exercise the authority they possess in order to make the Grand Junction Company comply with their statutory obligations.

Mr. Dodson had experienced,—we may be pardoned for saying it is satisfactory to hear,—the most direct appeal on this subject, from the fact of a deficient supply in his own house. He had also received notice of the failure of a high-service supply at Brixton, as to which inquiries had been set on foot. The right hon. gentleman also referred to past efforts to bring in a Bill on the subject of the water supply, which the Government had not considered it expedient to re-introduce during the present session. Thus the fact of failure is undisputed. The bursting of a main is said to have been one cause, but it is pretty evident that the mechanical resources of the company are not adequate to bear the stress of the unusual demand for water due to the heat of the month. Looking back to past years, we can say that the extra demand must have have amounted to at least 20 per cent, and very probably to more. Failure under such circumstances is not absolutely inexcusable, as far as any particular main is concerned, but what *is* inexcusable is the want of any alternative or supplemental system, by means of which the supply of so prime a necessary of life should be kept up pending the repairs of any fractured pipe or pump. Provision of this kind the customers of the water companies have the right to demand.

The Grand Junction Water Company supplies an area of 5½ square miles, extending in a very irregular form from Charing Cross to beyond East Acton and Wormwood Scrubbs. Its expended capital, in 1878, was 1,170,125*l.* The character of the district that it supplies, or the costly nature of its works, is indicated by the fact that while the average expenditure of capital by the eight water companies of London is at the rate of 21·8*l.* per house, or 3·05*l.* per unit of population, the Grand Junction has laid out 31·5*l.* per house, or 3·45*l.* per head of its customers. The daily supply furnished by this company is a little above the average of 32·25 gallons per head, being (for the year of which we have the details analysed) 33·6 gallons per head per diem, or 57·7 tons of water per soul per annum. The working expenses of this company, however, are unusually heavy, amounting to 6*s.* 8*d.* per 100 tons of water, while the average cost of the eight companies, including the Grand Junction, is 4*s.* 8*d.* per 100 tons. The main element in this extra cost is the pumping, which cost 3*s.* 9½*d.* out of the above-mentioned 6*s.* 8*d.*, the average cost of pumping for the whole of London being 1*s.* 4½*d.* per 100 tons of water delivered. Nor is it difficult to point out the cause at once of the cost of pumping, and of the extra stress that is evidently thrown upon the machinery and connexions of the Grand Junction Company. Taking its supply from the Thames at Hampton, the company serve a district of which many portions lie above the 85 *ft.* contour line, and of which the highest point is 113 *ft.* above Trinity high-water mark. To this height has to be added the height of the houses, say 40 *ft.* Thus, subject to any relief from districting and subsidiary lifts,—if such there be,—there is a pressure of 158 ft. of head, or nearly five atmospheres, on the mains and connexions of this company, and an amount of dead weight is lifted by the pumps which, measured by the tolerably safe rule of actual cost, is more than two and a half times as much, per ton of water distributed, as that which is raised by the Kent Company from their deep wells. It is thus easy to see a physical reason for the fact that it is the Grand Junction Company which is the first to suffer under the extra stress of an increased summer consumption of water.

Not that the Grand Junction Company is by any means alone in its trouble. The Southwark and Vauxhall has received the same equivocal compliment of Parliamentary notice. By that safety-valve, public indignation is allowed to exhale, at extremely small inconvenience to the companies of which complaint is made. One thing, we apprehend, it has been within the power of the local authorities to control. We have little doubt that much of the want of water, where its absence is most dangerous, that is to say, in the interior sanitary arrangements of the dwelling-house, has been due to the over-watering of the streets. In many cases this has resulted in the production of a thick mud, the steam from which, with the thermometer at 95° and above, has been anything rather than conducive to the comfort or health of the inhabitants of London.

We wish to take the occasion of a pinch which has been so sensibly felt by so many of the inhabitants of London, to renew our often-repeated warning that the water-supply of London is a subject that ought to be regulated on the principles of hydraulics and of sanitary engineering, rather than made a stalking-horse for the speculator, whether financial or political. More particularly have we felt it to be a duty to do this since the curious oversight made by the Registrar-General in 1876, when that officer ventured to assert that the Metropolitan Board, by borrowing 20,000,000*l.*, at 4 per cent., could supply the ratepayers with gas and water at half the present cost. The learned statistician would have been, no doubt, not far from the mark but for his unfortunate assumption that stock paying 8 and 10 per cent. could be purchased by the authorities at the par price of a 3½ per cent. stock. This tremendous oversight having once been made, a perfect harpy flock of speculators endeavoured to swoop upon the prey. We have been, we believe, alone or nearly so in the press, in pointing out on the one hand the inadequacy of the estimate above cited; then the inadequacy of that brought forward by Mr. Chadwick in the rooms of the Society of Arts (on the occasion of the water conference), which proposed to purchase, not gas and water companies for twenty millions, but water companies alone for twenty-six millions. Again were we alone in warning the public, in the opposite direction, against the calculations by which the late Mr. E. J. Smith misled the late Government into the most unfortunate proposal of a plan which would have burdened London with no less a sum than 38,000,000*l.*,* for merely obtaining the property and control of the water-works. Thus between March, 1876, and March, 1880, we have had to maintain (and to prove by details) first, that it was absurd to talk of purchasing the water companies' property for ten millions, or even for twenty-six millions, of money; secondly, that it was absurd (and worse than absurd) to offer them thirty-eight millions for the same property, *plus* the moderate growth in the four years intervening. These are points which ought never to be forgotten when water supply reform is on the *tapis*.

How is it, it may be asked, that the *Builder* has taken a steady middle-course during the four years in which the pendulum has swung so tremendously from side to side as from a 10-million to a 38-million valuation by Government officials?

For this reason, we venture to reply: We have regarded an hydraulic problem as affected by hydraulic considerations, and a sanitary problem as affected by sanitary considerations; and we have given unwearied time and pains, first, to ascertain, and then to co-ordinate, the actual *data* of the case. And by this method (whatever be the success of any particular attempt to use it), and by this method alone, we hold that the problem can be solved.

On the contrary, the first idea of the Registrar-General was to effect a large economy by

* See *Builder*, vol. xxxviii., p. 302.

putting the control of the water-works in the hands of the Metropolitan Board of Works,—an economy which that officer was so anxious to effect that he entirely overlooked the most obviously controlling *data*. The object of the second attempt (we have by us all the papers, printed but not published, for reasons at which we have before hinted) was to enrich private speculators at the expense of the water companies. The object of the third effort was to introduce a grand scheme of Government, or at least of administrative, control. In neither of these cases did the persons who came before the public begin at the beginning, or regard the hydraulic problem as an hydraulic problem. It is so much easier to make assumptions than to analyse facts! That a central Board would do things so much cheaper was the assumption; why this should be so no one attempted to show.

If any good is to be done in the way of improving the water-supply of London, we venture to assert it will only be done by modestly beginning at the beginning. We have to ascertain, first, the requirements of the case; secondly, the mode in which these requirements are now met; thirdly, the mode in which these requirements are to be better met; and fourthly, the equitable and determinate cost of such changes. We are not now about to enter further into this great and important question than we feel compelled to do by the partial breakdown of the last week.

The main reason for a central authority or unity of control in the London water-works, as far as economy of working is concerned, is the saving that can be effected by districting, that is to say, by supplying water according to zones of level. These zones exist on the ground, irregularly, it is true, but in a manner which may be compared to the successive coats of an onion. The territories of the companies, on the other hand, are distributed more like the cloves of an orange. Thus the Thames water is forced up 158 ft. and more by the Grand Junction Company, while the reservoirs of the New River Company at Stoke Newington are 87 ft. above Trinity high-water mark. To supply the higher portions of the Grand Junction district from the New River reservoirs would thus save half the cost of pumping, or 3*s.* 4*d.* per 100 tons of water. This is not a vague estimate, such as those brought forward in support of Sir R. Cross's Bill as to the economy of "concentration," but a simple, definite, certain, engineer's calculation. We are not in a position to state whether this saving might be effected over the entire district served by the Grand Junction Company, because we are not aware of the arrangements of that company for subsidiary lifts, if any. If we suppose the water to be forced by one set of pumps into the entire closed system of pipes, it is certain that the five atmospheres' resistance must act on the entire quantity. In that case an unnecessary expense of more than 15,000*l.* per annum is incurred in the 65,000*l.* of working cost of this company alone. That, as we admit, may be an excessive view of the case; but that whatever portion of the district of this company lies at an elevation of more than 87 ft. above the Thames, might economise that proportionate amount of pumping, if served from reservoirs which the water enters by gravity at that level, is incontestable.

Here, then, in the lesson of this dry and hot July of 1881, we may read a very forcible illustration of the principles advocated in our pages. Engineering questions must first be approached on engineering principles, not on those of the amateur, the speculator, or the politician. When the intelligence of London has grasped this truth, water reform will follow.

Clever Young Man!—A correspondent writes:—A prize being offered for the best plan for a new chapel-of-ease for Bowness and Windermere, about fifty plans were sent in from various parts of the country, and by many well-known and eminent architects. On Saturday, the 25th ult., the committee for examining and choosing the plans met, and a design was fixed upon, the motto of which was "Truth." After passing the usual form of approval and election, the name of the successful architect, wonderful to relate, was found to be Mr. Joseph Pattinson, the fourth son of Mr. Thomas Pattinson, of Bowness, now in the employ of Mr. Ferguson, of Carlisle. These things will happen in the best-arranged competitions.

MONTFAUCON.

We spoke recently of an English translation of Winckelmann's famous "History of Ancient Art,"—the work of an American student,—which has lately made its appearance in England. If to the great German antiquary modern archæology owes its debt of gratitude for the new direction given by his famous book to the study of Classic art, some recognition at least is due to a predecessor of Winckelmann in his labours,—Montfaucon. Montfaucon's name may be almost linked with that of Winckelmann in the reputation it enjoys with the reading public; both are eminently respectable and respected authorities, from whose works and efforts, however, the present generation feels it has little to learn,—they are fortunate, indeed, in comparison with many other studious antiquaries of the past whose names can alone be found in the biographical dictionaries, and whose works remain in their dusty resting-places on the long undisturbed upper shelves of old libraries. But we owe to these seekers into the past our gratitude; indeed, to many we owe the commencements of the noble collections that now rank among the most valued possessions of the nation; we owe to them the fostering, in ages too often given over to frivolity, of the spirit which has led in our day to such remarkable results, and in the case of our local antiquaries we should ever be grateful to them for the gathering and garnering of stores of information we should now find it impossible to acquire for ourselves.

A hundred and sixty-two years separate us from the publication of Montfaucon's first great antiquarian work, "Antiquité Expliquée," with its mass of information on the details of Classic existence. Montfaucon, indeed, may be said to be the first modern writer to have approached this prolific field of research, but with what imperfect tools we can at this date imagine. Sturdily, however, he buckled himself to the task, and, aided by an enthusiasm that was eminently calculated to overcome all obstacles, he laboured, toiled, and cleared the field, the crop from which we now all have it in our power to reap. It was not a mere essay that the learned Benedictine monk attempted; the folio volumes he produced, with their numerous plates, embrace in a very comprehensive manner, even for the present day, the mythology and life of antiquity. We must thank Montfaucon for having first searched the classic authors with a view to elucidating this study. The philosophy of the ancients, or, as our great Bacon calls it, "the wisdom of the ancients," had, till Montfaucon's time, formed the interest of antiquity; since Winckelmann's time, for on him we must look as the founder of the critical study of Classic art, archæology has taken its rank among the subjects of inquiry for Classic students, archæology proper the study of the beginnings of art. But Winckelmann in Montfaucon had a predecessor, who, if he did not approach the subject in the same spirit or with the same aims, at least may be granted the merit of having passed over the same ground; and when we take into consideration the epoch in which he lived, we cannot but be surprised at the result of his efforts, efforts made while the science of which he was so devoted a student was but in its infancy, and supplied with but the most elementary materials. None who may be led to turn over the folio volumes which the industrious Benedictine monk produced, and the numerous illustrations which accompany the text, can fail to be struck by the erudition and research of the author. If of the illustrations it may be said that their quality scarcely bears a relation to their quantity, their merit and accuracy have alone been surpassed since the aid of photography has placed it within our power to produce trustworthy representations of the works of the past. It is scarcely yet in England that we can afford to cavil at the want of careful observation in the illustration of Montfaucon's works. As for their value for reference purposes it remains of course, unchanged.

Montfaucon's "Antiquité Expliquée," translated shortly after its appearance into excellent English, by Humphreys, and published by old Tonson,* has, of course, long since been set aside by later works. We have it, however, on the authority of so distinguished a bibliographical student as Brunet, that it has never been superseded, though the information he gathered has largely served to aid the researches of his successors; indeed, when a work embraces, as does his, a consideration of the whole of Classic mythology treated in detail, with its figured representation, the religion of Egypt, Greece, and Rome, and many other of the nations of antiquity; the costume of the ancients, the plan of their houses, the figured reproductions and description of their various utensils, vases, measures; their public baths, their theatres, and games; their customs and rites, marriage ceremonies, punishments, &c.,—their arts, and the various instruments of their trades and professions;* the whole military system of the Greeks and Romans, their campaign operations, their bridges, aqueducts, navigation, shipbuilding, seaports, &c.,—it can be understood that such a work exhausted all the contemporary existing sources of information. Need we be surprised to learn that, on the appearance of the book "everybody was desirous to read it, —even the ignorant." In two months' time the edition of 1,800 copies was exhausted.†

The production of one such work might appear to afford an adequate effort for the life of any man, but the methodical course of study of Montfaucon enabled him to produce many other works. In the Classic authors he was, as might be supposed, deeply versed; with the bewildering commentary-riddled writings of the early Church Fathers and their complicated theology, he was no less familiar, and numerous are the works which the Catholic Church owed to the industrious Montfaucon. He found time to visit Italy very thoroughly in search of manuscripts, and the summary of his happy wanderings through the then undisturbed convent libraries of the Peninsula he has described at length in his interesting "Diarium Italicum," the fame of the author of which warranted the publication, in London, of two English translations.‡

But not here do Montfaucon's labours end, the continuation into modern times of the task he had undertaken in the explanation of "figured antiquity" he planned and in great part executed. His "Monuments de la Monarchie Françoise" is a remarkable production. In no narrow spirit of idolatry to antiquity and its lessons he approached the subject of the monumental remains of France during the Middle Ages, and where no work previously existed to assist him in the smallest degree, he produced, in the early years of the last century, a work which, if it has since been superseded by later studies, has served as the scaffolding on which they have been built up. Like his work on antiquity, it is no mere sketch, supplied with incomplete information; the sources of reference show an acquaintance with the art of his country that is calculated certainly to amaze the modern reader when he remembers how, until positively recently, the art of the Middle Ages both in France and England was persistently overlooked.

Montfaucon's "Monuments de la Monarchie Françoise" gives us in passably accurate illustrations,—wonderful for the day in which they were produced,—a review of the artistic productions of the various reigns of the French monarchy; an historical sketch is given of each reign, and a fair share of text is devoted to the explanation of and authorities for each of the numerous plates that adorn the volumes. Through reign after reign the illustrations run, from earlier works than the Bayeux tapestry, which is here reproduced in a number of double folio page illustrations, and with an accuracy which, if it is no longer acceptable to those familiar with the photographs made of this interesting historic work, and published some years since by the Arundel Society, is still sufficient for almost all reference purposes.

The success of Montfaucon's "Monuments of the French Monarchy" was scarcely less than

---

* This translation, "Antiquity Explained," was published at London, 1721-25, ten vols. in three, folio.

* "In the arts," Montfaucon remarks,—we quote Humphreys' translation,—"there are three things to be considered, the precepts, the instruments, and the works. Of the first of these we shall take no notice, it being both beyond our ability to treat of it, and also what would require as large a work as this collection." Of architecture he truly remarks that it requires the greatest number of instruments. He then proceeds to describe, with illustrations, the classic axe, rule, square, the compass, "one with straight the other with crooked feet"; the plummet, chisels made of brass, for, as he observes, the ancients were acquainted with methods by which brass could be rendered of great strength, plates of brass being used to bind the courses of stone [bronze is the metal, doubtless, meant by Montfaucon]; for the same purpose ties of wood were used in antiquity, shaped at each end in swallow's tails. The joiner's tools are also described,—the saw, the mallet, and plane, of which a somewhat rude representation will be found at p. 216 of the third volume of Humphreys' translation.

† Vinet's "Bibliographie des Beaux Arts."

‡ One published 1712, the second, by J. Henley, 1725.

that of his "Antiquity Explained," and, as in the case of that work, an English translation appeared (1750) embellished with no fewer than 300 plates. If Montfaucon's work has been long since superseded by later publications, the writings of Labarte, Du Sommerard, Alex. Lenoir, d'Agincourt, Lenandre, the far too little known Willemin, Viollet-le-Duc, and, more recently, Lacroix, in his popular works on the Middle Ages, like those students, we must never refuse our meed of gratitude to the industrious old antiquary who, after a youth spent as it was customary for the youths of noble families of those days to indulge in, left a brilliant military career, during the stirring campaigns of Turenne, to devote himself till his death at the ripe old age of eighty-seven, to the seemingly less alluring pleasures of deep and earnest study. Born in 1655, he renounced the world at the exceptionally early age of twenty, and entered the Benedictine order; a visit to Italy in the last years of the seventeenth century,—a visit undertaken in the interests of his literary researcb, and the result of which he has left in his "Diarium Italicum," to which reference has above been made,—is the only incident that may be said to have broken this long lifetime of devoted study.

In one of the quiet side chapels of the interesting old church of St. Germain-des-Près in Paris, now rest, within but a few feet of the ashes of the great Descartes, and not far from the last resting-place of the poet Boileau, the remains of Dom Bernard de Montfaucon, side by side with those of his brother Benedictine Mabillon, a scarcely less distinguished antiquary than himself. In accordance with an excellent and almost undeviating system adopted by the Paris municipality, and the absence of which is much to be regretted in London,—a street in the neighbourhood of St. Germain-des-Près bears the name of Montfaucon.

WARMING AND VENTILATION AT THE SANITARY EXHIBITION, SOUTH KENSINGTON.

ONE of the first things that strikes the inquirer in attempting to sum up the results of this exhibition in regard to warming and ventilation, is that in this department at least there is not the slightest pretext for the application of the epithet "International" to the Exhibition. The committee, doubtless, did their best to induce foreign inventors to send their works, but have not succeeded. The Exhibition merely illustrates what has been thought of and practically carried out in England. We wish it were otherwise. A really International Exhibition of Appliances for Heating and Ventilation might be very instructive in showing us how such matters are dealt with in other countries. As it is, the international element, as far as apparatus is concerned, seems to be summed up in the apparition of an "Anglo-German stove," which we noticed with that label affixed to it. Perhaps it may be contended that some not unimportant nations have scarcely turned their attention to ventilation at all, not having yet arrived at the recognition of its importance; and probably English sanitarians have done more than any others in promoting attention to the subject; but in the matter of practical means of ventilation we probably might find that the Americans and the French have done the thing more completely, in some instances, than we have. The first point, however, is to get it recognised as a primary principle that buildings for human habitation ought all to be provided with effective means of continually changing the air, not by haphazard, but in a certain and reliable manner, and that domestic architecture in which this is not accomplished is incomplete and radically faulty. There is evidence in the Exhibition that there are a good many means already within reach by which efficient ventilation may be secured, if people can be got to regard this as a *sine quâ non* in a dwelling-house. At present very few people do so regard it, and as no system of ventilation is costless, they draw back from paying extra for what they still regard as a luxury rather than a necessity in house-building.

Considering the ventilating appliances generally, we seem to find a great deal of repetition of contrivances differing little either in theory or practical working. Ventilating cowls warranted to create an up-current are to be found in slightly varying forms all over the exhibition, accompanied by models fixed on glass funnels with a bit of pith or cotton wool inside by which the drawing powers of the cowl can be visibly demonstrated. There is no difference in principle in these, and they all act properly in the models; but that does not take us very far. We all know how that an induced current is easily set up with contrivances of this kind: the real question is, Under what circumstances and in what direction are currents to be maintained for the production of ventilation? We find very little evidence of a real scientific principle in the conduct of ventilation in most of these contrivances and the methods of applying them. Inlets and extracts for ventilation must be considered conjointly and in regard to their effect upon each other, not separately. Ventilation consists in the provision of means for adequate inlet (without draught) and adequate extract, working in union with each other; and if it is decided on what principle inlet and extract are to be formed and regulated, the mechanical method of promoting extract becomes a mere matter of detail.

We may divide schemes of ventilation into three classes; those which may be termed natural ventilation, in which the difference of pressures between external pure air and internal vitiated air is relied upon to keep up the current; those which are worked by mechanical propulsion; and those which are in connexion with the heating system of the building, and actuated by artificial warmth. Among these there can be no doubt that mechanical propulsion is the most certain and effective, but it has the drawback that it involves a continual cost unless in the exceptional cases in which, as in buildings where machinery is constantly employed, a power already necessarily in action for the purposes of the building can be utilised to drive the ventilation also. It cannot, therefore, be expected that mechanical propulsion will come into general use for the ordinary run of dwelling-houses, although for the better class of houses Messrs. Verity's fan-propeller, driven by water, is a very useful form of ventilator. Its general use in large towns would involve too great a demand on the water supply, independently of the expense to individuals; but it is the only form of mechanical propulsion which we observed in the exhibition which would be at all suitable for even partial adoption for domestic ventilation.

Natural ventilation pure and simple may be said to have only one illustrator in the exhibition who lays special claim to that merit of naturalness. Mr. Boyle's system has this to recommend it in principle, that it follows the natural movement of air in an inhabited chamber, from the floor towards the ceiling, and extracts it from the upper part of the room. We have always held that the upper portion of the room is the place for the extract, and that it is absurd and unscientific to attempt to draw the vitiated air down again for extraction when it has once, heated by use, risen to the top of the room. On the other hand, admitting air through the skirting, even with the protection from direct influx which Mr. Boyle's apparatus provides, is too crude a method of inlet, and must create draughts along the floor when there is a fire burning. While the fire is burning, the current up the flue is supposed to assist in carrying off the vitiated air, the discharge for which is into the chimney, with mica valves light enough to open to the extract current, but closing the opening against back-draught. If the extract were made into a ventilation flue contiguous to and merely warmed by the smoke-flue, there would be little occasion for the mica valves, the proper action of which we very much doubt. And even if it were recognised as a success and universally adopted, where is all the mica to come from? Certainly a question to be asked.

There is another scheme which comes nearly under the head of natural ventilation, although it is rather complicated in its working, and that is the scheme propounded by Dr. Hayward and Dr. Drysdale, and shown in a working model of a house. Dr. Hayward's scheme (for it was his originally) was brought before the Institute of Architects and published in their Transactions some time ago, but the form shown in the Exhibition is modified in one particular, in that the "primary inlets," as they are called, are on the roof, whereas they were in the basement in the original scheme; the change has apparently been made with the view of getting purer air. The system, some of our readers may remember, is one in which no air is admitted into the house except through the contrived ventilating inlets, and no air suffered to escape except through the contrived outlet, which is an upcast shaft helped by the heat of the kitchen fire; in other words, the windows are fast and hermetically closed. The system appears to answer its purpose capitally, and to work exceedingly well; but it is useless to propound it, because no English people, except a few persons absorbed with fancies about ventilation, and willing to sacrifice everything to them, would ever consent to live in a house in which the windows would not open The system is very ingenious; it has just the drawback that no one ever would adopt it, and therefore it must be dismissed as unpractical.

In this scheme, we may observe, Dr. Hayward introduces the pure air from the "pure-air chamber," at the top of the room, and removes it also at the top, at the further side. Introduction at the top of the room we believe to be a mistake to begin with. Dr. Hayward speaks of the air as falling into the room through the inlet and then ascending again to the outlet. True, it will fall into the room if it is cold air, but it is then apt to cause draughts; if it is warmed before entering, it will not fall, and is likely to cross the ceiling to the outlet, without doing much good on its way. Our most decided and deliberately formed opinion is that the point at which to introduce fresh air into a room is a few feet, about 4 ft. or 5 ft., above the floor. Whether cold or warmed it has then the best chance of mingling with the air of the room, and at the same time of displacing and assisting to drive up the vitiated air, which, as we have before said, once up at the ceiling, should never be tempted to descend again. This we stand by as the proper system in regard to the points of introduction and removal of air. Introducing the air at the floor level is not in itself objectionable when the air is artificially warmed, but it is not so easy to warm it artificially, by the fire at least, for that level as for a higher level, and then there is the drawback that in summer, when the artificial warming is not in action, there will be draughts along the floor, and in fact that there ought, in that case, to be two inlets, one for winter and one for summer; whereas the inlet higher up will answer equally well in both cases.

Taking the instance where air is admitted without being warmed, we want in that case to have it introduced in such a way as to avoid direct draughts near its entry. This is what is effected by the much-vaunted vertical tubes which are now everybody's panacea for the production of efficient ventilation, but which have the drawback of sending the air too decidedly in a stream up to the ceiling, and of being harbouring-places for dust and dirt, and very difficult to clean or inspect. This has been so far recognised that canvas strainers, in the form of inverted cones, have been fitted to the tubes to prevent the influx of air bringing up dust and dirt; but this does not facilitate the cleaning of the tubes any the more. All the advantages of these so-called Tobin tubes are attained, without their peculiar disadvantages, by Stevens's drawer inlet ventilator, exhibited by the firm bearing the very big title of the "Universal Ventilating, Sanitary, and Engineering Company." This provides for the direct admission of fresh air through a strainer, and then between thin metal plates bent upwards so as to deflect the current upwards. The whole forms a metal box in the wall, and the inner portion can be easily removed for cleansing the interior. There is a ventilator nearly similar to this exhibited by Sharp & Co., but the Stevens's is the best. To be sure, the air will not do all that the patentees assert; it will not rise in so marked a vertical column as from the tube (which, however, is an advantage, though the patentees seem to think it is just the other way), and the air will not "gently warm as it ascends." Air is not so accommodating as that, and people who deal in ventilating machinery ought to know better than to talk such nonsense. The only sense in which the air can be said to "warm as it ascends" in such a case is that it gets mingled with the heated and vitiated air, which it ought not to do until it has been used by the inmates, and therefore it is desirable not to drive it up in colums to the ceiling, but merely to give it a little deflection upwards at entering, which is what this ventilation will do better than the Tobin tube. In fact, the patentees have done injustice to their own article in their indiscreetly-worded prospectus, which claims for the ventilator a power which it does not possess, and which it is the better for not possessing.*

* There is hardly any more absurd kind of literature, when one takes a quantity of it together, than these ventilating prospectuses, in which every man roundly asserts

Another method of introducing cold air, so as to neutralise or reduce draught is that of Mr. Ellison, who introduces air through a conical opening, widening towards the room, so as to disperse the draught. This acts very decidedly in the model shown, and acted upon by a pair of bellows; but we cannot say it is quite conclusive to us against the possibility of a distinctly unpleasant draught through such an opening. Mr. Ellison's "air diffusers," which are to some extent a further application of the same principle, are very serviceable, and have the merit of very neat appearance in a room. We doubt if they are better practically than Stevens's inlet, but they are better in appearance.

Mr. Banner's system of ventilation of sewers by means of an inlet acting in continuation with an outlet is fully illustrated by models, showing the form of the inlet, and the two forms of extract cowl, of which the revolving one is an original invention; the fixed one resembles in principle others that we have referred to. There can be little doubt that this system will keep sewers clear of stagnating unwholesome gases. It is like turning a stream of clean water through a muddy channel, carrying away all impurities with it. One or two other exhibitors show schemes on the same principle which seem to be pretty evidently copied from this one. While speaking of the purification of foul air we may call attention to one device, which is to be seen in another part of the exhibition, in the shape of an "artificial lung," designed for the purification of foul air, especially under such conditions as occur in the Underground railway. This is a kind of large network of tape depending from a tube filled with a solution of caustic soda, with which the net is saturated by capillary attraction, and the alkali in the water absorbs all carbonic acid and sulphur gases as the air passes through the net. The author gives a section of an air-purifying wagon containing a series of these nets, which is supposed to be pushed before each train in the Underground railway, and computes that thus all the air in the tunnels may be kept in a purified and healthy state at the expenditure of about one shilling per train each trip. It would be an interesting experiment to see tried, but we confess to feeling rather sceptical as to the result.

To return to house ventilation. In the class of ventilating systems which are assisted by artificial heat, there is a very original and apparently effective one patented by Mr. Pritchett, already briefly referred to in our pages, and especially designed for hospitals. This consists of a hot plate of two thicknesses of corrugated metal with hot water circulated between them, and which is applied to the wall behind a movable dado, and draws up a current of air behind the wall hangings, which are arranged so as to fall back slightly as louvres, opening upwards, and the warmed air is thus admitted in two or three layers at different heights on the wall; near the ceiling a similar but smaller heated wall-plate acts as an extracting force. The wall-linings in this case are Rees's patent metal tiles, offering a thin movable and washable wall-covering. In the model we can testify that the draught acted admirably, and the same system of corrugated hot-plates is applied by the patentee in one or two other methods of heating. It is a new and apparently a practical and practicable idea. Waller's hospital ventilating apparatus, in which ducts for both hot and cold air are carried along each floor, and can be opened or closed, or hot and cold currents mixed in varying proportions, in the neighbourhood of each patient, sounds very well in description; but will the hot and cold currents, entering the same apartment at the same place, be so obedient to direction as is anticipated? We have some doubt of it. Weeks's admirable hot-water coil, in which air is drawn up through the centre of each column in the coil, has been before commended in our pages, and is one of the simplest and most efficient combinations of warming and ventilation, as far, at least, as inlet is concerned; and it may act as a suitable inlet, in a kind of multiple Tobin-tube form, even for cold air, when the coil is not heated. Messrs. Verity's ventilating and warm-air apparatus, more in the ordinary stove shape, draws up warm air mechanically (by their patent screw-propeller) through a spiral coil of pipe which is heated by a central stove, but which receives the heat through a layer of water so as to avoid the unwholesome effect of air from an overheated metal surface. This also, by means of the propeller, will act as an inlet for cold air when the fire is not lighted.

On the whole, the exhibition shows that we are supplied with several good, and, in some cases, inexpensive, systems of combination of warmth and ventilation, in all of which hot water is the immediate agent for conducting heat. The utilisation of gas for heating purposes is, however, a very important branch of the subject of warming, as, if electricity, as seems very probable, take the place of gas for lighting, there can be little doubt that gas will be largely utilised as a heating agent, a function which it unfortunately fulfils at present, too often, in a way which is not desired. There are two or three comparatively novel ways of utilising this kind of heat which are worth notice for their ingenuity. Mr. Pritchett's "portable air-warmer" is, in the specimen exhibited, warmed by an oil lamp, but would be equally applicable to gas. It is simply a small collection of hollow metal chambers or tubes arranged vertically in a compact circle, and containing water which is heated by the lamp below. There is also an attempt to utilise the spare heat which does not pass into the water, by carrying it down in a descending flue to the level of the floor again, where it finds its way into the room through a strainer, which is supposed to keep back the more noxious products of combustion. This, however, it does not accomplish, as the "smell of the lamp" is very perceptible in the neighbourhood of the return tube, and would by little and little pervade the room. The heat saved is not worth this disadvantage, and the apparatus would be more satisfactory if the flue carried the products of combustion clear away. Ritchie's "Lux-calor" gas stove does profess to provide for this to a certain extent; it burns gas in a closed tube in front of a metal radiator, within which the gases from combustion are condensed and find their way as a liquid into a receiver below. Ventilation tubes for the supply of warmed air also pass up through the apparatus, discharging vertically at the top. The patentees show good testimony as to its innoxious use in green-houses, which is a strong test, but we fear the manipulation of the light would prove some little difficulty to servants. Schönheyder's patent sanitary stove, exhibited by Strode & Co., is a very clever thing, as a combination of light, heat, and ventilation. It is a tall columnar-shaped circular metal stove, with a gasburner about 5 ft. from the floor inclosed in a globe outside the stove. The fresh air rises through the lower part of the stove, passes by a duct through the gas lamp, feeding it and passing off through a flue up the centre of the stove, warming the air in the upper part, which then circulates in the room and is removed by an extract at the floor of the room. This is against our principles, and we doubt the satisfactory working of the extract, in all conditions of the room, but the apparatus does get a great deal of work out of one gas-light, and is very cleverly contrived. It should be understood that the gas and its products are entirely shut off from the atmosphere of the room. A drawback to it is that it is a large and by no means ornamental object in a room, though it might be made more pleasing to sight by decorative treatment. This question of the sightliness or unsightliness of apparatus for warming and ventilation not unfrequently obtrudes itself. Many of them might be much less ugly than they are with proper treatment, but the ideas of manufacturers and patentees on this subject are most original. One patentee tells us his extract-cowls "constitute an architectural ornament." We are much obliged to him, but we respectfully differ. Another, wound up to enthusiasm in the description of his own stove, observes that "the appearance is even more agreeable than the drawing indicates, as it has a handsome brass rim round the projecting part at the top." A handsome brass rim,—think of that! The most exacting "æsthetic" must be content!

Among the appliances for warming only irrespective of ventilation, the grates are mostly such as are known to those interested in such matters, and have been referred to and described in our pages before. Comparing the show of grates here with the immense variety of contrivances for utilising the fireplace in the best or supposed best manner which we met with in M. Planat's large work on heat and ventilation, which was reviewed in our columns some time since (vol. xxxix., pp. 663, 685), we cannot but feel emphatically how little this part of the show comes up to the profession of being "international," and how many suggestions and contrivances have been made in fireplaces of which there is not a hint here. There are Mr. Edwards's grates, which are known to our readers, and which are very good as economical heating grates; there is the "wonderful" grate, the patentee of which, perhaps, claims a little too much for it; there are several reversible grates, contrivances which we think have had their day and the advantages of which are somewhat illusory. Deane's open grate for burning anthracite as well as common coal is a good one; for anthracite there is a special draught created by closing the register door, when the products of combustion are conveyed down side flues and under the fire, and the greater part drawn through the fire again and "consumed"; this until the anthracite has got into a glow, when the register-door is opened and the grate operates in the ordinary manner. As to the working of this special draught on first lighting the anthracite we cannot speak from observation; but we did see anthracite burning in the grate, without smoke, which destroys the erroneous superstition some persons have that anthracite will only burn in a close stove. In fact, anthracite may be burned in a much simpler stove than Deane's. Steven's steam and hot-air heater deserves mention as a very economical and rapid manner of heating a coil (low pressure) to a moderate degree of warmth. The firebrick stove with terra-cotta gills communicating with a hot-air chamber, exhibited by Messrs. Rosser & Russell, shows a great amount of heating-surface for the space it occupies. There are few things, however, that show any speciality of principle worth comment. The grates are mostly more or less satisfactory applications of well-recognised principles, showing in many cases excellent workmanship. Once for all, however, firebrick backs will not last.

FURTHER NOTES AT THE MEDICAL AND SANITARY EXHIBITION.

RESUMING our notice* of the appliances and materials displayed in the International Medical and Sanitary Exhibition, we deal this week with the exhibits in the Eastern Quadrant, taking the stands in numerical order.

At Stand 351, Mr. C. W. Durham, of Chicago, U.S., shows the "Durham system of house drainage," which is described by the exhibitor as an application of the practice of gas and steam engineering to the construction of house drains. Under it, the water-closet system of a building is constructed as a distinct apparatus, independently of walls and floors for its support. A trapless water-closet (of any make) is described as being an essential feature of the system, "securing an uninterrupted flush of water" and "abolishing the disagreeable and indecent trap feature of ordinary plumbing." The full-sized model shown is, we are told, to be taken as a sample of construction only, and not of ventilation. In practice, it is sought to secure a thorough circulation of air through the pipes, which, by the way, are of cast iron with screw joints. The system is stated to have been largely introduced in the Western States, and to have been adopted for all the buildings in "the new manufacturing city of Pullman, Illinois," where two thousand brick dwellings are now in course of erection.

Mr. W. Ramsey (Stand 352) is an exhibitor of Jewell's "improved system of drainage and ventilation," including a double syphon disconnecting trap in stoneware, this trap being arranged with one water-seal above the other. The arrangement is compact, and is worth the attention of visitors. The "Priestley" drinking water tank (Ramsey's patent) is another speciality worth looking at. The cistern or tank is lined entirely with plate glass, and a glass ball-valve is used with it, so that the water stored in the cistern is not in contact with lead or any other metal. The same exhibitor's coloured glass leaded window-blinds are cheap and effective, and most of them fairly well designed. Their non-absorbent nature, and the readiness with which they can be cleaned, are important sanitary advantages.

The capabilities of "Spence's Metal," artistically and industrially, are shown at Stand 354,

* See p. 101, *ante*.

that his ventilator does everything, and no other is of any use at all. This is what Captain Marryat would have called "flap-doodle," which he defined as "the stuff they feed fools with."

where, besides a number of busts, is shown the application of the material for making air-tight joints to iron soil-pipes. The material, as our readers already know, is largely used by gas companies for the joints of their mains.

Mr. F. W. Clark (Stand 355) exhibits in action a portable gas apparatus for lighting and heating purposes. The gas is obtained from a hydrocarbon liquid known as gasoline. The apparatus and its product are well spoken of by architects and others who have used them.

The "Otto Silent Gas Engine," now so well known and so largely in use as to need no fresh commendation, is shown by Messrs. Crossley Brothers, at Stand 357.

Mr. James Wood (Stand 358) shows some handy commodes and disinfecting vessels for the sick room. They are exceedingly light, and their contents can be discharged without offence or risk of contagion by nurses or servants.

Stand 360 is occupied by Messrs. Bellman & Ivey, who have a good display of their scagliola marble, which, apart from its decorative value, is possessed of a non-absorbent and washable surface, and hence its use will be commended by the sanitarian.

Some concrete specialities are shown by Messrs. Charles Drake & Co., at Stand 361. Among them we may mention as specially worthy of notice a "marble concrete" bath, cast in one piece, and polished on the surface. The makers claim for this bath that its material and construction ensure perfect cleanliness, with, at the same time, a pleasing decorative appearance ("Marble concrete," we should say, consists of concrete with small chips of marble embedded in it, so as to give the surface an ornamental effect. It is capable of taking a moderately high polish on the surface). Other exhibits of this firm possessing a sanitary as well as a constructive and decorative value are the "mosaic marble jointless concrete pavement," in one slab 8 ft. by 6 ft., with Grecian scroll and border lines in red, black, and white marble concrete; and mosaic marble hearths, wall-tiles and slabs. The firm also show their method of monolithic concrete building and fireproof flooring. This stand, like many others we have named, merits more than a passing glance.

Concrete in its constructive applications is shown by Mr. Alfred Walker at Stand 362. A speciality of this exhibitor is his "granite and iron slag concrete," which has been largely and successfully used for warehouse and stable floors, railway platforms, footpavements, carriage-drives, &c. Many architects and railway engineers have used these materials, and they have given great satisfaction. The iron slag concrete forms a good fireproof floor by completely encasing with it iron girders and joists. Mr. Walker's concrete sewer culverts, made either in sections with lap joints, or in one piece, are well worthy of notice. At the same stand is shown Phillips's "Reversible Window," which consists of an arrangement of the ordinary window-sashes so as to permit of their being completely cleaned, painted, or repaired, from the inside.

The Eureka Concrete Co. (Stand 363) are exhibitors of warehouse and stable floors, sewer culverts, &c., and of Nichols's patent arrangement for laying gas, water, and other mains so as to prevent roads or pavements being disturbed when such mains require repair or renewal.

The Wortley Fireclay Company (Stand 365) exhibit earthenware pipes fitted with Jackson's air-tight, gas-tight, and water-tight joint, suitable for either sewer or water-pipes. They are also exhibitors of some good glazed bricks, white and coloured, made of Leeds clay.

Mr. T. J. Constantine (Stand 366) exhibits his "hot-air radiating and coal-economising slow combustion 'Treasure' stove," and his "Treasure" cooking-ranges; very good.

At Stand 367 Mr. William Hellier shows his water-heater, for domestic purposes, and the same apparatus in conjunction with a coil for heating purposes. Either gas or hydro-carbon oils can be used for the heater.

The Anthracite Coal Company assert the sanitary value of their smokeless coal at Stand 368.

Stand 372 is occupied by Messrs. Quirk, Barton, & Co., with specimens of their patent tin-lined lead-pipe, for preventing lead-poisoning in water, beer, and other liquids. The thin inner casing of block tin is so firmly united to the interior of the lead pipe that no amount of contortion or twisting appears to have the slightest tendency to separate the two. This piping is drawn complete at one operation by special machinery, the lead and tin being firmly pressed together and united in the process. A useful material exhibited by this firm is their thin laminated sheet lead, for preventing damp coming through walls.

Mr. Joseph Constantine (Stand 374) shows his patent "Convoluted" stove for warming churches, chapels, and other large buildings,—a very good one.

Mr. Robert H. Griffin (Stand 375) shows a register stove designed to be smoke-consuming and to admit fresh warmed air to the apartment in which it is used. It is constructed to burn coal, coke, or anthracite. Some remarkably strong testimonials in its favour have reached us.

Messrs. S. Leoni & Co. (Stand 376) have a number of gas-stoves and kitcheners on view; also hot-plates, ironing-stoves, &c.

At Stand 377 Messrs. Faraday & Son are exhibitors of some very good ventilating and other gas-fittings. By simple means they seek to carry off direct from the burners the deleterious products of combustion.

Dr. P. Hinckes Bird (Stand 378) exhibits his simple and costless means of natural ventilation, first described by him in the *Builder* many years ago. They are unpatented, and any one is free to use them. In many instances their use would be more effectual than that of one-half of the more elaborate contrivances since put forward.

The Silber Light Company (Stand 380) show a number of burners so devised as to get a maximum of illumination whether with gas or oil.

Messrs. Gillow & Co. (Stand 381) are exhibitors of lavatories, specially designed for a limited space, and made of earthenware and walnut.

Mr. C. E. Stevens (Stand 383) exhibits his patent "Steam and Hot-air Heater" for warming buildings. It has many good points to recommend it. A small quantity of water is kept supplied to the copper reservoir above the gas or lamp inside the iron casing, by a supply cistern with a regulating ball-valve, or by a self-acting reservoir with stand, which is connected to the heater by a pipe, and, when lighted, the heat causes the small quantity of water to be turned into steam, which is driven through the pipes, an outlet being provided for the escape of the steam at the top. Stevens's circulating water-heater, for supplying hot water to baths, hand-basins, sinks, &c., is also worth the attention of visitors.

Mr. Thomas Lloyd (384) exhibits a working model of a new patent "shut-up staircase or steps," which may be lowered or raised at pleasure, with the view of gaining or cutting-off access to factories where the precious metals are worked; it would be very useful in many situations. It is the invention of Mr. Ernest Day, architect, Worcester.

At Stand 385, Messrs. Gilmore & Clark show their "Autothermarkon," or self-heat-ruler ventilator, and their "induced-current" air-brick; but their speciality is a recently patented chimney-cap, called the "Scientia," which should be looked at.

Drs. Hayward and Drysdale, of Liverpool (Stand 387), show a large model, illustrating their system of self-acting ventilation by suction power, of which we have before now spoken.

Mr. James Howorth exhibits, at Stand 388, his well-known Archimedean screw and other ventilators, which are favourably known and have been largely used.

Ventilators are also exhibited at Stand 389 by Messrs. C. Kite & Co., who show, among other kinds, a speciality which has been approved by the Metropolitan Board of Works for cow-shed and stable ventilation.

Stand 390 is held by the Universal Ventilating, Sanitary, and Engineering Company, who show Stevens's "Exhaust" and "Drawer-Inlet" ventilators, and Stevens's "Exhaust" chimney-tops. They have all been noticed by us on previous occasions.

Messrs. Comyn, Ching, & Co. (Stand 391) exhibit Thomas Boyle's patent ventilators in various forms. They have been long before the public, and are of proved efficiency.

Bullivant's "air-tight and noiseless" sliding sash-window is exhibited at Stand 392. It appears to be simple and efficient, and has been used by many well-known architects.

The "Anti-Accident" sash, exhibited by Mr. Robert Adams (Stand 395), is somewhat similar in principle to that last mentioned, and is well worthy of notice.

Messrs. Smith & Turner (Stand 397) show Ben Turner's patent adjustable regulating door-spring (largely known and widely used), and other appliances of the kind, including an improved water-bar for French casements. A useful article shown by this firm is Hughes's fountain clothes-washer, which is placed upright in the washing copper or boiler and causes the water to circulate over and through the clothes as long as the water boils.

The "Filtre Rapide," a useful appliance for industrial and domestic purposes, is shown by Mr. P. A. Maignen at Stand 401.

Messrs. Matheson & Gardner (Stand 403) are exhibitors of lead-incased block-tin pipes for water.

Messrs. Benham & Sons (Stand 410) have one of the best and most useful displays in the exhibition. Their "Anglo-German" porcelain stoves are an English improvement on the German porcelain stoves, inasmuch as they are sold complete, ready for fixing, instead of requiring to be built up and fitted together tile by tile, on the spot. The external surface is entirely of glazed enamel. The well-known ventilating globe light, for gas, made by this firm, is shown fitted-up. A disinfecting oven or chamber, heated by gas, and a chamber for the same purpose in which steam is either admitted directly in contact with the articles to be purified, or which is heated by admitting the steam between the jacketed sides of the chamber, are shown. In the one heated by gas, iron plates are provided for spreading the heat, and on these plates sulphur or some other fumigating agent can be used. A hospital ward kitchen-range, with oven, boiler, hot-plate, &c., heated by coal and gas combined, or separately, is likely to be very useful. When the fire has been let out, the gas can be used for the hot-plate. An interesting exhibit is the series of articles of hospital furniture made by this firm for the Evelina Hospital for Sick Children, Southwark. Benham's hospital slop-sink, as used at the Radcliffe Infirmary at Oxford, is worthy of the attention of visitors. Their ventilating kitchener, the "Davey" washing-machine, a centrifugal wringing-machine or "hydro-extractor" for laundries, and Dr. Siemens's improved gas-fire for burning anthracite, are other items in Messrs. Benham's interesting and valuable collection of exhibits.

At Stand 411, Messrs. Chorlton & Dugdale show an exceedingly handy contrivance under the name of the "Sunlight" stove. It is compact and convenient in arrangement, and will cook for a large number of people. By the simple addition of a coil inside the stove, a supply of hot-water for baths, lavatories, &c., can be obtained. The coil can be readily detached at any time, the stove being workable either with or without the hot-water apparatus.

The well-known firm of Musgrave & Co., of Belfast (Stand 412), exhibit their patent slow-combustion stoves and air-warmers, which have undergone several improvements, especially in the mode of feeding. They will burn for from eight to twenty-four hours without attention. Another speciality shown by Messrs. Musgrave is the patent "Ulster" smokeless stove grate. It somewhat resembles a register stove grate, but is provided with a chamber, fed from above the back of the fire, for holding fuel. As the fire burns away, it is replenished by the fuel contained in the chamber, but the fuel so stored cannot become ignited until it reaches its proper position in the fireplace. The heat of the fire causes the fuel contained in the chamber to part with those constituents which form the heavy smoke passing into the chimney every time an ordinary fireplace is fed with fresh coal, but in this stove they are made to pass through the fire and to be consumed. Any coal, and even slack, can be burned in this stove.

Mr. Francis Hammond (Stand 413) shows a ventilating globe gas-light and other gas apparatus.

At Stand 414 Messrs. Weeks & Co. show their excellent "hydro-caloric" coil (which we described and commended not long since), together with their patent "economical boiler," with super-heating tubular furnace-bars, and a vitiated air-extractor applicable to the cornices of rooms.

At Stand 415, Mr. R. Renton Gibbs shows in a very complete way his patent system of heating by means of hot water. His apparatus, in its simplest form, consists of an endless metallic

tube of small diameter, through which there is a rapid circulation of hot water. A portion of the tube is coiled up, so as to surround and contain the fire, and the remainder is disposed in the way most convenient for the attainment of the end desired. Mr. Rentou says that experience has demonstrated to him that only one size of piping is required for all classes of apparatus large or small, and he has found that the most convenient dimension for the pipe is $1\frac{5}{16}$ in. diameter, outside measurement. Mr. Gibbs's system has been largely used by architects and others, apparently with much satisfaction. In Mr. Gibbs's "hot-water grate," a coil of pipe is fitted to an ordinary sitting-room fire-grate, forming a boiler in itself, and yet preserving the cheerful appearance of an open fire. The bars themselves are hollow, and form part of the coil. By means of this grate it is asserted that three or four bedrooms may be warmed from the dining-room or study fire. Mr. Gibbs also exhibits his "air-cleansing prisms," for hospital and other windows. The prisms are in reality merely V-shaped troughs of glass carried horizontally and close above one another across the window opening. Water is admitted from the top of the window into the top trough, whence it passes through a narrow slit in the form of a thin film or sheet into the trough below, and so on until it reaches the bottom of the window, where it finds an outlet. The prisms or glass troughs form a kind of louvre, and the air passing between them when the water is running is cooled and cleansed.

Messrs. Verity Brothers (Stand 416) exhibit in action their patent ventilator or air-propeller, capable of being easily applied wherever there is a cistern, the fans which propel the air being actuated from a fly-wheel which is driven by two pin-hole jets of water. Messrs. Verity also show their patent combined fan and screw exhaust ventilating head, actuated by wind-power. This ventilator has been adopted for the meeting-room of the Royal Institute of British Architects, Conduit-street. The same firm exhibit a patent ventilating and warm-air apparatus, and the "Osborne" combined boiler and coil,—the latter heated by gas.

Messrs. Frederick Edwards & Son (Stand 417) show their "New Smoke-Consuming Slow-Combustion Grate," the invention of Mr. Frederick Edwards, jun. In it Mr. Edwards adopts the principle of putting a body of coals sufficient for a day or a night's consumption into a fire-basket or chamber, making a fire in the common way on the top of the body of coals, and allowing the coal to burn gradually downwards until the whole is consumed. This principle is substantially the same as that adopted in Dr. Arnott's grate, and in the modification known as the "*Builder* Fire." We are told that it also resembles, in some particulars, a grate patented by Mr. Goodchild, an architect of Guildford, in 1857. We have not space to describe it in detail. It should be seen and examined by visitors. By its adoption Mr. Edwards maintains that the following advantages are gained:—(1) A practical immunity from smoke. (2) A fire that will burn from morning till night or from night till morning, with little or no attention. (3) No chimney-sweeping, except, perhaps, once in ten years. (4) No coal-scuttle required except at the time of lighting the fire.

George's patent "Calorigen," in two forms, for coal or gas, is shown by Messrs. J. F. Farwig & Co., at Stand 418. The "Improved Patent Slow Combustion Calorigen," for warming and ventilating, will burn for twelve hours without attention. The improvements embodied in it are important, and calculated to render it increasingly useful.

Stand 419 is occupied by Messrs. R. W. Winfield & Co., who exhibit metallic bedsteads, cots, and furniture applicable for hospital and general use. They have a good display of domestic brass-work, in the shape of fenders, fire-screens, and spark-guards, and a large show of lamps, brass chandeliers, and gasfittings generally.

Messrs. Thomas Potter & Sons show at Stand 420 the "Thermhydric" ventilating hot-water open fire-grate, the invention of Mr. H. Saxon Snell, architect, by whom it has been applied in several of the large parochial and charitable institutions which he has erected in the metropolis and elsewhere. It has on more than one occasion been described by us. Exhibited by the same firm, and devised by the same inventor, is a smoke-consuming revolving fire-grate. It is so constructed that the grate or fire-cage containing the coal or other fuel is made to revolve upon a pivot in such manner that, when fresh fuel is placed upon the top of the fire, it is, by the inversion of the grate or fire-cage, brought undermost, and thus the products of combustion are more perfectly consumed than in the ordinary open fireplace. The working parts are few in number and simple in character.

At Stand 422, Messrs. Hobbs, Hart, & Co. exhibit, besides safes and iron doors for various purposes, numerous specimens of locks, lock furniture, and fittings, adapted for asylums, hospitals, and buildings generally. This firm, as usual, maintains its position.

Messrs. J. L. Bacon & Co. (Stand 423) exhibit their well-known hot-water apparatus, which consists of an endless circuit of wrought-iron tubes of special manufacture, $1\frac{7}{16}$ in. in external diameter, and $\frac{7}{32}$ in. thick, the ends of which are provided with right and left handed screws. They are connected together by means of sockets (also screwed right and left hand), which draw the ends together and force them one into the other, thus making a strong and sound joint. A portion of the circuit of tubing, built into a furnace at the lowest level, supersedes the ordinary boiler. This method of warming is convenient and economical, and hence it has been, and will continue to be, largely adopted.

Several ingenious novelties are shown by Messrs. Archibald Smith & Stevens at Stand 425. First and foremost we must name the "Wonderful" Grate (Russell's patent), which was fully described not long since at a meeting of the Royal Institute of British Architects, as reported in our columns at the time. It is smokeless, and burns anthracite coal, coke, or cinders. It is self-feeding; the fire is always bright; the intensity of the fire can be regulated at pleasure, the fire will burn for twenty-four hours without attention, and it has other advantages which must be seen to be appreciated. The stove is shown in action in the Exhibition. A cheaper form of the stove is made and shown, no doubt quite as effective as the one of which we have been speaking, but not so sightly. This defect in the appearance of the cheaper form of the stove will, it is to be hoped, be remedied. Russell's patent "Binate" door furniture, exhibited by the same firm, is the very embodiment of simplicity in this direction. The pair of knobs are made in one solid piece, and by a very simple and efficient arrangement, are keyed on to the door by the insertion of the lock, so that the lock would have to be taken out of the mortise before the knobs could be removed. The same exhibitors show the patent weather-tight "Janus" fastening for French casements, their anti-friction door-stop, and a weather-tight sill-bar. All these appliances are good and useful, as is the "Janus" adjustable door-spring, with regulator top-centre.

Messrs. Strode & Co. (Stand 426) are exhibitors of sun-burners for gas, and of electrical apparatus for lighting gas. They also exhibit Mackenzie's electric lamp, and their improved gas-regulator. A novelty shown by them is Schönheyder's "Patent Sanitary Stove," which seeks to light, heat, and ventilate a small room at one and the same time. Gas is the heating and lighting medium. Fresh air is drawn in from the outside of the house by a special inlet, and this is warmed by passing through the body of the stove, which is in the form of a pillar, some 5 ft. or 6 ft. high, the argand burner used for lighting the room and for heating the stove branching out some 5 in. or 6 in. from the face of the pillar, into the interior of which the products of combustion are conducted and utilised for heating purposes.

Stand 427 is in the occupation of Messrs. Rosser & Russell, who are exhibitors of a variety of good and useful heating and ventilating apparatus. One of their exhibits is the "Leopold" reversible grate, which will, it is asserted, consume its own smoke, and burn for eight hours without attention.

Messrs. Deane & Co. (Stand 430) are exhibitors of Crane's patent register grate, which we lately noticed somewhat in detail. It is claimed for it that it burns anthracite as easily as ordinary coal, that it effects a great consumption of smoke, and that it thoroughly ventilates the room in which it is used, thus combining the heating powers of the close stove with the healthiness of the open fire-grate.

The exhibitors of the "Radiator" cooking-range (Macphail's patent), shown at Stand 431, claim great things for it.

Messrs. J. Defries & Sons (Stand 433) show their "granulated pumice-carbon filters," in various forms and sizes.

The Sun Auto-Pneumatic Lighting and Heating Company (Stand 436) exhibit their "Sun" gas-making machine,—probably the best apparatus of its kind. It is largely used for churches, mansions, and other buildings which are at a distance from gasworks.

Messrs. Woollams & Co. (Stand 439) are exhibitors of some good wall and ceiling papers, which, being free from arsenical and other poisonous colours, are worthy of notice by sanitarians, and, indeed, by the public generally.

Messrs. Thomas Bradford & Co. (Stand 441) exhibit their well-known washing machinery, now to be found in many large and well-appointed laundries.

Parquet-flooring, impervious to dust or dirt, is shown by the well-known firm of Howard & Son at Stand 442.

We have now made mention of all the principal appliances and materials exhibited in the sanitary section of the exhibition, but before concluding we may call attention to a map exhibited in the Western Gallery (No. 80) by Mr. Henry Newman (late City Surveyor, Winchester) and Mr. S. J. Newman, A.R.I.B.A., Northampton, showing a scheme for providing London and other places in the Thames Valley with a good supply of water. It is proposed to collect the water from the highest portions of the Thames water-shed, where it is believed that a good supply of pure water may be obtained comparatively free from the contaminations and impurities found in surface or river water if taken or collected at low levels. It is proposed to bring the water to London by conduits or tunnels kept at convenient depths below the surface, save in some places where it would come to the surface of the ground, the Northern tunnel terminating at Chipping Barnet Common on the north of London, and the Southern tunnel, between Merstham and Gatton. From reservoirs at each of these points it is proposed that the water should be conveyed in iron pipes to suitable points for connexion with the present mains, so distributing the water by gravitation throughout London and suburbs. In its completed form the scheme would make provision for the supply of water to every place requiring it within the Thames water-shed.

The Exhibition will remain open until the 13th of August; and we urgently recommend our readers to visit it.

BIRMINGHAM AND ITS TRADES.

ONE of Whittier's tenderest poems happily hits off Birmingham. Speaking of Joseph Sturge, he adds that the city of that good Quaker's love was "swinging its clamorous iron flail." Few can visit that great mart, manufactory, and mouthpiece of the Midlands without learning that large as is the opinion that it has of itself and of its value, that opinion is justified; for it is one of the chief of our British wonders. Its name is supposed to tell of the broom that grew plentifully near it in the past. It is claimed that it was an important town before the days of the Romans, to have manufactured arms; as Elihu Burritt puts it, some have believed that they made tools for Cornish miners in the days of the Phœnician traders; that the scythes for the chariots of the ancient Britons were here made; and that the "lineage of its iron and copper workers runs back to Tubal Cain without a break." But in any case, the records of the town from the days of the Conquest to the reign of Charles I. are few. In the Civil War, the people of Birmingham were on the side of the Parliament, and brawls and battles were known in it. In later days, the anniversary of the French Revolution witnessed those riots in which Unitarians and Priestley suffered; and beyond these, till the days of Attwood and of later political leaders, little is known of the great town but its steady growth and the development of its wonderful industries. Peace, law, and order became the motto of Birmingham, and trade has been its ideal.

It is wonderful to look at the town now, remembering what it was forty-five years ago. It had grown from the small town,—with one street "a quarter of a mile long," as Leland describes it,—even then, to one noted for its public spirit and its vast works. The carriageways were generally "formed on Mr. Macadam's principle, but many of the footpaths were uncomfortable, being paved with small stones." The water-works had been recently established; the town-hall, just completed, was "as chaste and magnificent a building as any erected in modern times." The "new market-hall" was completed, and

many of the improvements in Birmingham were in course of being carried out. At that date the municipal concerns were overlooked by one hundred commissioners; the officers of the town were high and low bailiffs, and a chairman of the court leet, whilst two constables and a headborough survived. The first two members of Parliament had just been elected. There were ten churches, many dissenting chapels and other places of worship, whilst the philanthropic institutions were comparatively numerous. The population of the town,—4,000 in 1690, and 73,670 in 1801,—had risen by 1831 to 146,986. It was, in the words of Burke, the "toy-shop of Europe," but, as we shall see, a wonderful one: firearms, buttons, buckles, iron, gold, silver, pens, glass, copper, and brass, were amongst its productions and the materials it worked with. At that day the post-office was at "Bennett's-hill, New-street"; there were nine bankers, six of whom survive now; three newspapers,—all weekly; two gas companies, and a water company. Almost countless numbers of coaches left the Swan and Castle, the Swan, the Albion, the Castle and Saracen, and other inns; columns of carriers fill the pages of the old directories; there were fly-boats and packets by water, but apparently the railway was not, and the directory then runs to seed in a dry list of names of tradesmen and manufacturers in countless industries. There was energy and activity in the town in those days; public spirit of a high order, and a determination to seize on and to make the most of all the advantages that the position of the town or the multiple benefits flowing from the possession of coal and other valuables near it could give it. And it is to that desire, to that public spirit, and to that energy in trade and in corporate matters, that the proud position of Birmingham is now due. Some of the ancient orders of the town have passed away, but newer and more popular bodies have arisen to do corporate service, and watch over and advance with a rare fidelity and devotion the public interests of the growing town. The town of Watt, of Boulton, and of Priestley, has not stood still; indeed, it may be questioned whether the advance has been so great and so continuous generally in the case of any other of the great centres of population. As a great town it is a young one, and hence it has not much to show of the ancient in its buildings, but it has, in place of these, the evidences of public spirit, of wealth, and of abundant taste.

The great town-hall, which has been called the "most symmetrical and classical building in England," with its powerful organ; its fine grammar-school, its colleges, schools, hospitals, stations, and churches, the council-house, and some of the great warehouses and workshops, attract attention, and attest the fact that, of late, Birmingham, whilst regarding utility, has also had an eye to architectural beauty. But it is as a manufacturing place and as a mart that it first claims the notice of the visitor, for it is this that stamps its character primarily upon it. Its trade is great in nuts and nails, in tubes and tins, in tools, pens, bolts, guns, electro-plate, wire, stoves, heating apparatus, bedsteads, and the countless varieties and forms into which iron and steel are shaped. In the days of Hutton it was said that Birmingham was "small in her size, homely in her appearance, and coarse in her dress, her ornaments being of iron from her own forge." It has been greatly changed since that day, but perhaps the greatest of the changes that have been known is that of her industries. It was said a few years ago that the glass trades alone gave employment to 1,500 persons; that buttons claimed the labour of 6,000 more; and that the extent of the gun trade and its labour needs were indicated by the fact that, in three years, there were turned out for the British Government not less than 231,000 stands of arms, and upwards of one million for other powers and persons. Birmingham is not one of the chief centres of the heavy iron trades,—it could scarcely, with its present position, be one of the great producers of pig-iron, for instance, —but in the use of iron and steel, in the production of "toys" of one class or another, and in the production of many of the chief of our daily requisites in steel and iron, it is still the market of the world, and, to some extent, the manufactory also. The two leading firms in the bellows trade, for instance, often send out 500 dozen weekly in the autumn; of one class of axe alone, one maker sends out 2,000 dozen yearly; of iron wood screws the two principal makers can produce 300,000 gross weekly,—an almost incredible number; one firm in the nut and bolt trade employs 3,000 persons; and at one establishment 1,000 cheap clocks have been made in a week. At the Proof House, about half a million barrels are proved in the year; the weekly production of wire birdcages by one firm is a thousand; whilst pens are produced by the great makers at such a rapid rate that they are counted by the million and gross of millions. These figures may be said to be in some degree illustrative of the development of many of the industries in Birmingham; and in galvanised iron, in tinplate, stamped and japanned wares, in almost every manufacture of the metals, from the presents for the "little stranger" to the coffin-plate that records a death,—for every age and for almost all circumstances, Birmingham is the mart if not always the manufactory. It has coal and pig-iron near it; it has manufactures in and all around it; and it has a population which has the inherited skill in manufacturing operations of many centuries, so that it is not to be wondered at that it has attained and still retains greatness, and that it has built up for itself a trade that of its kind has no competitor so great. It is the variety and the extent of its trades that prevents it feeling depression to the same extent that some other towns do, such as Sheffield, for instance, in the periods of dulness in the iron and steel industries. And it is a somewhat singular fact that from that district it obtains some of its raw material, converts it into manufactured goods, and sells the latter at such a price as allows of no competition, even on the part of the town from which it obtains the raw materials it so manipulates.

But Birmingham has a soul above buttons, to use an appropriate simile. Its Town-hall, the Institute near, and the College and the Council House, are proofs of the public spirit it possesses; whilst Aston Hall and its grounds, with other of the public parks, show that the dwellers in the iron town have a longing for more than the mere show of stately buildings; and the investments in lands for the welfare of the people are noble proofs of public spirit rightly applied. And though it is needless to give the figures, yet it cannot be forgotten that the great works of public improvement that have been carried out by the Corporation of Birmingham are works that will for all time stamp with credit the councils that planned and executed them, and the citizens who incurred the cost for the adornment and the general improvement of their town. In that poem of Whittier's, to which we have referred, there is mention made of "the smoky veil" of Birmingham, and though it remains, and is likely yet to remain, there has been something done to render it endurable to those whose circumstances force them to remain "in populous city pent." We have glanced at the growth of the great trades, and it may be said that if the manufacturers of Birmingham are true to themselves there will be further growth. It is true that there is greater competition, and that Birmingham does not hold a monopoly of the manufactures of the world. But it is also true that the uses of iron and steel are growing, and the wants of the people must be supplied by those who produce best and cheapest. It may be that in some parts of the cost of production there can scarcely in Great Britain be a reduction, but in others it is possible. There has been of late an abnormal growth in taxation, both local and imperial, which must be not only checked, but there must be also an immense reduction, so that our manufacturers may be better able to compete with great nations that are becoming manufacturers, and that are not burdened with heavy taxes as in Europe. There must be a readiness also to adapt the style and form of the production to the needs of the user,—even to his whims,—and there must be also a cheapening of the cost of production with an improvement of the quality. With these, and possibly with the reduction of the cost of transit, the position of Birmingham should be improved. The coal and iron near it, the many villages and towns that in the iron and steel trades contribute to its commerce, the hordes of industrious workmen, and the enterprising merchants, should make it a greater town in the future than it is in the present. The sun has not set on our manufactures yet, nor will it if our vast capital and our great labour can be more firmly united to meet that international competition which seems setting in, especially in the metallurgical industries and the metal trades.

DULWICH COLLEGE GALLERY.

IT was but the other day we were conversing with a friend who remembered well the removal in 1814 of the famous collection of pictures which now form the Dulwich Gallery from the house of his neighbour, Mr. Desenfans, in Charlotte-street, Portland-place, where the pictures had reposed for some years in the possession of the Royal Academician, Sir Francis Bourgeois. Desenfans, whose memory is, we imagine, scarcely sufficiently associated in the public mind with the Dulwich Gallery, had collected at the close of the last century a number of pictures for the then king of Poland, Stanislaus. This worthy king, however,—whose character Carlyle, in his "Frederick the Great," has amusingly sketched off in his most summary manner,—did not "come to his own," leaving the collection on the hands of Desenfans. A sale dispersed a large number of the pictures, but the remainder, considerably added to, he left on his death to his wife and his old friend, Sir Francis Bourgeois. It is to Sir Francis Bourgeois that the formation of the Dulwich Gallery is usually attributed, and with justice; the claims of his old friend, Desenfans, and the actor, John Philip Kemble are, however, deserving, as we have already remarked, of more recognition than they generally receive.

Sir Francis Bourgeois, with a wisdom and liberality entitling him to take really the first place in the ranks of the promoters of the fine arts in England, was very desirous to carry out in every point the wishes of his unusually sympathetic friend Desenfans, whose scientific knowledge of art convinced him that without its immediate influence a technical knowledge was unobtainable. To this end he had warmly impressed on Bourgeois the importance of the gallery being retained if possible in London,—in fact, on the very spot in which it had been carefully brought together; but on Sir Francis applying to the then Duke of Portland with a view to the purchase of a reversion in fee of the three houses occupied by him in Charlotte-street, in order that the collection left him by Desenfans might become a permanent exhibition, the Duke did not approve, even if he were certain that he had the power to sell the reversion of his estate in "Marybone," as he writes it in his curt and ill-spelt reply to Sir Francis Bourgeois.* It was at this point that his friend Kemble suggested, with characteristic sympathy for the old Elizabethan actor, Edward Alleyn, that the pictures should be left to the masters and fellows of God's Gift College, Dulwich. Sir Francis, by ample pecuniary bequest, left sufficient to add a wing to the College; the then popular architect, Sir John Soane, the famous architect of the Bank of England, was employed to erect the pleasant gallery with which so many of us are but too little familiar, and which really forms one of the most perfect and charming small collections of pictures in Europe.

Sir Francis Bourgeois died, and, not long after him, Mrs. Desenfans. That lady, in conformity with the wishes and known intentions of both her husband and her old friend, in her will bequeathed the sum of 500*l.* to the Dulwich College for the purpose of fitly entertaining, on their annual visit, the President of the Royal Academy and the Academicians; and, like a practical and worthy housewife, she further desired that "in order that the said annual dinner may be properly and suitably given, I do hereby bequeath the following articles to the Master, &c., of Dulwich College, which I direct shall be preserved by them, and never be used on any other occasion, for any other purpose whatsoever, viz., three dozen of silver plates, with the arms of Noel Joseph Desenfans, esquire, engraved on them; a silver bread-basket, with ditto; four dozen of silver forks engraved with his crest; one dozen of silver spoons ditto; six salt-spoons ditto; a large silver waiter; two small ditto; three dozen of ivory-handled knives, the blades steel and plated; a complete dinner-service of china dishes; a dessert-service of five pieces, with two dozen of plates; a large mahogany dining-table with table-cloth; four plated bottle-stands, with decanters and glasses; a mahogany press with shelves and drawers to be placed in an ante-room containing the above articles." Mrs. Desenfans left in addition a number of pieces of furniture, "a sofa and ten chairs covered with green

* See the correspondence in appendix to the new and excellent catalogue of the Dulwich Gallery.

velvet; two commodes with drawers inlaid with brass and tortoiseshell; two ebony tables with gilt legs"; a French clock, with many other interesting objects immediately connected with the annual dinner, which, for sufficiently good reasons, she wished should be changed from St. Luke's day to the second Saturday in May, or "any other more convenient day of that month in every year." Need we say that the somewhat incongruous pieces of furniture that occupy the last room of the gallery are the same that Mrs. Desenfans specially mentions in her will?

Of the curators, Mr. Denning, who succeeded Mr. Cockburn, is, perhaps, the best known. As an artist his name is familiar to a few sincere lovers of art and the fewer favoured collectors of English works, but above all to the rapidly dying-out band of professors of the great art of the engraver,—artists who have added so many triumphs to the history of English art. To Denning we owe not a few of the famous engravings of modern times.

It is at Dulwich, and especially it was so thirty or forty years since, when people did not go abroad as much as they do now, that the English art-student first becomes acquainted with the charm of Velasquez as a portrait-painter; years ago we believed that at Dulwich we could study at least two Velasquez: we now learn and are correctly informed, as enlarged experience shows us, that the smaller Dulwich Velasquez is but a reduced copy of the original at Madrid; but although this is clearly the case, the comparison with a memory of the original and this copy years ago is exceedingly instructive. From the second picture, a genuine Velasquez, the portrait of Philip IV. of Spain, we are able to form a tolerably perfect judgment of the extraordinary art of that great Spanish painter, whose rapidity and certainty of execution were so wondrous that Sir Joshua himself, in referring to him, said that Velasquez did at once what it took him (Sir Joshua) many hours and many failures to approach.

Notwithstanding that we have pronounced the collection at Dulwich to be one of the most perfect small collections in Europe, its perfection consists in the rarity of specimens of about thirty or so painters, almost entirely belonging to the later schools,—perhaps the only really fine Italian picture being no earlier than that of Paul Veronese, a portion of a work in four parts, all of which, strange to say, are in England, but dispersed in various collections. Admirers of the early Italian art, the admiration for which seems still to be growing as we get a better understanding of the history of art in the period which culminated in so much beauty in Florence during the early years of the fifteenth century, will find but little at Dulwich to study; but at Dulwich are to be seen not only some historical English portraits of the highest importance, but many exquisite Dutch pictures full of instruction and leading to inquiry on the most interesting artistic questions. One of the treasures of the Dulwich Gallery is the "Fête Champêtre," by Watteau, superior, probably, to any of the Watteaus of the Louvre. It is one of those fascinating little compositions of the master in which are gathered together a number of his most graceful male and female figures dressed and grouped with that delicious artistic artificiality that forms the very essence of the painter's Louis Quatorze style, with its charm of sentiment and exquisitely contrasted and harmonising colour. To those even who know foreign collections well, the Dulwich Gallery reserves in this little canvas a true pleasure. Copies, and contemporary copies, are to be found scattered in many collections at home and abroad, but no eye after seeing this Watteau can ever mistake, when met again, the hand of this charming illustrator, almost director, of the coquettish *fêtes* of the French monarchy in its naughtiest days. Not even the brilliant burin of Scotin could render the tone of this most happy of the creations of the painter who, if he had not like the former passed many years in London, we must never forget was a guest for some short time of art-loving Dr. Mead, in his old house in Great Ormond-street.

Notwithstanding the accumulated memories of great pictures and great masters that most of us as we advance in life have now the opportunity of looking back to, the famous Murillos at Dulwich hold precisely the great reputation that they have long possessed, and we look upon them still, after seeing many other Murillos, with the admiration that the work of all great masters seems to secure throughout all changes of fashion or advance of information.

Among the very representative collection of Dutch masters, the admirers of their characteristic art have always found at Dulwich a broad field for study, and though acquaintance with the Continent, and particularly the land of their origin and the wonderful collections it contains of pictures by its painters, affords much startling and pleasant instruction, the Dulwich Gallery cannot be said to cease to offer interest to the lover of Dutch art. One picture, labelled Gerard Dow, a well-known work, is, undoubtedly, in our estimation, not the work of that artist; the catalogue, it is true, expresses a doubt, and suggests the possibility of the painter being the one we should name, and we are almost confirmed in our belief by recognising the lineaments treated in the same broad manner, very unlike Dow's, of the old woman who served as the model in the equally famous picture by Nicholas Maes which hangs in the La Caze collection at the Louvre.

Dulwich Gallery has long shown its portrait by Reynolds of Mrs. Siddons, the familiar portrait in the grandiose action which tradition states was the result of a happy accidental pose of the painter's statuesque model; but among the many replicas of this familiar representation of the great actress the Dulwich copy cannot be said to stand high; if it be by Sir Joshua, it is not a good Sir Joshua, and only in the distance as one enters the gallery does it hold out a promise that a nearer inspection undeceives. In their life-like portraits by Gainsborough, beautiful Mrs. Sheridan and her equally fascinating sister, Mrs. Tickell, beam with all the lady-like animation that the painter ever knew how to breathe into the portraits of his sitters; he was in this case fortunate, indeed, in two such charming models as the Misses Linley, who, till they changed their names, turned the heads of the whole of fashion-haunted Bath of a century ago. Lucky, witty Sheridan romantically bore off the elder of the old Bath musician's daughters,—the original, by the way, of Sir Joshua's "St. Cecilia,"*—and Tickell carried off the younger, and here the two sisters sit and smile, as we hope they will sit and smile for many a generation yet, to tell us what the poet-sung "toasts" of Bath were like in the old coaching days of George III.

In interesting portraits the Dulwich Gallery is indeed by no means deficient,—portraits that each tell, as portraits ever do, their story; few, however, are more worthy attention than the portrait of Molière, "in the school of Lebrun," the new catalogue tells us; it was formerly ascribed (we know not why) to Carlo Maratti, but if of the authorship of the work sage doubts may exist, of the fact that here we have a real portrait of the French Shakspeare there cannot be a suspicion; they are the same unmistakeable features, though a trace younger, as in the famous portrait by Mignard,—the crowned Molière, *bâton* in hand, a portrait which smiles down from the walls of the actor's *foyer* at the Théâtre Français, in company with many another portrayed representation of the great men that have built up the renown of that world-famed theatre. It is one of the justly-prized treasures of the interesting, and to English visitors to Paris almost unknown, museum possessed by the theatre which in French theatrical annals bears the title of "the house of Molière."

Near this portrait of Molière hangs another theatrical portrait, if not of equal interest to the world, at least so to the English visitor, and above all to the Dulwich Gallery,—the portrait of John Philip Kemble, by Sir William Beechey, a painter who, although he appears in our memory to belong to the last century, lived an honoured life in this, and died at an advanced age as late as 1839. This John Philip Kemble is very different to Lawrence's portrait of him as *Hamlet*, which may be seen at Windsor.

The Dulwich Gallery possesses many other interesting historical portraits. Vandyck, or Van Dijck, as Dr. Richter more correctly names him, is represented, though not by any superlative work,—portraits mostly, however, of contemporaries and friends of old Desenfans and Sir Francis Bourgeois, whose names should, in the memory of every visitor to Dulwich, be associated honourably together whenever his thoughts revert to old Alleyn's "God's Gift" College at still happily countrified Dulwich.

* It has a strange effect to the rare English art-students who may find themselves in New York, to come upon in the United States an important picture by Reynolds, but such is the case in the instance of the "St. Cecilia," a picture purchased by Mr. Lenox at the instigation of the late C. R. Leslie, R.A. The picture now in the Lenox Gallery at New York is the "St. Cecilia" for which Mrs. Sheridan sat. It was one of Sir Joshua's unfortunate experiments.

WESTMINSTER ABBEY, JULY 25, 1881.

WESTMINSTER ABBEY lends itself easily to solemn occasions. Within the last very nearly a thousand years, thirty-six coronations have taken place upon its site, but we cannot hastily venture to state the number of memorable funerals that have added to the great history and the dignity of the famous Abbey. It is time, nevertheless, that other steps were taken in this respect.

Westminster Abbey, St. Mark's Venice, the Colosseum, St. Peter's, and the great Pyramid, three Christian and two pagan works, are probably the five most famous buildings in the whole world; but, notwithstanding the greater antiquity of some of them, Westminster Abbey at this moment holds a more prominent place in the regard of the intellectual world than the older buildings. Never, in the long years that have passed since Westminster Abbey has served the great purpose for which it was conceived and erected, never have the custodians of the sad paraphernalia of its funeral ceremonies, been called upon in the exercise of their duty to express or suppress more their heartfelt sorrow than on the occasion of Monday last, when Dean Stanley was buried. Never, probably, has ceremonial been associated with a wider feeling of grief, and never, perhaps, have the funeral obsequies of an eminent man taken place with so few indifferent witnesses, or so many experiencing a personal interest.

We observed a touching incident as we left the crowded Abbey on Monday last,—a poor working-man, waiting outside with a memorial wreath,—a home-made memorial wreath. He was probably a prizeholder in the late window-gardening contest at the *fête* of which the Dean was, perhaps, seen for the last time by the poor of Westminster,—ready when the great folks had passed on to add his mite to the load of honour.

Apart from the many thoughts suggested by the deathbed of the lamented Dean, his last words, as we find them quoted in the sermon delivered on Sunday last at Westminster Abbey by Canon Farrar, are singularly characteristic of the devoted interest that Dean Stanley throughout his years of connexion with the Abbey took in that hallowed spot:—"The end is come," he said, "and it has come in the way I was desirous it should come. I could not have wished it better. I took to my bed just where I wished to die, at Westminster. I am perfectly happy, perfectly satisfied, and I have no misgivings. In spite of every incompetence, I yet humbly trust that I have before the mind of the nation shown the extraordinary value of the Abbey as a religious, liberal, and national institution."

COMPETITIONS.

Bagshot Church.—Complaints and inquiries have reached us as to the management of this competition. The writers say that "in November last the committee advertised for designs, a short time only being allowed architects to prepare their drawings. Notwithstanding, however, the anxiety displayed by the committee to get possession of the designs, seven months elapsed before the unsuccessful competitors had them returned." No information as to the result was given, and they wish to know, naturally enough, whose design has been selected.

Birmingham and Midland Eye Hospital.—An adjourned meeting of the committee of this institution was held on Friday, the 22nd inst., for the purpose of selecting a design for the reconstruction of the hospital. Six sets of drawings had been submitted by the invited competitors. Those under the motto "Mens tuus ego" received the highest number of votes, and the authors, Messrs. Payne & Talbot, of Birmingham, were appointed to carry out the work.

The Royal Exchange. — The Gresham Committee have expressed their willingness to accede to the wishes of merchants, bankers, and others who lately memorialised them on the desirability of covering the Royal Exchange with a glass roof.—*City Press.*

THE TUNNEL AND INSCRIPTION AT SILOAM, JERUSALEM.

THE Committee of the Palestine Exploration Fund are taking much pains to bring before scholars in this country the best materials for forming a judgment as to the rock-cut inscription to which we referred* as discovered in June, 1880, at the Pool of Siloam. In the recent "Quarterly Statement" are given a transcript of this inscription, an alphabet of Aramaic characters, and articles on the subject by the Rev. A. H. Sayce and the Rev. Isaac Taylor. The *Athenæum* of the 16th July contains a letter on the same subject from Mr. Shapira, who has had the advantage over the English scholars of being able to study both the inscription itself and the German cast of the tablet, made by Dr. Gutke, and who, being himself a Jew, and familiar with Aramaic as well as with Hebrew, is likely to feel more thoroughly at home in the matter then even the most learned English scholars.

The comparison, however, of the translations of Mr. Sayce and of Mr. Shapira only tends to confirm us in the wisdom of waiting for fuller light on the subject. We hope that it may prove possible to photograph the tablet by the magnesium light, and that from the cast already taken, the photograph, and the rock itself, the text may at length be accurately determined. At present this cannot be said to be the case. The courtesy of the secretary to the Fund furnished us, some time ago, with a tracing of the first sketch of the inscription that was sent to England. After giving some little time to the study we came to the conclusion that it was necessary to wait for further information. Nor can it be doubted that this was right. The first word in the tracing is "Dereh." The first word in the new copy of the inscription is "Nekebeh." Mr. Sayce commences his translation, "Behold the excavation. Now this is the further side (or the history) of the tunnel." For this Mr. Shapira writes, "Canal of (U) zziah. He dug the canal and cut the pool (or it is the pool) in Ophe (l)."

It is not very encouraging for the unlearned reader, apt, it may be, to have his doubts as to the "science of epigraphy," to contrast these two renderings of some twenty to thirty letters. Contrary to what might have been expected, it is the translation of Mr. Shapira which makes both the best English and the best sense. On the other hand, this translator seems to have a strong disposition to read what is not to be found in the letters. Thus, of the name Uzziah the most characteristic letter is wanting; and so is the *l* of ophel, which Mr. Sayce reads "olu." We certainly hold with Mr. Neubauer, in the *Athenæum* of the 23rd of July, that it is premature to discuss the various readings until the text be definitely settled.

Equally imperfect, we hold, must be any attempt as yet to fix the date of the inscription on palæographic grounds. Mr. Sayce argues for a date of extreme antiquity, in fact, as far back as the reign of Solomon, from the archaic form of some of the letters. But it is admitted that two forms of the same letter occur in the cases of the *aleph*, the *mem*, the *vau*, and the *resh*. Mr. Isaac Taylor, in the "Quarterly Statement," argues reasonably that it is the latest, not the earliest, form of letter occurring in any inscription that should determine its greatest age. One character, which Mr. Neubauer proposes to read as *zain*, is not to be found either on the Moabite stone, on any Hebrew coin, or in the alphabets collected by Gesenius, Mr. Madden, Messrs. Conder's "Handbook to the Bible," or the valuable book, called "Grammatography." It more closely resembles the Hieratic *cheth* (of Ballhorn) than any other character with which we are acquainted. It will be interesting to know on what grounds it is identified, and what light such identification throws on the date of the character. Mr. Shapira, who has studied both the inscription and the cast, says that "we actually find the strangest forms of letters and ligatures, and one letter in different forms." Mr. Neubauer, who has not seen either inscription or cast, "cautions" his readers "against any idea of ligatures between the letters in the Siloam inscription." This question is not, however, one of opinion, but one of fact; and, of course, eye-witness goes for more than assumption. It should not be forgotten that the Aramaic alphabet is one which has not only preserved its type for an immense period of time, but in which early and apparently long disused forms have reappeared at a certainly determined and later date. Thus the letter *shin* has two types,—one that of the small Greek *omega*, the other that of the capital Roman W. The first occurs on the Sidon inscriptions, about B.C. 800, then, slightly altered on some of the coins of about B.C. 277; and then on the Roman *denarii*, re-struck with Jewish types, as late as A.D. 130. The W form occurs on the Diban stone, and again on the coins. We have as yet no minimum date fixed for the use of Aramaic letters, and if ligatures exist on this inscription, it may be better evidence for a later date than any which exists for the era of Solomon, which was a long time ago.

As to the little drift-way itself, it is not a work of such skill as to render it desirable to commemorate the name of the engineer. The position will be seen, by a reference to the map No. 7 in Conder's "Handbook to the Bible," (p. 335) to tally with the work which was executed by Hezekiah (B.C. 717–688). If Mr. Sayce be correct in saying that the length underground is 1,708 ft, although the straight line above is only 1,101 ft., there would seem either to have been much want of skill in the construction, or otherwise that the conduit formed part of a more general plan, of which we have only recovered this portion. Thus, on any ground, it is desirable to investigate the matter fully.

The "Quarterly Statement" which contains the letter from Mr. Sayce and Mr. Taylor is one of unusual interest. We cannot attempt to give an abstract of its contents,—not that it would do any injustice to the work itself, for it would only make the reader more anxious to study the actual report,—but for want of space. Lieutenant Conder's discovery of the Hittite capital, Kadesh, on the Orontes, known from Egyptian records to be older than the Exodus, has excited extraordinary interest. We hope that funds will be forthcoming in order to ascertain whether the library of the Hittite kings may not prove as enduring as those of the kings of Nineveh and of Babylon. The interest in the Holy Land and its vicinity seems to have been stimulated rather than satisfied by the completion of the great map, and the work carried on under the direction of the committee needs only to be widely known in order to insure any requisite amount of pecuniary support. We commend to all our readers the Quarterly Statement of the Palestine Exploration Fund, for July, 1881.

* See *Builder* of April 9, 1881, p. 458.

NEW DOCK AT LEITH.

WHATEVER may be the attractions that give splendour to the occasion of its opening, the new dock at Leith has an intrinsic importance which needs but little knowledge of the case to realise. The basin which will have been opened by the time that these pages are in the hands of our readers, is the second and the larger of two new docks erected on land reclaimed from the sea. The Albert Dock, covering 10¾ acres, was completed in 1869. The Edinburgh Dock, connected with the Albert by a passage crossed by a heavy stone bridge, covers 16½ acres. It is 1,500 ft. long, and 650 ft. wide, but its wharfage, or waterside accommodation, is far more in proportion to its wet area than in other cases. A jetty 1,000 ft. long, and 250 ft. wide, projects into the dock from the eastern end, and the form thus given being something like that of the capital letter H, adds a linear measurement of 2,250 ft. or upwards to the length of wharfage. At the west end of the jetty, within the limits of length and breadth mentioned, is a graving dock 300 ft. long. This is a smaller graving dock than that called after the name of H.R.H. the Prince of Wales in connexion with the Albert Dock, which is 470 ft. long; but it will be an immense convenience for any vessel which, having entered the Edinburgh Dock, has need of the service of a graving dock before putting to sea.

The Edinburgh Dock makes the fifth of the wet docks now in connexion with the port of Leith, two of which are on the west and two on the east side of the harbour. Of these the first, known as the Old Dock, was opened in 1806, so that we have in the present area the measure of the growth of three-fourths of a century. How far the trade has expanded in that time there is a want of statistics to show. Since 1840 the total dues received by the dockyard commissioners have risen from 26,012*l.* to 88,330*l.* per annum. Since 1860 the outward tonnage has risen from 483,748 tons to 945,230 tons, and the inward tonnage from 477,400 tons to 910,200 tons. The actual number of vessels entering the port shows a decrease, but this is due to the increased burden of each vessel, and shows very clearly the great advance that has been made within the last twenty years in the size of our mercantile vessels.

The northern side of the new dock is to be devoted to the colliery traffic, which it is hoped may thus receive a new impetus. The chief exports from Leith at the present time are coal and iron. In both of these, however, the last five years show a notable decline. In 1874-5, 296,193 tons of coal, 147,329 tons of pig-iron, and 1,563 tons of malleable iron, were exported. In 1879-80 the weights had fallen to 185,175 tons of coal, 127,207 tons of pig iron, and 1,821 tons of malleable iron. This is the lowest amount of pig-iron for any year of the five. As to coals, 20,000 tons less were exported in 1878-9 than last year, and the malleable iron was also some 700 tons less. There is thus a small increase in these two items as contrasted with the preceding year, but the decline in the staple export of pig-iron has been steady for the whole period, amounting to nearly 40 per cent. between 1874-5 and 1879-80. Grain, the chief import, has increased, although not steadily. In 1875-6 the imports were 1,074,124 quarters; in 1879-80 1,135,127 quarters. In 1878-9 they were only 939,033 quarters. Most of the coal goes to Russia, and the iron to Germany. In face of this declining trade, the spirit shown by the opening of the new dock is the more striking.

GAS EXPLOSION AT CHALK FARM BRIDGE.

THE account which has been given in the daily press of the circumstances and the cause of the gas explosion at Chalk Farm Bridge, on the morning of the 20th of July, is so incredible, that in reproducing it we must do so under reserve, not having had the opportunity of personal verification. It is stated that in the construction of the bridge hollow box girders were introduced between the roadway and the foot pavements, and that "in spite of the protests made against the proceeding at the time of the construction of the bridge, the gas company, instead of running their pipes under the bridge, or through the hollow girders, made use of one of the latter as a portion of the circuit, turning the gas into it at one end, and drawing it out at the other." It is not stated in the account what gas company it is that adopted so fatal an economy. On reference to the map, it will be seen that the district referred to is that of the Imperial Gas Company, the second in order of magnitude in 1874, and subsequently, if we are not in error, incorporated with the Chartered or Gas Light and Coke Company, the eldest of these bodies, which was incorporated by Act of Parliament in 1810. The public will thus have naturally concluded that every precaution known to science was taken by the engineer of the gasworks. Nor is it conceivable how the engineer of the Regent's Canal, or the officer, whoever he was, that was responsible for the construction of the bridge over the canal, would have allowed a portion of the structure to be turned into a gasholder. In a word, the *pros* are so few, and the *cons* so numerous and weighty, that we write in the full expectation that the detailed statement of the morning journals will be contradicted by the supposed offenders.

But even assuming that a pipe was laid through the girder, the public safety would by no means have been secured, unless there had been a manhole or other means of visiting, testing, and, if necessary, repairing or replacing the pipe. Gas is, to some extent, corrosive in its action, and after a time makes pinholes in, at all events, a certain class of gas-pipes. Again, joints are apt to leak, and when iron is laid on iron, the jar of passing traffic may easily have an accumulative and destructive effect. Any way, it seems that the box-girder was filled with that explosive mixture of coal-gas and atmospheric air, which is so well known to be easily formed if gas is allowed to escape into a closed chamber. As to the exact facts of the occurrence, there seems little room for doubt. The witness and unintentional cause of the explosion, though blown across the road by its force, is said to be, happily, uninjured. This was the lamplighter, who, while cleaning the lamps on the northern pier of the western girder, suddenly perceived a strong smell of gas.

Suspecting a leakage, he proceeded to show that his employers have not taken our advice as to furnishing their servants with a grammar of danger, or a short, clear, explicit set of rules, telling the men what to do and what to avoid in each particular case. Uninstructed on this vital point, the lamplighter proceeded to see whether the mixture was or was not explosive by the simple mode of experiment. Explosive it turned out to be, and before the experimenter could say, "Ha! I thought so," "a terrific series of explosions took place." Happily for those who would otherwise have been the sufferers, the explosion occurred at so early an hour that no one was passing over the bridge. Half an hour later large numbers of workmen would have been passing to their labour. But while this is matter for unfeigned congratulation, as far as the safety of the moment is concerned, it is not so clear that the harmlessness of the occurrence is conducive to the public safety on a broad scale. Had any fatal injury been occasioned,—and it is no thanks to the lamplighter's mode of looking for a leak that it was not,—there would have been an inquest. At such an inquiry it is probable that something rather memorable would have been said as to the plan of turning bridges into gasholders; and at least another opportunity would have been afforded of impressing on those concerned that it is just as prudent to *test* the leakage of a gas-main by the use of a naked light as it is to try whether gunpowder is dry by the application of a bit of red-hot iron. As it is, it is left to us and to a few fellow-labourers to do what we can to call attention to the fact. Meanwhile gasmen will continue to search for leaks with lighted candles until a sufficient number of explosions have thus been caused to impress the explosive nature of gas on the minds of those who deal with it.

From the report of the proceedings of the St. Pancras Board of Works on the 21st July, it appears that the girder was actually used as a gas-pipe. An agreement was produced, which recited that the gas company were to keep the girders in proper repair and gas-tight, and that in the event of failure to do this, the Vestry had the power to put an end to the concession. On the face of this, it would seem that the combination of girder and gas-pipe is a bit of vestry engineering. It will be interesting to know who originated so novel a design, and what are the arguments by which its introduction was supported. The excitement in the neighbourhood, not unnaturally, was reported to be intense, and there is a strong feeling against the continuance of so dangerous a practice. The parish solicitor was consulted. We apprehend that there can be little doubt that the new mode of gas-fitting has received a signal discouragement; still, we are anxious to know who were the authors of the design.

THE TUNNEL UNDER THE MERSEY.

EVEN if ousted, by the marvellous growth of Glasgow, from its former proud position of the second city in Great Britain, Liverpool, in virtue of its 550,000 inhabitants, is still the second city in England. In enterprise and public spirit, moreover, Liverpool has long been held entitled to the boast *nulli secundus*. And as an organised body, or group of bodies, the Town Council and various public authorities of Liverpool have probably more efficiency and intelligence than any other urban authorities in the country, bearing in mind the dislocation existing between city and metropolitan jurisdiction in London, to say nothing of the Conservators of the Thames, the City Commissioners of Sewers, and the various vestries.

Powerful and energetic as Liverpool is, however, it has long been content to be bisected in a very inconvenient mode. In fine weather the trip across the Mersey is not much of an inconvenience, and, indeed, the whiff of salt water thus caught may be welcome to many a hard-driven business man. But weather is not always fine. Days are short in winter. And a steam-ferry over such a river as the Mersey is at times anything but a business-like mode of connecting the docks on either side of the river. What would London say, if some fine morning she should find that her bridges had been replaced in the night by steam-ferries? And the crossing of the Thames is nothing to the crossing of the Mersey.

It is thus remarkable that, although as far back as 1848 proposals were made for a tunnel under the Mersey, it is not until the present time that Liverpool has seriously taken in hand the completion of her organic unity. An agreement has now been entered into by the Mersey Railway Company with the London and North-Western Railway Company for the construction of a line of two miles and a half long that will pass under the Mersey. From a junction with the Birkenhead Joint Railway at Tranmere, the line will run through Birkenhead and under the Mersey, and terminate in Church-street, Liverpool, near the central station of the Midland, Great Northern, and Manchester, Sheffield, and Lincolnshire Railways. That portion which passes under the bed of the Mersey will be about a mile in length, and as far as can be ascertained from a careful series of borings, will be carried through the New Red Sandstone, leaving a sufficient thickness of 25 ft. of rock between the crown of the tunnel and the bed of the river. The works have been contracted for at the sum of 866,000*l.*, of which 216,000*l.* is to be borrowed on debentures. The gross annual receipts are estimated at 140,000*l.* and allowing fifty per cent. for working expenses, the estimated dividend is at the rate of nine per cent. on the share capital of 650,000*l.*

It is estimated that 26,000,000 passengers and 500,000 tons of goods, are annually passed to and fro between Liverpool and Birkenhead. The company have taken credit for half the number of passengers at 2d. each, for the whole quantity of goods at 1s. per ton, and for the modest sum of 6,000*l.* per annum for parcels and sundries. The nearest railway connexion at present is by Runcorn, a distance of thirty miles. We note that while the preliminary report of the census gives to Liverpool 550,000 inhabitants, the account of the railway project gives 681,936 as the population of Liverpool, and 82,216 as that of Birkenhead. We also observe that the *interim* report on the Scotch census only rates Glasgow at 511,582 inhabitants, instead of the 740,000 claimed for that port a few days ago in the newspapers. We must leave the respective authorities to settle this rather serious difference between them.

THE SPANISH ACADEMY OF FINE ARTS, ROME.

ON the 22nd of May, 1875, there arrived at Rome Count Coello, the Spanish representative to Italy, who, having withdrawn himself for some years from diplomatic service on account of a great misfortune, after hesitating for some months before he returned to that career, was led to take that step by his old and proved loyalty to the Spanish royal house, the grateful recollections of a long residence at Turin, and his friendship with Count Cavour and the principal political men of Italy. These recollections, however, were the more necessary in order to fortify himself in the task he was about to undertake, which was of no easy accomplishment, as it was intended to establish important relations between Spain and Italy. The Government of Victor Emmanuel, actuated by a noble sentiment, had been one of the first in Europe to recognise the monarchy of Alfonso XII., although the wound which had been inflicted on Italian pride, and naturally on the royal family of Savoy, but which had been caused by events in which the Alfonso party had had no hand, was still fresh.

On the morning of the 24th May, when Count Coello had scarcely presented his credentials to King Victor Emmanuel, there appeared before him the aged superior of the Society of the Franciscan Order of San Pedro in Montorio, Father Jeremias, informing him that, on the following day, the agents of the commission of church property of the province of Rome were about to take possession of that old church and monastery, which had been appropriated by the Italian government under the law dealing with ecclesiastical property, and urging him to prevent its sale, on account of its intimate connexion with the Spanish monarchy, as shown by the presence on its walls of the arms of the royal Spanish house of Austria, which fact might be used against the proposed disposal, as demonstrating the original ownership of the building. Moreover, there was found at the door of the small church of Bramante a record of the vow made by the Catholic kings who had erected that temple, another incident which supplied strong evidence as to proprietary rights. Count Coello used his influence with the Italian ministry of the day, in so far as to obtain a delay in the sale of the old monastery, and a respite was thus gained for establishing the ownership. The church of Bramante had ever been prized as the site where St. Peter was crucified; and it possessed, besides, great historic value in the eyes of Spain, as being the temple built by the Roman Catholic kings in fulfilment of a supposed vow to erect a church to St. Peter if the Lord would grant a male child to the Spanish royal family, a child who was subsequently born, and who was Prince Don Juan. The walls are covered with the shield of Isabel and Fernando, and the coat of arms of Felipe II. and Carlos V., which occur about fifty times. A diligent search made in archives and old registers by Señor Don Francisco Aguado, the secretary and archivist of Spanish ecclesiastical buildings, showed on what grounds Pope Sixtus IV., in 1472, had granted, at the solicitation of the Catholic kings, to Father Amadeo the site, much more extensive at that time, upon which the edifice of San Pedro in Montorio is raised. The deed still exists by virtue of which Ferdinand the Catholic, yielding to the prayers of Isabella, who was desirous of a male child, fulfilled the vow made by him by supplying funds for erecting not only the church but also the small edifice of Bramante. The inquiries pursued by Señor Aguado also testified to the struggles which the Spanish monastery from its origin had maintained with those of San Pancracio and San Clemente and the Cistercian Order. Many other documents had also to be studied, all of which proved, however, the perfect right of the Spanish crown to the buildings and the site.

The diplomatic negotiations which followed upon the establishment of the Spanish crown as the owner were for a time interrupted in 1876 by the fall of the Conservative ministry; and when the Depretis ministry succeeded it, a satisfactory treaty was arranged, under which the rights of Spain were recognised, while the susceptibilities of the Italian Parliament were reconciled by the proposition of rearing an Academy of Fine Arts for Spanish students on the ruins, the small edifice of Bramante alone being reserved for a Spanish monastery, in which the holding of religious service is to be permitted for ever. We give a view of the new Academy.

MUSEUM, FREE LIBRARY, AND SCHOOL OF ART, STAFFORD.

IN our present issue we give an engraving of the above building erected by the Corporation of Stafford, from designs by Mr. J. B. McCallum, the borough surveyor. The building covers an area of about 225 square yards. The library and reading-room occupy the ground-floor, the first floor being taken up by the "Wragge" Museum, leaving the second floor for the Art and Science Schools. The building is situated in Eastgate-street, and adjoins the Borough Hall, which provides for the entrance, and is connected on the ground and first floor.

The frontage is composed of red brick, with ornamental designs in terra-cotta, supplied from the Brereton Works of Mr. Arthur Gee, of Stafford, the contractor. The work, which includes some scrolls and medallions in terra-cotta, has been completed by Mr. A. Gee, at a cost, exclusive of the site, of 2,000*l.* The heating apparatus was supplied by the Birmingham Sanitary Association.

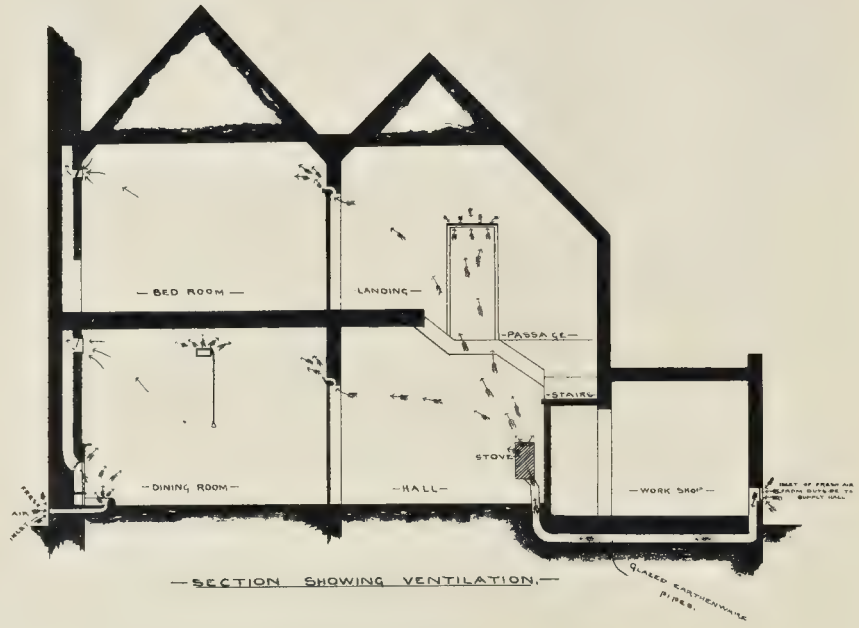
CONGREGATIONAL CHURCH SUNDAY SCHOOLS, BROUGHTON PARK.

THE new Sunday School is being erected at the entrance to Broughton Park from the Bury Old-road, Manchester, and is designed for 300 scholars.

The large room is 55 ft. long by 28 ft. wide, and 30 ft. high to the ceiling. The whole of the rooms will be heated by low-pressure pipes. A heating chamber, a kitchen, and the other offices are provided in the basement.

The building, which is of late Gothic character, is faced with Kerridge parpoints, and dressings of Alderley stone.

The work is being carried out by Messrs. W. Southern & Sons, Salford, from the designs of Mr. A. H. Davies-Colley, architect, Manchester.



The Salters' Company.—Mr. Henry Dawson, F.R.I.B.A., is the successful candidate for the surveyorship of the Salters' Company, in succession to Mr. John Collier, deceased. The election took place on the 21st inst.

ORDINARY VENTILATION.

THE small country-house at Addlestone, Surrey, of which we now give plans and details of ventilation, was built for Mr. John Crowdy (the editor of the *Artist*), from the designs of Mr. Henry G. Brace, 22, Chancery-lane, and embodies points to which both architect and owner have given special attention in connexion with middle-class house architecture.

It exemplifies in plan, as a leading idea, the grouping of the principal rooms round a square hall, which is made an effective internal feature. The staircase is taken into a recess, and treated with a desirable prominence not usual in small houses. Another point is the giving private access to the dining-room from the kitchen department, by a second or serving door.

In the drawing-room is the music recess, by which provision is made for a grand piano and its player. This was a stipulation, we believe, of the owner, and the architect has used it as an opportunity for a pretty effect.

Ventilation is obtained by the cutting of slits in the top of the door-frame, slanting upwards toward the ceiling of the room. These open, in nearly every case, from the hall (a stove in the hall will, when desirable, take the chill off the air), for the supply of every room in the house with fresh air; that is not direct from the outside. The openings are always working, cost but little, and improve the appearance of the top of the door-openings. The reception-rooms are also provided with direct external supply, through Sherringham's ventilator. The vitiated air is drawn into the smoke-flue through a Boyle's ventilator.

It is understood that the currents through the upward slanting slits over the doors result in no draught perceptible to those in the rooms, as the currents entering but at little more than half-way up the height of the rooms and of the width of the door-openings are gently broken up, the air finding its level with the minimum of disturbance.

The external elevation is in red brick, with a very sparing use of stone, and the roofs are of red tiles, while the treatment or style aims at securing a picturesque effect by frankly using modern materials. In the interior much is made in a simple way of the woodwork, especially in and about the hall, staircase, bath-room, and vestibule.

Round the dining-room is a border of tiles; while round the drawing-room and in the bays is parquet-flooring. The morning-room has a wood dado round it, and the floor is of oak. The hall and vestibule are paved with mosaic.

The wall decoration and painting are unobtrusive, but in modern spirit. A treatment of the drawing-room walls and woodwork in two shades of lemon has turned out successful.

SAVAGE ARCHITECTURE.

IN nothing does the savage figure so dimly in an intellectual light as when considered as an architect. Not only is he, in this respect, widely inferior to the civilised man of the lowest grade, but even the beasts of the field, the birds of the air, even flying and creeping insects, seem, in many instances, entitled to claim of him precedence as house-builders. Take the case of the Bushmen of Australia, the Chinook of North America, the stalwart Patagonian, or his opposite neighbour, the elfish Fuegian, and contrast their various abodes with those of the ant, the bee, the beaver, the little harvest-mouse, the magpie, the tailor-bird, the bottle-tit, and a dozen others. Take the magpie's nest, bristling without with such an array of spears and spines that the cunningest of the host of larking and prowling beasts of prey shall pass it by and make no attempt, or assailing it go whining off with a lacerated nose; but while its outside is so impregnable, the most luxurious baby-basket that riches can procure is less cosy and comfortable within; set this by no means excellent specimen of bird architecture side by side with the filthy hole, swarming with vermin, steaming with pestilential exhalations, with no other inlet for fresh air and sunlight than such a doorway as would discredit a rabbit-warren, and with no more durable roof than one composed of green boughs sluttishly arranged. Set the house of the harvest-mouse, round as a ball, and seemingly as solid, but, nevertheless, with snug interior accommodation for half-a-dozen little blind mice,—though whether the house was first built and the baby mice afterwards thrust in, or the tiny things suspended in the air and the house built round them, no naturalist has yet been found daring enough to give a positive opinion, — nobody knows even how mother-mouse gets at her progeny to feed them, as they hang between the solid walls of their spherical mansion to a pliant corn-stalk. Compare this marvel of mechanism with the lairs,—houses they cannot be called,—a mere handful of saplings stuck into the ground in a circle and tied together at the top, and festooned with reeds, and boughs, and grass,—as constructed by the Fuegian and Andamaner. Compare the admirable work of the beaver with the styish abode of the New Guinea savage! The result of contrast in each case will give rise to feelings, not only of profound humiliation, but also of wonder. How is it that the Bushman, with mechanical skill enough to make him spears and bows and arrows, and invention enough to discover and prepare animal and vegetable poisons with which to tip the latter, making a mere scratch with the tiny thing as certain a forerunner of death as a surely-aimed bullet,—how is it that he does not provide himself and his family with at least a warm and dry place of abode? Truly, he has no conception of the comforts of "home," as the term is applied in civilised countries; still, he is human. "If you prick him he bleeds; if you tickle him he laughs"; and if he lies on the damp earth, with the rain trickling through his bough roof, and the wind whistling in at a hundred chinks, he catches cold, and coughs and sneezes, and becomes afflicted with rheumatism and pulmonary disease, him and his children, who drop from the tree of life like blighted apples. Why does not he alter so miserable a condition of things? Why does not he "go to the ant," or any other of God's creatures around him, and learn wisdom?

It should not be inferred, however, that all savages are as heedless of home comfort as the Bushman and the others of whom he has been taken as an example.

There are races of men who, all their works considered rightfully, bear the appellation of savages, yet have the forethought and industry to build them dwelling-places convenient as their means allow, weatherproof and comfortable, and claiming mention in these pages only that they are highly curious. Most prominent among these are the "Guaraons" of South America. Near to the mouth of the vast River Orinoco there resides a tribe of Indians known as the tribe of Guaraons. They are not a numerous people, —the most modern account numbers them at 8,000,—nor are they ever likely to be, as, from motives known only to themselves, they refrain from associating with neighbouring peoples, and have no commerce with the rest of mankind beyond a very limited trading. The Guaraon has little or no need to engage in barter; his wants are confined to wherewithal to satisfy his hunger, to shield him from the inclemency of the weather, and to enable him to float on the water for fishing purposes. All these wants are supplied by a single and wonderful tree,—the Itá palm. This marvellous vegetable production grows to the length of upwards of 100 ft., and its leaves are so large that one, together with the stalk that attaches it to the trunk, is a load for a man; very few of these leaves suffice for the walls and roof of the Guaraon's house. Besides these useful leaves, the Itá bears a prodigious quantity of apple-shaped fruit, enclosed in which is a nut which, bruised and set to ferment in water, yields a delicious beverage, exhilarating and slightly,—very slightly,—intoxicating. If, however, our savage is inclined "to give his mind to drinking," he has but to tap the trunk of the Itá, and it will yield him a wine that, drank but in moderate quantity, renders him as thoroughly "drunk and incapable" as the most inveterate civilised candidate for a station-house lodging could wish to be. Nor is the wonderful Itá yet exhausted. Its trunk is a meal-barrel as well as a wine-cask, and by splitting its trunk and preparing the pith therein contained, he has a dish that in quality nearly approaches anything that could be concocted from the best sago. Not yet even have all the qualities of this palm-tree been enumerated. To quote the words of Captain Reid,—"The trunk can be scooped out into dishes or cut into spoons, ladles, and trenchers. The flower's spathe also gives him cups and saucers. The bows and arrows which he uses are obtained from the tough sinewy petiole of the leaf; so is the harpoon-spear with which he strikes the great manatee, the porpoise, and the alligator; the canoe, light as a cork, which carries him through the intricate channels of the delta, is the hollow trunk; his nets and lines and the clothes which he wears round his loins are all plaited or woven from the young leaflets before they have expanded into the fan-like flower. Such is the Itá palm. Now for its uses,—the uses to which it is put by the Guaraon. When the Guaraon wishes to build himself a habitation, he does not begin by digging a foundation in the earth. In the spongy soil on which he stands that would be absurd. At a few inches below the surface he would reach the water; and he might dig to a vast depth without finding firm ground. But he has no idea of laying a foundation upon the ground, or of building a house there. He knows that in a few weeks the river will be rising; and would overtop his roof, however high he might make it. His foundation, therefore, instead of being laid in the ground, is placed far above it,—just so far that when the inundation is at its height the floor of his dwelling will be a foot or two above it. He is guided by certain marks upon the trunks of palm-trees, notches which he has himself made in the preceding year, or the natural watermark, which he is able to distinguish by certain appearances on the trees. This point once determined, he proceeds to the building of his house. A few trunks are selected, cut down, and then split into beams of sufficient length. Four fine trees, standing in a quadrangle, have already been selected to form the corner-posts. In each of these, just above the watermark, is cut a deep notch with a horizontal base to serve as a rest for the cross-beams that are to form the foundation of the structure. Into these notches the beams are hoisted, by means of ropes, and there securely tied. To reach the point where the platform is to be erected,—sometimes a very high elevation,—ladders are necessary; and these are of native manufacture,—being simply the trunk of a palm-tree, with notches cut in it for the toes of the climber. These afterwards serve as a means of ascending and descending to the surface of the water during the period of its rise and fall. The main timbers having been firmly secured in their places, cross-beams are laid upon them, the latter being either pieces of the split trunks, or, what is usually easier to obtain, the petioles of the great leaves, each of which, as already stated, forms of itself a large beam, 12 ft. in length and from 6 in. to 1 ft. in breadth. These are next secured at both ends by ropes of the palm-fibre. Next comes a layer of palm-leaves, the strong, tough leaflets serving admirably as laths to uphold the coating of mud which is laid thickly over them. The mud is obtained from below without difficulty, and in any quantity required; and when trowelled smooth and dry, which it soon becomes under the hot sun,—constitutes an excellent floor, where a fire may be kindled without danger of burning either the laths or joists underneath. As yet the Guaraon has completed only the floor of his dwelling, but that is his principal labour. He cares not for walls,—neither sides nor gables. There is no cold frosty weather to chill him in his tropical home; no snow to be kept out. The rain alone, usually falling in a vertical direction, has to be guarded against; and from this he secures himself by a second platform of lighter materials, covered with mats, which he has already woven for the purpose, and with palm leaflets, so placed as to cast off the heaviest shower. This also shelters him against the burning sun, an enemy which he dreads even more than the rain. His house is now finished; and, with the exception of the mud floor, is all of the Itá palm,—beams, cross-timbers, laths, and mats. The ropes he has obtained by stripping off the epidermis of the full-grown leaflets, and then twisting it into cordage of any thickness required. For this purpose it is equal to hemp. The mats he has made from the same material; and well does he, or rather his wife,—for this is usually the work of the females,—know how to plait and weave them.

Like other beings, the Guaraon must at times sleep. Where does he stretch his body? On the floor? On a mat? No. He has already provided himself with a more luxurious couch, —the 'rede,' or hammock, which he suspends between two trees; and in this he reclines, not only during the night, but by day, when the sun is too hot to admit of violent exertion. His wife has woven the hammock most ingeniously. She has cut off the column of young leaves that projects about the crown of the

morichi. This she has shaken, until the tender leaflets become detached from each other and fall apart. Each she now strips of its outer covering, a thin ribband-like pellicle of a pale yellow colour, which shrivels up almost like a thread. These she ties into bundles, leaving them to dry awhile; after which she spins them into strings, or, if need be, twists them into larger cords. She then places two horizontal rods or poles about 6 ft. apart, and doubles the string over them some forty or fifty times. This constitutes the woof; and the warp is obtained by cross-strings twisted or tied to each of the longitudinal ones, at intervals of 7 in. or 8 in. A strong cord, made from the epiderm's of the full-grown leaves, is now passed through the loop of all the strings, drawn together at both ends, and the poles are then pulled out. The hammock, being finished and hung up between two trees, provides the naked Indian with a couch, upon which he may repose as luxuriantly as a monarch on his bed of down."

The practice of seeking a home among the boughs, although rare, is not confined to the savages of South America. Stedman makes mention of the same thing as observed by him in Africa, as does Mr. Moffat, who, detailing the curious sight, says, "Having travelled 100 miles five days after leaving Mosega, we came to the first cattle outposts of the Matabele, when we halted by a fine rivulet. My attention was arrested by a tall and gigantic tree standing in a defile leading into an extensive and woody ravine, between a high range of mountains. Seeing some individuals employed on the ground under its shade, and the conical points of what looked like houses in miniature protruding through its evergreen foliage, I proceeded thither, and found that the tree was inhabited by several families of Bakones, the aborigines of the country. I ascended by the notched trunk, and found, to my amazement, no less than seventeen of these aërial abodes, and three others unfinished. On reaching the topmost hut, about 30 ft. from the ground, I entered and sat down. Its only furniture was the hay which covered the floor, a spear, a spoon, and a bowl full of locusts. Not having eaten anything that day, and, from the novelty of my situation, not wishing to return immediately to the wagons, I asked a woman, who sat at the door, with a babe at her breast, permission to eat. This she granted with pleasure, and soon brought me more locusts in a powdered state. Several more females came from the neighbouring roosts, stepping from branch to branch, to see the stranger, who was to them as great a curiosity as the tree-dwellers were to him. I then visited the different abodes, which were on several principal branches. The structure of these houses was very simple. An oblong scaffold, about 7 ft. wide, is formed of straight sticks. On one end of this platform a small cone is formed, also of straight sticks, and thatched with grass. A person can nearly stand upright in it. The diameter of the floor is about 6 ft. The house stands on the end of the oblong, so as to leave a little square space before the door. On the day previous I had passed several villages, some containing houses all built on poles, about 7 ft. or 8 ft. from the ground, in the form of a circle. The ascent and descent is by a knotty branch of a tree placed in front of a house. In the centre of the circle there is always a heap of the bones of the game they have killed. Such were the domiciles of the impoverished thousands of the aborigines of the country, who, having been scattered and robbed by the Moselikatse, had neither herd nor stall, but subsisted on locusts, roots, and the chase. They adopted this mode of architecture to escape the lions which abounded in the country. During the day the families descend to the shade beneath, to dress their daily food. When the inhabitants increased, they supported the augmented weight on the branches by upright sticks; but when lightened of their load, they removed these for firewood."

Let us, however, descend to terra-firma, and take note of how the—well, it matters little where we begin. Polynesia is as good a starting-place as any; let us away there and make inquiry of Mr. Turner how the Samoan builds his house. That gentleman responds willingly and promptly. He bids you imagine a gigantic beehive, 30 ft. in diameter, 100 ft. in circumference, and raised from the ground about 4 ft. by a number of short posts at intervals of 4 ft. all round, and you have a good idea of the appearance of a Samoan house. The spaces between these posts, which may be called open doors and windows all round the house, are shut in at night by roughly-plaited cocoa-nut leaf blinds. During the day the blinds are pulled up, and all the interior exposed to a free current of air; the floor is raised 6 in. or 8 in. with rough stones; then an upper layer of smooth pebbles; then some cocoa-nut leaf mats, and then a layer of finer matting. In the centre of the house there are two or three posts or pillars, 20 ft. high, sunk 3 ft. into the ground, and extending to and supporting the ridge pole; these are the main props of the building. Any Samson pulling them away would bring down the whole house. The space between the rafters is filled up with what they call ribs, namely, the wood of the bread-fruit tree, split up into small pieces, and fastened together so as to form a long rod the thickness of the finger, running from the ridge-pole down to the eaves; all are kept in their places, 1½ in. apart, by cross pieces, made fast with cinnet. . . . . The wood of the bread-fruit tree, of which the greater part of the houses are built, is durable, and, if preserved from wet, will last fifty years. The thatch is also laid on with care and taste; the long dry leaves of the sugar-cane are strung on to pieces of reed, 5 ft. long; they are made fast to the reed by overlapping the one end of the leaf and pinning it with the ribs of the cocoa-nut leaflet, run through from leaf to leaf horizontally. . . . . The great circular roofs are so constructed that they can be lifted bodily off the posts, and removed anywhere, either by land, or by a raft of canoes, but, in removing a house, they generally divide the roof into four parts, with the two sides and the two ends, where there are no particular joints left by the carpenters, which can easily be untied and again fastened. There is not a single nail in the whole building; all is made fast with cinnet. A house, after the novel Samoan fashion, has but one apartment; it is the common parlour, dining-room, &c., by day, and the bedroom of the whole family by night; they do not, however, herd indiscriminately. If you peep into a Samoan house at midnight, you will see five or six low oblong tents pitched, or rather strung up, here and there throughout the house; they are made of native cloth, 5 ft. high, and close all round down to the mat; four or five mats laid loosely, the one on the top of the other, form the bed; the pillow is a piece of thick bamboo, 3 in. in diameter, 3 in. to 5 in. long, and raised 3 in. from the mat by short wooden feet. The sick are indulged with something softer, but the hard bamboo is the invariable pillow of health. The bedding is complete with a single sheet of calico, or native cloth. The fireplace is in about the middle of the house; it is merely a circular hollow, 2 ft. to 3 ft. in diameter, a few inches deep, and lined with clay. The furniture consists of the bed and bedding, a bundle or two of native cloth, a basket, a fan or two, a butcher's knife, a fishing net, a gun strung up along the rafters, a few paddles, a wooden chest in one corner, and a few cocoa-nut shell water-bottles in another; these are about all the things in the shape of furniture or property in a Samoan house.

Being in the neighbourhood, let us cross over to Fiji. We find that the Fijians are remarkable neither for elegance, harmony, nor stability in their habitations, as, says the observant missionary, Williams, in one district a village looks like an assemblage of square wicker baskets; in another, like so many rustic arbours; a third seems a collection of oblong hayricks with holes in the sides; while in a fourth these ricks are conical. By one tribe just enough framework is built to receive the covering for the walls and roof, the inside of the house being an open space. Another tribe introduces long centre-posts, posts half as long to receive the wall-plates, and others still shorter as querterings to strengthen the walls. To these are added tie-beams to resist the outward pressure of the high-pitched rafters, and along the side is a substantial gallery, on which the property is stored. The walls or fences of a house are from 4 ft. to 10 ft. high, and in some cases are hidden on the outside by the thatch being extended to the ground so as to make the tranverse section of the building an equilateral triangle. The walls range in thickness from a single reed to 3 ft. The houses to windward of the island have the advantage in appearance, but those to leeward are the warmest. In the latter quarter patterns are wrought in the walls with cinnet and reeds. A house-builder, master of difficult patterns, is highly valued, and the work of some of them is so artistic and even elegant that it is a pity it is not more durable. Sometimes the reeds within the grass walls are reticulated skilfully with black lines. The fireplaces are sunk 1 ft. below the floor, nearly in the centre of the building, and are surrounded by a curbing of hard wood. Slight houses are run up in an incredibly short time. Williams relates that once when he was at Lakemba he passed a number of men who had just planted the posts of a house 20 ft. long. He was away for about an hour and a half, and on returning found the house finished, excepting the completion of the ridge.

Ordinary grass-houses have no eaves, but there is over the doorway a thick semicircular projection of fern and grass forming a pent. Some houses have openings for windows, and for protection against unwelcome visitors the doorways are made so low that swift and sudden entrance is extremely difficult. For thatching, long grass or leaves of the sugar-cane and stone-palm are used. The latter are folded in rows over a reed and sewn together, so as to be used in lengths of 4 ft. and 6 ft., and make a very durable covering. The leaves of the sugar-cane are also folded over a reed; but this is done on the roof, and cannot be removed, as the other may, without injury. The grass or reed thatch is laid on in rather thin tiers, and fastened down by long rods found ready for use in the mangrove forests, and from 10 ft. to 20 ft. long, and secured to the rafters by split rattans. Some very good houses are covered first with the cane-leaves and then with the grass, forming a double thatch. Sometimes the canes are made 2 ft. thick with ferns, and have a good effect; but when thicker they look heavy, and, by retaining the wet, soon rot.

The ridge of superior buildings receives much attention. The ends of the ridge-pole project for a yard or more beyond the thatch, having the extremities blackened and increasing with a funnel-shape, and decorated with large white shells. The rest of the ridge is finished as a large roll bound with vines, and on this is fixed a thick well-twisted grass cable; another similar cable is passed along the underside of the roll, having hung from it a row of large tassels.

A more animated scene than the thatching of a Fijian house can scarcely be conceived. When a sufficient quantity of material has been collected round the house, the roof of which has been previously covered with a network of reeds, from forty to three hundred men and boys assemble, each being satisfied that he is expected to do some work, and each determined to be very noisy over doing it. The workers within pair with those outside, each tying what another lays on. When all have taken their places and are getting warm, the calls for grass, rods, and lashings, and the answers, all coming from 200 or 300 excited men and boys, with voices of every imaginable key, stamping down the thatch and uttering shrill cries of exultation, produce a miniature Babel, in which the Fijian,—a notorious proficient in nearly every variety of halloo, whoop, and yell,—fairly outdoes himself. "I noticed," observes the gentleman already quoted, "three *bures ni sa*,—strangers' houses or sleeping bures. At least two of the latter are invariably found at every Fijian village or town. They may be compared to our clubs; and those frequented by the chiefs do not seem visited much by the lower orders of people. That at Bau was the largest I saw. All along the sides are sleeping-places, covered with fine mats, and large enough for two men to sleep, and between each there is a fireplace, and stages to put their legs on. Overhead a good supply of firewood is stowed. The centre of the building is covered with loose grass. There are no windows, only low doors, which may be, and always are, closed towards evening by means of thick mats, in order to keep the mosquitoes out. A large kava bowl and bamboo vessels filled with spring water seem to be the only utensils admitted. In buildings or bures like these, all the male population, married and unmarried, sleep. The boys, until they have come of age, erect a bure of their own, often built on raised stages over the water, and approachable only by a narrow trunk of a tree. The women and girls sleep at home, and it is quite against Fijian etiquette for a husband to take a night's repose anywhere except at one of the public bures of his town or village, though he will go to his family soon after dawn. In the daytime the bures are generally deserted. Towards four o'clock the people begin to pour in; and if any strangers arrive, they will invariably take up their quarters at these places. Here politics and all events of the day are discussed, and when talking the men,—even

high chiefs,—will be plaiting cocoa-nut fibre into cinnet, so much used in the construction of houses, canoes, and arms. And a great deal these people have to talk about: the politics of the groups, independent of the new element introduced by the cession of the country to England; the never-ending intrigues of the Tonguese immigration; the endeavour of missionaries, consuls, and traders to spread Christianity and civilisation, are rather complicated, and give rise to a good deal of discussion and speculation. When evening is coming on and the bure is beginning to fill, most of the fires between the sleeping-places are lit, and the natives are leisurely stretched on the mats, their legs cocked up on the stages like those of Yankees in a tavern, and all smoking their cigarettes,—made of self-grown tobacco and dry banana leaves. Now come the kava-chewers,—comely-looking youngsters,—carrying the large wooden bowl, a cocoa-nut shell for drinking the beverage, the bamboo water-vessel, a handful of fibre for straining the kava, and the root of the South Sea pepper from which it is prepared. No sooner have they taken their seats and commenced chewing, taking care to throw the rope affixed to the kava-bowl towards the person highest in rank, than a leading man, perhaps a heathen priest, begins chanting a song in which the whole assembly joins, and two young fellows beat time with little sticks applied on a bamboo or any other sounding wood that happens to be handy. The leader of the chant does not sit motionless, but waves his body, arms, and hands in such a variety of ways and with such extreme ease, that you fancy you can imitate him as readily as the whole assembly does; but the very first time you fail, to the great delight of your native spectators. His motions are not difficult, but you never know what they are going to be until it is too late to imitate, and he has already passed on to something else. The interest of this by-play is thus kept up, and the Fijians deserve full credit for having obtained hold of one of the great secrets of fixing the attention on an object, or making it, in other words, interesting. They know the art of concealing the end as long as possible. What would novelists do without the use of this machinery! How dull would life itself be if the future was unveiled to us. The lads having chewed a sufficient quantity of the root, place the masticated mass into the bowl. Now water is poured on the whole yellowish-looking fluid, strained through fibres, and a cup filled. Whilst the cup-bearer is holding it to hand to the chief, or highest personage present, an old man gives the toast, the cup is emptied in one draught, and thrown by the drinker on the mat to be filled again, and handed to the next in rank, until the whole assembly has been served. The song becomes less and less hearty, and conversation slackens, and one by one the men drop off to sleep. Strange sight. Their pillows are made of a thick stick, have four legs, and are put just under the neck, so that the hair of the sleepers may not be disarranged,—they having had it recently newly done up, washed with lime to make it frizzed like that of negroes, dyed in various colours, and arranged in many different ways. Several days must have been spent to get some of these extraordinary heads dressed. And for this reason,—no other,—they are ready to sleep all their lives on a pillow made of a stick of wood, and so constructed that a European could not rest his neck five minutes upon it without suffering dreadful pain."

Turning to Borneo, and to Mr. St. John as a guide, we travel to the village of Tungong, on the banks of the river Lundu. Here we find the curious spectacle of one building serving for almost the entire population. Tungong is enclosed by a slight stockade, and within this defence there is one enormous house for the whole population, and three or four small huts. The exterior of the defence between it and the river is occupied by sheds for prahus, and at each extremity are one or two houses belonging to Malay residents. The common habitation, as rude as it is enormous, measures 594 ft. in length, and the front room, or street, is the entire length of the building, and 21 ft. broad. The back part is divided by mat partitions into the private apartments of the various families, and of these there are forty-five separate doors leading from the public apartment. The widowers and unmarried men occupy the public room, as only those with wives are entitled to the advantages of separate rooms. The floor of this edifice is raised 12 ft. from the ground, and the means of ascent is by the trunk of a tree with notches cut in it,—a most difficult, steep, and awkward ladder. In front is a terrace, 50 ft. broad, running partially along the front of the building, formed, like the floors, of split bamboo. This platform, as well as the front room, besides the regular inhabitants, is the resort of pigs, dogs, birds, monkeys, and fowls, and presents a glorious scene of confusion and bustle. Here the ordinary occupations of domestic labour are carried on,—paddy ground, mats made, &c. There were 200 men, women, and children counted in the room, and in front, whilst we were there in the middle of the day, and, allowing for those abroad and those in their own rooms, the whole community cannot be reckoned at less than four hundred souls. Over head, about 7 ft. high, is a second crazy story, on which they stow their stores of food and their implements of labour and war. Along the large room are hung many cots, 4 ft. long, formed of the hollow trunks of trees cut in half, which answer the purpose of seats by day and beds by night. The Sibuowan Dyaks are a wild-looking but apparently quiet and inoffensive people. The apartment of their chief is situated nearly in the centre of the building, and is larger than any other. "Some thirty skulls were hanging from the roof of the apartment," continues Mr. St. John, "and I was informed that they had many more in their possession, all, however, the heads of enemies, chiefly of the tribe of Sarebus. On inquiry I was told that it is indispensably necessary a young man should procure a skull before he gets married. When I urged on them that the custom would be more honoured in the breach than in the observance, they replied that it was established from time immemorial, and could not be dispensed with. Subsequently, however, the chief allowed that heads were very very difficult to obtain now, and a young man might sometimes get married by giving presents to his lady-love's parents. At all times they warmly denied ever obtaining any heads but those of their enemies, adding, they were very bad people, and deserved to die. I asked a young unmarried man whether he would be obliged to get a head before he could obtain a wife. He replied, 'Yes.' 'When would he get one?'—'Soon.' 'Where would he go to get one?'—'To the Sarebus river.' I mention these particulars in detail, as I think, had their practice extended to taking the head of any defenceless traveller, or any Malay surprised in his dwelling or boat, I should have wormed the secret out of them."

Let us now initiate the reader into some of the mysteries of the interior of the ordinary habitation of the Abyssinian, with its clay walls and conical thatch.

The "arat" is the couch or bed on which all town Abyssinians sleep, that it to say, all those who can afford such a luxury. It is a solid framework of wood on four legs. A fresh, raw hide is cut into strips, and these are stretched over the frame in and out—one crossing the other—about an inch or rather more apart. The whole tightens in drying, and forms a rather hard, but very agreeable cool bed. It is the custom always to sleep naked, but covered with the quarrie or cotton-cloth worn in the daytime, and the only bedding used is a piece of native tanned leather, so that the air has free access from below. In these hot climates, however, it is more usual to sleep out of doors, the arat inside the house being used for cold or wet weather only, or for receiving visitors in the daytime. The "midele"—a sort of fixed couch built of stone and plaster fixed against the wall of an inner chamber—in like manner is covered with a piece of red leather, unless it happens that some wealthy dame has a carpet of Egyptian or Turkish manufacture. The pillows are mostly of wood, either a square block about 4 in. long by 3 in. broad, a little hollowed on one side for the head, or sometimes very tastefully shaped, the stand being neatly turned like a candlestick bottom. It is about 7 in. or 8 in. high, and the part on which the head rests is crescent-shaped. Some of the latter are made of ivory, and stained with henna. This form of pillow is very necessary to people who, from the custom of having their hair fancifully dressed and arranged, and plastered with butter, could not lay their heads on any ordinary one, as they would saturate it with grease, besides seriously disarranging their coiffure, so they use the hollow wooden pillow, just laying their ear on it, and allowing their hair to hang freely behind. It is rather fatiguing at first to be obliged to keep one's head for a whole night in one position, and that, indeed, not the most comfortable; but habit reconciles one to almost anything. The floor is carpeted with grass, which, in the first instance, is spread nearly 6 in. deep all over the room, and afterwards, whenever a visitor comes, a little fresh grass is politely strewed for him to sit on, so that in course of time it accumulates to a considerable quantity. Now this is one of the most disagreeable customs in the country, for, as before and after meals, and on other occasions, the hands of every person in the room are washed by a servant pouring water on them out of a drinking-horn, or any other utensil he may have at hand, you are obliged, from the want of a basin to receive the water, to scratch a small hole in the grass to prevent it splashing you. Add to this the beer and liquids spilt there every day, the manure left by the mules' feet in passing to and fro from the stable, and the cleaning out of the stable itself, which is done two or three times a week for the sake of the mules' feet, which would otherwise become softened by remaining in the wet. This last operation makes a great deal of dirt, for, having no buckets, they carry out the manure and filth in any sort of basket, gourd, or dish they can lay their hands on, dropping, of course, a good deal on the way. This carpet of grass becomes in time nothing less than a manure heap in a high state of fermentation or putrefaction. Its surface, from the continual supply, keeps an appearance of freshness; but though the eye may be deceived for a time, the nose cannot be, and the smell becoming intolerable, the whole is obliged to be cleaned out. For at least a day after this operation the house must be left to ventilate, otherwise no one could live in it. Dirty as this practice is, we cannot much complain of it in the Abyssinians, as the old English custom of strewing the room with rushes entailed consequences that would probably nowadays seem quite as disgusting. Let us now take a survey of the kitchen. Imagine a small room about 10 ft. long, 6 ft. broad, and 8 ft. high, with or without a window, according to circumstances, but more usually without one, and at all events without a chimney, so that the smoke, which is always kept going, and that vigorously, finds the door the nearest exit, and it may be easily conceived that the atmosphere is so dense as to render it difficult for any one but a native to remain long in the room. Even the cook-women, who pass the greater part of the day in this smoke, never think of standing up to do their work, but always remain squatted as low as possible, either near the door or fire. Every article the room contains becomes, like the apartment itself, of a pure soot black. The kitchen utensils are, the "magogo," or oven, if it may be so called; a few jars of different forms and sizes, according to the use they are intended to be put to,—some with long necks and narrow mouths, for keeping water in; others with wide mouths and no necks at all, for holding the liquid dough of which the bread is formed; and the earthen dishes or saucers in which the meat and other eatables are prepared and served up. The "magogo" is an oblong building, 3 ft. by 4 ft., and about 1 ft. high. It is constructed of clay and small stones, with a place in the centre for a fire. The whole is covered with a circular slab of a sort of pottery-work, being nearly the same material as that of which the dishes are formed, nicely polished on the upper surface, which is slightly concave, in order to receive more easily the liquid dough for the bread. At the back is a hole by which the smoke may escape, and in front a sort of doorway, by which the fire is lighted, and which, being placed exactly opposite the kitchen door, has always a draught of air to keep up a good fire. The cover is made of clay, and is used to keep out the smoke and dirt, and to retain the heat.

We shall next speak of the habitations of the people of the Soudan.

New Brighton.—The new (R. C.) Church of St. Peter and St. Paul, built on a site in Rowson-street and Hope-street, has been opened. The church, in which accommodation is provided for from 350 to 400 persons, is arranged with a nave and gallery, while at the east end are the chancel, a transept, and a sacristy. Early English is the style of architecture, which has been adhered to by the architect, Mr. Edmund Kirby. Mr. William Owen, of Liverpool, was the contractor.

ARCHITECTURE, AND ITS POPULAR STUDY.

IT has been asserted that architecture is distinguished by reason of its being the least popular of the fine arts. That such an assertion is founded on truth is the daily experience of most practitioners.

Every man of average education deems himself a connoisseur on the subjects of painting, sculpture, music, and poetry, yet architecture seldom evokes intelligent criticism, even from those fairly conversant on art topics generally. The popular appreciation for architecture would appear to go no farther than the acquisition of the necessary knowledge to distinguish the Italian from the Gothic building. It is an every-day question put to architects when submitting their designs, "What style do you call that?"

That misconception, not to say ignorance, largely prevails amongst the educated classes as to the general principles of architectural art was clearly shown by a recent review in the *Builder*. That an art in which all are directly interested,—the productions of which are forced upon the sight equally with those of nature,—should be so little understood, appears at first sight somewhat unaccountable. All persons are to some extent susceptible to the influence of sweet harmonies, the rhapsodies of the poet, and the glowing canvas, whilst architecture in its more refined phases is to them as an unknown language, a sealed book, a blank page. To the majority, architecture is a huge, sensuous reality, appealing to their visive organs by reason of its solidity and magnitude. It fails to awaken the pleasures of association or imagination, or to excite their interest by the intellectual impress ever present in architectural works. They are not roused by the halo of historical events inseparably connected with architecture, neither do they appreciate what Addison terms "that greatness of manner in architecture which has such force upon the imagination, that a small building where it appears shall give the mind nobler ideas than one twenty times the bulk where the manner is ordinary or little." Superficial observers are apt to admire and wonder at the pyramids, whilst failing to discover cause for admiration in the Parthenon. What impresses them is the element of *bigness*; the subtler beauties of architecture remain undiscovered. How many thousands daily pass the New Law Courts, seize upon their magnitude, and ejaculate "Fine building"! How insignificantly small the number of those who can grasp something more than bulk,—the very soul of the building,—the petrified thought! This indifference and inaptitude may be accounted for in some degree by the fact that, whereas music, painting, and poetry, are in a measure understood, and excite pleasurable emotions without demanding special knowledge of harmony, the technicalities of painting, or the rules of versification, architecture requires for its proper appreciation special study and an acquired taste. When sought this knowledge is of easy attainment, and such is the pleasure derived from its acquisition that, as Addison truly observes,—"A man having a taste for architecture is as one possessed with another sense compared with the man who has no such taste." Many reasons could be advanced showing the desirability for making the study of architecture a popular recreation, equally with the other branches of fine art, chief amongst which is its practical utility,—its great claims to being regarded as one of the most intellectual pursuits, inseparably connected as it is with the world's history, being in many instances the only remaining record of events long since passed. The study of practical architectural principles would enable all to exercise judgment and taste in the selection of their dwellings; it would afford means of ascertaining what is good or bad in construction, what required in altering, repairing, or fitting up, and what appropriate in decorating or furnishing.

All men, it is true, do not build houses, yet all men live in them; consequently a knowledge of such constructive arrangements as will contribute to comfort and convenience, and such an acquaintance with the distribution of parts as will enhance the elegance of their dwelling, ought not to be a matter of indifference to any man or woman.

Had we not cognition to the contrary, it would be only reasonable to assume that the peculiar conditions under which we live would foster the popular study of architecture, for it is characteristic of modern art that, contrary to the usual practice of the ancients, its greatest efforts are discernible in private mansions of every size and degree. This is a distinguishing feature in the practice of architecture in our own time as compared with that of prior civilisations. In former times the utmost beauty and embellishment of which architecture was capable were lavished upon public buildings, whereas the introduction of architectural pretensions into private dwellings was the exception and not the rule. To a great extent a system the reverse of this now prevails. There does not, as in ancient times, exist a popular appreciation for architecture which will sanction without murmur that lavish expenditure upon national edifices which is requisite to the production of really noble and artistic buildings. The nobleman and merchant prince will freely invest his means in an ostentatious dwelling-house for his own use, whilst failing to subscribe according to his wealth towards the erection and embellishment of local or national edifices.

If we were to argue from analogy we might be tempted to assert that architecture as an art was in a state of retrogression; for on an examination of past history we find that the popular appreciation for architecture was in inverse proportion to the elegance of private dwellings; hence, "in those ages when the grandest and most beautiful temples were erecting in Greece, the most sumptuous palaces in Italy, and the magnificent cathedrals in England, there is no evidence of much improvement having been introduced into the private dwellings even of the wealthy." To those who occupy what are called "good houses," either in town or country, a knowledge of architecture would tend to enhance the desirableness of their possession, whilst at the same time being a source of practical value to them. Its acquisition is a mark of refinement, and the "open sesame" to a vast store of intellectual enjoyment. Turn in whatever direction we please, architecture in some phase meets the eye. It can be studied in all climes, all places, and at all times. Its enjoyment demands no expense and comparatively little fatigue. Its beauties are the property of the impecunious equally with the rich; for beauty is the property of no man; it belongs to him who can *see it*. It has been truly observed by one of England's greatest writers that a taste for architecture gives a man "a kind of property in everything he sees," whilst he will frequently experience greater satisfaction in contemplating an edifice than its actual possessor. Being an art which appeals to the reason equally with the imagination, the beauties or deformities in architectural works are easily rendered obvious to the most ordinary understanding. Great and desirable results might be hoped for from the more popular study of architecture. Our towns would be projected with greater regard for convenience and comfort. Houses would be erected on sound sanitary principles, and display some degree of taste in their design and arrangements, whilst public edifices might be justly celebrated for their more than usual architectural elegance. "Jerry-builders" and "cheap-jack speculators" would soon become extinct. Miles of verdant fields would then give place to something more worthy our boasted intelligence and pre-eminence than vulgar vernacular villas. It is rarely that architecture has the opportunity for benefiting by the intelligent criticism of those outside the ranks of its professors. This, however, would no longer be the case were the study of this art once made popular. Whilst anxious to see architecture popularised, it is not our intention to make every man an architect; for we cannot countenance the "every-man-his-own-doctor" principle, but simply to create in the minds of the populace an intelligent appreciation for the best artistic work; to cherish a national feeling of respect founded on admiration, without which, as Ruskin says, "a great school of architecture cannot exist." Architecture embraces so much that it is difficult to define clearly where is the beginning and where the end. Equal pleasure and profit may be derived from its study by the philosopher, scientist, historian, poet, painter, priest, or layman. The art is universal; co-eval with man, providing his shelter whilst living, his tomb when dead. It has been observed that no institution can be established without its aid. "It gives to art its gallery, to science its museum, to literature its library, to education its colleges, to benevolence its asylums, to religion its temples." It is frequently alluded to in sacred writings, and all the sciences are more or less laid under tribute in the erection of even some of the least remarkable buildings: chemistry in the composition of materials; geology in the selection of sites and building materials; conic sections and geometry in setting out the domical roof, the noble Gothic vault, or elaborate tracery; statics in general structural stability, counterpoising the thrust of arches or resisting downward pressures; dynamics when opposing bodies in motion; optics when studying general æsthetic refinements: acoustics when arranging buildings for public discourse or musical entertainment; physiology and the laws generally pertaining to health, in the planning of dwelling-houses; law, in its relation to the construction of buildings, the preparation of contracts and agreements, the subject of ancient lights, easements, boundaries, party structures, dilapidations, fixtures, and titles. That the professor of an art embracing so much should accumulate a vast store of miscellaneous information is absolutely imperative, and it is equally essential that he keep himself "abreast of the times" as regards artistic, scientific, and sanitary knowledge. If not a philosopher, he must cultivate a philosophical temperament; for probably no other professors are so frequently opposed and thwarted in their legitimate aspirations by monied vulgarity or unlettered ignorance. He must be a man of refinement, business tact, and withal, courteous; for has he not to propound his ideas to his noble patron; direct their practical execution by the artisan, and frequently reconcile conflicting opinions and opposed interests? Notwithstanding the numerous claims which architecture has upon the attention of all cultivated minds, yet its unpopularity has resulted in the architect being looked upon by thousands of fairly intelligent people as a "man who draws."

This is all the more to be regretted, seeing that it requires but a mere superficial examination as to the true position of architecture to discover what an essential part it performs in our every-day life, and also the many points of view from which it may be studied. Architecture provides the noblest frame-work for painting and sculpture. The greatest painters, sculptors, workers in mosaic and precious stones, have deemed it an honour to aid in the embellishment of the architect's creations, and the landscape gardener has put forth his best efforts to beautify the "stately homes of England,"—

> "Embosom'd high in tufted trees."

An architect has the noble privilege of improving nature. The abbeys, castles, mansions, villages, spires, forges, mills, bridges, scattered amongst the hills and valleys, enhance the beauties of nature and give contrast and animation to the scene. Many of these buildings are rich in historical association,—others but of yesterday for future generations to gaze upon and admire. A halo of sacred mysteriousness surrounds the many venerable piles:—

> "The lonely turret, shatter'd and outworn,
> Stands venerably proud,—too proud to mourn
> Its long-lost grandeur."

Might we not truly say of many of the ruined abbeys of England and their delightful surroundings,—

> "It is a spot under these northern skies
> Beautiful as a wreck of Paradise."

The popular study of architecture would tend greatly to augment the pleasure of travellers and tourists. In the works of architecture there is an exhaustless, never-ending variety. From the most northern Gothic pile to the rock-cut temples of India, how wonderful is the display of human industry! We have here the impress upon matter of a thousand generations; their intellectual seals; their gorgeous epitaphs! What, we may ask, are countries without their architecture? Is it not for this that we visit Egypt, India, Greece, and Normandy? What more impressive than the ruins of Karnack, Luxor, Thebes? What more fanciful or gorgeous than the Courts of the Alhambra? What are the attractions in Rome, Venice, and Athens? Are not the Colosseum, St. Peter's, St. Mark's, the Pantheon, St. Sophia, the Parthenon, and many of our own cathedrals, poems in stone, histories in themselves? A celebrated French writer speaks in rapturous terms of St. Peter's, as clothing the idea of God in all the splendour of which it is capable; and our own Macaulay, writing of the same building, says,—"In I went, and I was, for a moment, fairly stunned by the magnificence and harmony of the interior. I

never in my life saw, and never, I suppose, shall again see, anything so astonishingly beautiful. I really could have cried with pleasure. I rambled about for half an hour or more, paying little or no attention to details, but enjoying the effect of the sublime whole." Many similar impressions have been chronicled, yet how many of those who visit the cathedrals of York, Westminster, Ely, Salisbury, Milan, Antwerp, Cologne, Constantinople, and a thousand other places, fail to thoroughly appreciate the many beauties, both of design and construction, or can dwell on the charms of historical association, for lack of a little previous study?

Architecture is a favourite theme with the poet, many of his figurative expressions being borrowed from its vocabulary, whilst it is for ever linked with the greatest names in history. Kings, statesmen, philosophers and poets have obtained lasting fame by reason of their connexion with and patronage of architecture.

Such is the pleasure to be derived from the study and contemplation of the glories of this art that every man and woman who professes cultivated taste should regard a knowledge of architecture as "no honour to have it, but a dishonour not to have it." There exists around this study a peculiar charm apart from any theories of art. As an archæological study it constitutes one of the most fascinating inquiries; for whether we trace its progress through ancient or modern times, it is so intimately connected with all that is remarkable in the world's history that a knowledge of it will give equal pleasure, and its acquisition be as profitable to the mind, as a smattering of two or three dead languages. We trust that what we have advanced in favour of the more popular study of architecture will prompt non-professional readers to devote a small portion of their leisure to acquiring the rudimentary principles of an art which "embraces all that is beautiful," whilst at the same time it can awaken emotions and pleasing memories within the breast of the learned and unlearned, the rich and the poor, the king and the cottager, presenting as it does in innumerable instances veritable "sermons in stone."

J. G. B.

"SPENCER, SPARE THAT TREE."

As was noticed in these columns not long since, much opposition has been expressed to the proposal for removing from before the old entrance to the South Kensington Museum the superb plane-tree with its encircling seat, that for so long has been a familiar feature to all visitors to that wonderful institution. Since the new entrance to the Museum has been opened, the old tree has been sadly neglected, and now, of the thousands of visitors who pass through the busy turnstiles, only a few of those who recall the commencement of the museum probably ever bestow a glance on the old tree whose existence is threatened. It is sincerely to be hoped that it will be spared. Though our metropolis is so green, it can ill afford to lose so characteristic an adornment, and we trust the authorities of the Science and Art Department will do their best to preserve it.

The old plane-tree is something more than a mere tree; it is, like, indeed, most of the older trees of the metropolis, a landmark. The tree was once part of Old Brompton Park, which will be found marked on the maps of some forty or so years since. Almost under the shadow of its branches stands the now almost ruined lodge in the secluded private garden of the museum on the left of the new entrance. Even at this moment the old place shows strong remains of its past beauty. On this ruin, for such it has become, may be seen a tablet stating in enamelled letters that in the house had resided "Benjamin Franklin, artist [*sic*], philosopher, and statesman."

EASTBOURNE SANITARY EXHIBITION.

THE arrangements for this exhibition, we hear, are progressing satisfactorily, and a successful result is expected. Lectures will be delivered by Dr. Alfred Carpenter, on the evening of the opening day,—Monday; on Tuesday by Professor Robert Kerr; on Wednesday by Mr. E. C. Robins; on Thursday by Mr. George Wallis; on Friday by Mr. E. W. C. F. Schmidt; and on Saturday by Mr. I. Skone. The afternoon lectures will be delivered by Mrs. Johnstone, of Hastings, Mr. Mardon Mowbray, Mr. F. G. Cooke, and others.

FROM FOREIGN SERIALS.

ITALY.

Le Journal d'Italie (July 7).—Amongst the exhibits at the Milan Exhibition, which are referred to in this number, is the class for cremating apparatus. Many various systems are represented; those of Polli and Clericetti, Venini and Poma, Betti and Teruzzi, and Guidini.——Amongst the numerous anatomical preparations exhibited are some specimens prepared by Dr. Efesio Marini, of Naples. By means of a process which is not described, he has succeeded in converting human remains into a substance as hard and durable as marble, whilst retaining their colour and texture. He exhibits as a specimen a mosaic bowl, composed of fragments of various portions of the human body.

GERMANY.

Dingler's Polytechnisches Journal (July).—The two numbers for the present month contain an abstract of the papers read at the general meeting of the Society of German Cement Manufacturers. It is too long for us to give more than the titles of the various papers. These are: "The Influence of the various Degrees of Fineness in the binding power of Cement," by Mr. Somei, who also gave an account of new apparatus for grinding and screening cement; "The Scientific Drying of the Materials," by A. Bernoully, who described the various furnaces and stoves for the purpose. The question of the best system for testing cement and for the preparation of the briquettes, was the subject of a discussion, in which a number of speakers took part. The subject will be resumed next month, when we may recur to it.

FRANCE.

Revue Industrielle (July 20).—The Société Technique de l'Industrie du Gaz has announced that the following premiums will be given in connexion with the industry which it represents:—4,000 francs to be distributed amongst the authors of the best papers presented at the meeting in 1882; 2,000 francs to be divided amongst the introducers of the most important improvements in gas-lighting; 250 francs for each of the best papers presented to the meeting of the present year; 500 francs (given by the Lyons Gas Company) for the best system of heating by gas; 200 francs to the foreman or workman showing the longest service in a gas-works.

This number of the *Revue* contains illustrations of a new surveying instrument, called the topographical square, invented by M. A. Penesau. It is composed of a metal mirror whose plane makes an angle of 45° with the line of vision, and having a thread down its median line. It is fixed on a gun-barrel, which also carries a sight, and has below the mirror a weight of lead and wood, kept in its place by a spring, and released by pulling a trigger. The object of the apparatus is to find the perpendicular of any given spot. A pole having been previously fixed on the place whose perpendicular is required, the operator holds the instrument like a gun, looks through the sight, adjusts the "square" in the direction of the pole, and walks on until it is reflected exactly upon the thread which marks the middle of the mirror. As the line of vision passes through the eyehole of the sight to this median thread, and as the mirror is at an angle of 45° to the line of vision, so soon as the image of the pole falls upon the median thread, the foot of the perpendicular has been reached. The operator touches the spring, and the weight falls to the ground and marks the spot.

THE LATE DEAN STANLEY.

SIR,—I have been reading the report which you (alone, I think) published more than three years ago (*i.e.*, in April, 1878) of the interesting and eloquent funeral sermon preached by the late Dean Stanley on the occasion of the death of Sir Gilbert Scott. In that sermon occur these words:—

"We cannot forget him. Roof and wall, chapter-house and cloister, the tombs of the dead and the worship of the living,—all speak of him to those who know that his hand and his eye were everywhere amongst us."

How truly applicable are the words of the preacher to the preacher himself! The whole sermon is well worth reading, and possesses a melancholy interest at this time. L.

HEALTH AND ART QUESTIONS: SOCIAL SCIENCE ASSOCIATION.

THE following are the special questions in the two departments most interesting to the majority of our readers to be discussed at the Dublin Congress, October 3rd to 8th:—

Health Department.—1. Is it desirable that hospitals should be placed under State supervision? 2. Is it (*a*) desirable that there should be a system of compulsory notification of infectious diseases, and, if so (*b*), what is the best method of carrying such a system into effect, and (*c*) what is the best method of enforcing the isolation of cases of infectious disease? 3. Is any further legislation desirable in order to more effectually prevent the overcrowding of dwelling-houses.

Art Department.—1. What should be the condition of copyright as regards music, painting, sculpture, and the fine arts generally, considered in relation to the Bill introduced into the House of Commons? 2. What should be the relations of painting and sculpture to architecture? 3. What is the influence of the annual exhibitions of contemporary pictures and sculpture on art and public taste?

ARCHITECTURAL AND SANITARY EXHIBITION AT INVERNESS.

IT is intended to open a museum of architectural, building, and sanitary appliances in Inverness, in August next.

Inverness, the capital of the Highlands, and the business-centre of a very extensive district, is considerably removed from manufacturing towns, and the architects and builders have difficulty in bringing before their clients examples of articles specified or wanted, and recourse has to be had to catalogues and lists, which, at the best, convey but a faint idea of the reality, or samples have to be sent for, entailing considerable delay and inconvenience. An exhibition, therefore, of such articles as are constantly wanted in the building and other allied trades cannot fail to prove beneficial alike to exhibitors and to the public.

Intending exhibitors should apply at once for space to Mr. Daniel Warren, the secretary.

SMOKE ABATEMENT.

ON Tuesday afternoon a meeting was held at Grosvenor House for the purpose of receiving a report from the committee appointed at a previous meeting of the National Health and Kyrle Societies, to consider the steps which should be taken towards abating the mischief occasioned, especially in large towns, by smoke. The chair was taken by Mr. Ernest Hart, and amongst those present were the Princess Louise, Marquis of Headfort, Sir Algernon and Lady Borthwick, the Hon. Rollo Russell, Lord Thurlow, Admiral Sir Spencer Robinson, Dr. C. W. Siemens, the Earl of Dartrey, Mr. S. Morley, M.P., Mr. G. Cubitt, Mr. A. T. Amherst, M.P., Lady Hobhouse, Earl of Carysfort, Lord Arthur Russell, M.P., Professor Abel, &c.

Mr. W. Coles (honorary secretary) read the report of the committee, which stated that in view of the increasing size of towns and the injury to health resulting from the excess of smoke, the objects the society had in view were considered to be of the greatest importance, and called for public support.

Dr. Siemens moved "That the present smoky atmosphere of London injuriously affects the health and happiness of the community, besides destroying public buildings and deteriorating perishable fabrics, and entailing in various ways unnecessary expenditure." As long as twenty years ago he had directed his attention to the subject of economising fuel, and subsequently to that of consuming smoke. It was evident that smoke was the result of imperfect combustion, and imperfect combustion was caused by the irregular supply of fuel to the grate. Gaseous heat, he contended, was double that of coal heat, given the same proportions of fuel used. It was true, however, that at present gas cost more than double the amount that ordinary fuel cost. The difficulty could, however, be overcome by the gas companies if they would separate their illuminating from their heat-supplying gas, and sell the latter at a low price. By a combination of coke and gas a fire representing as nearly as possible an ordinary coal fire, without, however, having any smoke, could be secured.

Sir H. Thompson seconded the motion; and

Dr. Quain said he entirely agreed with the views expressed by Dr. Siemens, and hoped he would not rest from his labours until those views were practically carried out.

The motion having been carried, the following resolutions were also adopted:—"That this meeting approves of the action of the Smoke Abatement Committee of the National Health and Kyrle Societies, in promoting the exhibitions and trials of improved heating and smoke preventing appliances, to be opened at South Kensington in October next." "That this meeting will support the efforts now being made to reduce the evil arising from coal-smoke, and will assist in raising the funds necessary for completely carrying out on a practical scale competitive testing of the various appliances to be shown at South Kensington, and for providing the funds necessary for suitable prizes, medals, &c."

PATENT RECORD.*

APPLICATIONS FOR LETTERS PATENT.

3,000. G. Crawford, Port Glasgow. Self-closing taps, &c., and apparatus for checking waste of water. July 8, 1881.

3,002. J. Griffiths, Weobley. Apparatus for purifying smoke. July 8, 1881.

3,020. H. Howitt, Ilford. Sash bar for horticultural buildings. July 9, 1881.

3,037. J. Gooddy, Wombwell. Securing the joints of earthenware and other piping. July 11, 1881.

3,055. C. M. Scott, Dalkey. Disinfecting apparatus. July 12, 1881.

3,067. J. Gilmore, Lower Norwood, and W. R. Clark, Peckham. Apparatus for accelerating an outward draught from chimneys, &c. July 13, 1881.

3,079. J. Cornforth and E. T. Burton, Birmingham. Open fire-grates. July 14, 1881.

3,081. W. Dawes, W. H. Thompson, and D. Thompson, Leeds. Water-closets and urinals. July 14, 1881.

NOTICES TO PROCEED

have been given by the following applicants, on the dates named.

July 12, 1881.

1,859. T. C. Fawcett, Leeds. Brickmaking machinery. April 29, 1881.

2,743. H. H. Lake, Southampton-buildings. Construction of Pavements. (Com. by D. McLean, New York, U.S.A.) June 22, 1881.

July 15, 1881.

1,033. G. Hunter, Leeds. Apparatus for consuming smoke in furnaces or fire-places. March 10, 1881.

1,038. W. R. Lake, Southampton-buildings. Water-closet apparatus. (Com. by A. Edwards, Philadelphia, U.S.A.) March 10, 1881.

1,380. W. E. Crowther, Manchester. Ornamental screens for fire-places. March 29, 1881.

1,815. H. Sutcliffe & W. Sutcliffe, Halifax. Moulding of water-closet cisterns. April 27, 1881.

2,636. G. J. Cox, Maidstone. Gas cooking and heating stoves. June 16, 1881.

2,793. J. L. Seymour, New-cross. Venetian blinds. June 25, 1881.

2,813. E. Lee, Leeds. Producing designs on tiles, glass, &c. June 27, 1881.

ABRIDGMENTS OF SPECIFICATIONS

Published during the Week ending July 16, 1881.

4,990. J. Bruce, Birmingham. Apparatus for opening, closing, and fastening casements, sashes, &c.

These are hung on pivots. A lever has a fixed fulcrum at its lower end, and the upper end has a stud which fits into a slotted hole in the upper corner of the sash. The lever, at some point intermediate of its length, is connected by a link to a rod which is laid down and connected to a hand lever, by which it is actuated. Nov. 30, 1880. Price 6d.

4,997. W. Morgan Brown, Southampton-buildings. Making doorways, &c., close and tight.

The frames are made with the corners rounded off and without the usual rabbet or stop, but, instead, a smooth bevelled seat extending all round. The door is also round cornered with a continuous bevelled edge, which is grooved to receive a packing of india-rubber or other material. (Com. by G. B. Thompson, Pitston, U.S.A.) Dec. 1, 1880. Price 10d.

5,078. S. H. Adams, Leeds. Apparatus for flushing drains.

A small syphon is placed within a larger one, so as quickly to withdraw the air therefrom and bring it into action. A small hole is made in the larger syphon above the point at which the liquid is drawn off, so as to make the action intermittent. (*Pro. Pro.*) Dec. 6, 1880. Price 2d.

5,099. W. Stead, Northallerton. Meters, &c.

These are applicable for both liquids and gases. Feathering discs are mounted in pairs on axles passing through a central shaft, and enclosed in a casing, which has an expanded acting channel, which the disc entirely fills up for half the revolution, when it comes to a contracted return channel, by which it is automatically flattened, at the same time opening the opposite disc. Dec. 7, 1880. Price 6d.

5,112. W. Wildig, Chester. Flushing apparatus for closets and drains.

A circular drum is made to revolve on a pipe, and is placed in a tank. The liquid being supplied to the drum it turns over and discharges its contents. (*Pro. Pro.*) Dec. 8, 1880. Price 2d.

5,116. R. Schloesser, Manchester. Water-meters, &c.

A circular shallow vessel has a central vertical spindle on which are six horizontal arms, three of which carry wings which exactly fill the passage through which the water flows. The passage has a partition on one side, so that the water is forced to take one direction. The other three arms exactly fill the space over the top of the partition, so that they form stops between the inlet and outlet passages. The wings are hung loosely on the arms so that they can pass over the partition also. The revolving spindle is attached to the usual counting gear. (Com. by MM. Dreyer, Rosenkranz, & Droop, Hanover.) Dec. 8, 1880. Price 6.

5,126. J. A. Mays, Great Winchester-street. Valves, &c.

A collapsible diaphragm is used in conjunction with a ball-valve, to close the aperture for the passage of the water when the ball-sinks. (*Pro. Pro.*) Dec. 8, 1880. Price 2d.

5,201. B. C. Cross, Dewsbury. Trough water-closets.

This is an improvement on Patent No. 2,324 of 1878 in that the urine is conveyed away by a separate channel, and fills the small tank which controls the syphon, instead of water as previously claimed. (*Pro. Pro.*) Dec. 11, 1880. Price 2d.

* Compiled by Hart & Co., Patent Agents, 28, New Bridge-street, E.C.

ARCHITECTS' BENEVOLENT SOCIETY.

A SPECIAL general meeting of contributors to the Architects' Benevolent Society was held on Tuesday afternoon last in the Council Room of the Royal Institute of British Architects, Conduit-street, to confirm the new edition of the by-laws, as revised at the annual meeting held in March last. The President, Mr. John Whichcord, was in the chair, and there were present Mr. G. J. J. Mair, Mr. Ewan Christian, Professor Hayter Lewis, Mr. Henry Currey, Mr. J. H. Good, Mr. H. L. Florence, Mr. E. l'Anson, Mr. Matt. Wyatt, and Mr. W. H. White, hon. sec.

The minutes of the annual general meeting having been read and confirmed, it was resolved that the by-laws, as revised, be adopted. Most of the alterations which have been made in them are consequent on administrative changes which were felt to be desirable when the society passed under the *ægis* of the Institute. These changes have been effected with the view of securing efficiency combined with economy of administration.

We may perhaps usefully call the attention of our readers to the concluding words of the report of the Council presented at the last annual meeting:—

"The total income of the Society, from subscriptions, barely exceeds 300*l*. The number of contributors during the past year is less than 250, and these are to a large extent recruited from the Institute. Yet, though the professional members of that body now number nearly 800, only 140 Fellows and Associates contributed to the Society's funds during 1880. Considering the increasing numbers entering the profession, and the many practising architects in the populous cities of the United Kingdom and Ireland, the Council trust it will not be in vain to earnestly impress on contributors the necessity of obtaining additional subscribers and donors, remembering that all who run a race cannot win; that distress, disease, and affliction may overtake the most prosperous, and compel many a professional brother, his widow and children, to seek assistance from the Society to alleviate the sad consequences of such reverses."

THE BUILDERS' BENEVOLENT INSTITUTION.

THE thirty-fourth annual meeting of this Institution was held at Willis's Rooms, King-street, St. James's, on Thursday last, Mr. Thomas F. Rider, president, in the chair.

The report, read by the secretary, Major Bratton, reviewed the affairs of the Institution during the past year, and congratulated the subscribers and donors on the result, which had been most gratifying, owing to the energy and liberality of the president. While feeling extremely grateful for the liberal donations received, the committee urge the necessity of obtaining new annual subscribers, and hope that the present subscribers will take every opportunity of bringing the Institution under the notice of those who do not as yet subscribe. The annual ball, as usual, was in every way a success, rendered so by the energetic honorary secretary, Mr. F. W. Keeble, who was supported by an efficient number of stewards, and to whom the committee offer their grateful thanks. The committee also express their thanks to the "Thalian" Amateur Dramatic Company, for the very excellent performance they were kind enough to give at the Imperial Theatre in May last, in aid of the funds of the Institution, and especially to Mr. Douglas Fourdrinier for originating and carrying out the entertainment, which was so successful both financially and as a dramatic performance. Nine pensioners have been elected during the past year, and eight have died.

The balance-sheet, audited by Messrs. J. H. Hunter, J. Crattenden, and R. J. Ward, shows that 1,632*l*. 19s. 8d. was paid to pensioners during the year, besides 38*l*. paid as burial money. The balance brought forward from last year was 788*l*. 1s. 4d. The annual subscriptions amounted to 810*l*. 2s. 6d., and the donations to 977*l*. 4s. 6d. The profit on the annual ball was 54*l*. 7s. 11d., and the profit on the theatrical performance was 102*l*. 6s. The dividends on invested fund amounted to 643*l*. 2s. 8d., and there remained a balance of 1,349*l*. 15s. 4d. at the bankers'.

The report and balance-sheet having been adopted, it was resolved, on the motion of the chairman, seconded by Mr. Plucknett, to alter Rule II. by omitting the words, in sections 1 and 6, "for each candidate to be elected."

A vote of thanks was passed (on the motion of Mr. Plucknett, seconded by Mr. Thomas Stirling) to Mr. Rider for his services as president during the past year; and votes of thanks were also given to the vice-presidents, trustees, treasurer, auditors, and committee. Mr. Plucknett was re-elected treasurer, and Mr. Keeble was desired to again act as hon. sec. for the ball. It was unanimously resolved that George Burt, E.q., J.P., ex-sheriff of London and Middlesex, and a member of the firm of J. Mowlem & Co., be elected President of the Institution for the ensuing year; and it was announced that the annual dinner will be held at the Freemasons' Tavern on the 3rd of November.

NEW BATHS AT LONGTON, STAFFORDSHIRE.

THE Longton Public Baths, erected by the municipality, have been completed and opened.

The first-class swimming-bath leads out of the corridor facing the hall. The dimensions of this bath are 70 ft. by 40 ft.; the depth at the shallow end 3 ft. 4 in., shelving down to 6 ft. 4 in. at the deep end, giving an average depth of 3 ft. 9½ in. The floor of the bath is laid with white glazed bricks, interspersed with blue diving lines. The water is supplied to this and to all the other baths from the main of the Staffordshire Waterworks Company. The bath contains, when full, upwards of 60,000 gallons of water. At the shallow end of the bath, to the right of the entrance, is fixed a copper "spray pipe," by which a spray of water may be projected over a considerable portion of the bath. This is with the view of aërating the surface of the water, so as to keep the bath fresh and cool for a long time, besides serving as a shower-bath for the bathers. There are twenty-four dressing-boxes, twelve on either side, surmounted by a substantial gallery for spectators. In the second-class swimming-bath, which adjoins the one just described, the arrangements are, in the most essential points, similar to those of the first-class bath. The dimensions are 55 ft. 6 in. by 30 ft., the depth being from 3 ft. 3 in. to 5 ft. 6 in. The floor and sides are cemented in place of the white glazed bricks of the other bath. The capacity is about 48,000 gallons.

The portion of the baths devoted to ladies is approached through the hall nearest the clock-tower. The fittings and arrangements are the same in every respect as those of the other divisions. There is at the extreme end of the corridor, to the left of the entrance-hall, a plunge-bath. There are two first-class private warm baths (fitted with showers), and one vapour bath. The second-class division contains four

warm baths. There is also a dressing-room in the basement of the clock-tower adjoining the plunging bath.

The engineering arrangements consist of two steam boilers,—each 16 ft. by 5 ft.,—which supply the heating power for the swimming-baths, the supply of hot water for the private and vapour baths, and also steam for driving the very complete steam laundry, which is on the ground floor above the boilers. The washing-machines used are Bradford's "Vowels." In the laundry is fixed Bradford's improved water-heater. This is supplied with steam from the boilers, which passes through a copper coil: the condensed water after entering the waste is returned direct into the boilers. The heating of the swimming-baths is accomplished by means of "live" steam injected into the water of the baths direct from the boilers. This has been found, after considerable experiment, to be the most economical way of heating baths. In proof of this an experiment was carried out the other day by Mr. Arden Hardwicke, the borough engineer, when the second-class swimming-bath was heated from a temperature of 53 deg. to 75 deg. in two hours and a half, and with a very small consumption of fuel.

The whole of the building has been designed by the borough engineer, Mr. Arden Hardwicke, Assoc.-Mem. Inst. C.E., and the work has been executed under his immediate supervision. The contractors for the building are Messrs. H. & R. Inskip, of Longton. The boilers, machinery, and engineering work, including the plant in the laundry, have been produced by Messrs. Thomas Bradford & Co., of Manchester, under the personal superintendence of Mr. Alfred Giles. The plumbing work is being executed by Mr. G. H. Plant, of Longton; and the whole of the gas arrangements are by the Corporation's gas department. The estimated cost of the whole of the building, including fixtures, &c., is 8,000*l.*

SOCIAL.

RESPONDING to a hearty invitation from Mr and Mrs. I'Anson, the President and Council of the Royal Institute of British Architects paid them a visit on the 22nd inst. at their country residence, Grayshott Park, Hants. Mr. I'Anson is one of the original members of the Institute, and many of his brother members of the council were glad of the opportunity of showing their regard for him. A pleasant journey through a pretty country, a *déjeûner à la fourchette*, and a ramble through the somewhat extensive grounds, with their bright piece of water, sufficed to fill up all the time at their disposal.

The party included Mr. G. E. Street, R.A., the president; Professor Hayter Lewis, V.P.; Mr. Ewan Christian, V.P.; Mr. Charles Barry, past president; Mr. F. C. Penrose, M.A.; Mr. A. Blomfield, M.A.; Mr. David Brandon, F.S.A.; Mr. Jas. Brooks, Mr. Arthur Cates, Mr. Clarke, Mr. W. White, F.S.A.; Mr. Macvicar Anderson, Mr. Henry Currey, Mr. John Gibson, Mr. C. Hansard, Mr. E. B. I'Anson, Mr. A. Waterhouse, A.R.A.; Mr. E. Woodthorpe, a near neighbour; and Mr. William H. White. Sir Frederick Leighton, P.R.A.; Mr. Salvin, and some few other private friends of the host and hostess, as well as some few members of the Council, were kept away by previous engagements.

Although strictly a private visit, we fancy this brief record of a pleasant outing will not displease any who were concerned.

MR. JAMES ALLANSON PICTON, ARCHITECT.

WE hear with the sincerest pleasure that a letter has been received from Mr. Gladstone announcing that the Queen has been pleased to confer the honour of knighthood on Mr. James Allanson Picton, author of the "Memorials of Liverpool," and for over thirty years a member of the Liverpool Corporation. Mr. Picton took a prominent part in public life as the founder and director of the Liverpool Free Library and Museum, and on the opening of the Picton Reading-rooms two years ago was entertained at a public banquet, presided over by Lord Derby. We have on many occasions, ranging over a series of years, expressed our admiration of Mr. Picton's unflagging endeavours to benefit his native town, and have assisted in making known his own admirable works, and we rejoice greatly that his services are to be fittingly recognised.

SALE OF A LARGE BUILDING ESTATE, WOOD-GREEN.

LAST week Messrs. Fox & Bousfield offered for sale at the Auction Mart an important freehold property, designated the Chitt's Hill Estate, situated at Wood-green, on the high road to Southgate, and described as within six miles from the city, and within ten minutes' walk of four railway stations. The auctioneer stated that the property comprised a spacious mansion and forty-one acres of land, immediately available for profitable development by being divided into building plots. He observed that if they gave him 1,000*l.* an acre for the property, it would be less than the value of land in the locality. The first offer was 20,000*l.*, and the property was ultimately sold for 29,000*l.* A freehold residence, with seven acres of land, situated between Tottenham and Southgate, was next offered, and sold to the purchaser of the previous lot for 7,000*l.*

OPENING OF THE CLACTON-ON-SEA WATERWORKS.

ON Tuesday last the Directors of the Clacton-on-Sea Gas and Water Company formally opened their waterworks at Clacton. The ceremony of starting the engines and pumps, and turning on the water to the town mains, was performed by Mr. S. Chaplin, Mayor of Colchester, in the presence of a large assembly. The engineer, Mr. Jabez Church, M. Inst. C.E., who designed and carried out the works, explained the working of the machinery, and conducted the party over the works, which were tastefully decorated with flags and flowers. The Mayor, in an appropriate speech, declared the works to be opened. The party then walked through the company's gasworks (which adjoin the waterworks), where the process of gas manufacture was explained, and afterwards assembled at the Royal Hotel to do justice to a good dinner.

These waterworks were commenced in May, 1880 (trial borings having previously been made), by the sinking of an artesian well to the depth of 120 ft. from the surface, with a boring continued to a depth of 405 ft. into the chalk. The water, which is said to be of a remarkably good quality, is pumped into the tower by a 15-h.p. engine, and "bucket and ram" pumps in duplicate.

The tower itself, which is built of red brick with Bath stone dressings, is 101 ft. high, and contains a wrought-iron circular tank, holding over 30,000 gallons, which is carried on wrought-iron girders. The service of water will be constant, and the pressure of water sufficient to throw a powerful jet over the highest house in Clacton.

The contractor for the well and main-laying was Mr. T. Tilley, of Walbrook; for the engines, boiler, pumps, and tower-tank, &c., Messrs. H. Young & Co., of Pimlico; Messrs. Saunders & Son, of Dedham, Essex, were the builders, and Mr. H. Caldicott was the clerk of works.

THE ROYAL ARCHÆOLOGICAL INSTITUTE AT BEDFORD.

ON Monday the annual congress of the Royal Archæological Institute was inaugurated at Bedford. The president of the meeting is Mr. Charles Magniac, M.P., of Colworth Park.

At twelve o'clock the Mayor and Corporation of Bedford welcomed the arrival of the members of the Institute in formal state at the New Corn Exchange, when the town clerk read a congratulatory address, acknowledging the honour paid by the Institute to their ancient town. This address was followed by others from the Bedfordshire Antiquarian and Architectural Society, and from the committee of the local Literary Institute, which were all courteously acknowledged by Lord Talbot de Malahide.

Mr. Magniac, the president of the meeting, delivered an inaugural address, in the course of which he heartily welcomed the arrival of the congress, and expressed a hope that they would turn to good use the opportunity of investigating the antiquities of the county and neighbourhood, and would assist the local students by their wider experience. He drew a brief sketch of the past annals,—for they could hardly be styled history,—of Bedfordshire under the Romans, Britons, Saxons, and Normans, and enumerated the chief points at which the annals of Bedfordshire threw a light on those of England. In confirmation of a remark made by Lord Talbot de Malahide, he expressed a hope that before long an attempt would be made to compile a systematic county history of Bedfordshire,—a work which could never be satisfactorily executed except by co-operation and sub-division of labour. He concluded by drawing the attention of the meeting to the great and important light that had been thrown on the history and civilisation of ancient peoples in the far distant East by the researches of Layard, Rawlinson, Wilkinson, and Schliemann, remarking that England also, and even Bedfordshire, had a past, and that that past was well worthy of serious study.

A large number of ladies and gentlemen were subsequently entertained by the Mayor and Corporation at luncheon in the Corn Exchange, and during the afternoon the members of the Institute, under the guidance of the local secretaries, perambulated the town, visiting the site of the old castle and its keep, the churches of St. Mary and St. Peter, and the remains of the Greyfriars Priory on the west side of the town. The evening was devoted to the reading of papers in various sectional meetings at the public rooms, which have been placed at the disposal of the members of the congress during the week.

MORNINGSIDE.

SIR,—The information in your Edinburgh article as to the purchase and proposed conversion of the United Presbyterian Church at Morningside into a literary institute is not quite accurate. The cost of the alterations is estimated at only 800*l.*, and not 2,000*l.* This is the recommendation of the provisional committee, but of course the plans will be subject to revisal by the directors of the company when formed. They (the committee) did not think that they would be justified, from the limited revenue they expected, in going to greater expense meantime. They had particularly in view, too, the fact that the usefulness of a kindred institution situated in the suburbs of Edinburgh has been much impaired by its being started with too large a capital. With regard to the "air and space" in the proposed lecture-room, I may mention that the height from the floor to the ceiling will be 28 ft.

A MEMBER OF THE COMMITTEE.

LEITH IMPROVEMENT SCHEME.

SIR,—In a notice of the Leith Improvement Scheme, which appeared in the *Builder* of the 25th June last, the writer of the notice, in referring to the writer of this letter, states that the objector appeared in person before the Committee of Parliament, but that his objections were more devoted to the working of the Act than to the merits of the scheme.

This is a misconception of my position. My objections were entirely based on the proved fact that there was in reality no scheme of improvement submitted, there not having been one particle of reconstruction shown or provided for in the plans,—or rather plan, for there was only one of them,—before Parliament, or in existence. The Act itself is a good Act when faithfully administered.

JAMES HEDDLE.

DAMP: A QUESTION.

SIR,—I should like to have the opinion of some of your readers as to the cause of the following curious phenomenon. It is that of the cellars of a house, the floors of which are invariably *wet* in dry weather and *dry* in wet weather. The floors are formed of concrete and Portland cement, and the level of same is about 5 ft. below the level of the ground outside. The house stands upon a clay soil.

The land round about the house is drained by means of agricultural drain-pipes, laid about 3 ft. below the surface.

X. Y. Z.

CHURCH-BUILDING NEWS.

Holtby.—The small but interesting old church of Holtby, near York, having undergone restoration and refitting, has been re-opened. The cost of the work has been about 1,000*l.* Churchwarden restorers 100 years since had taken down the upper part of the stone building, removed the leaden roofs and ancient mullioned windows, and replaced the walls with brick and the windows with sashes, but fortunately they were content to go thus far without disturbing the foundations. Several feet of stonework, and what is believed to be the base of an ancient apse, remained untouched. The form and workmanship of these remains, it was thought, pointed to a very early origin, and the architect (Mr. J. R. Naylor, of Derby) has given due weight to these remains as indicative of the style adopted. The contractors for the works were as follow: — Mr. W. Rookledge, carpenter and joiner's work; Mr. C. Kilvington, mason, bricklayer, and plasterer; Mr. Dodgson, tiler's work; Messrs. Hodgson & Son, plumber and glazier's work; Mr. Boynton, painter's work, all being residents of York.

Newcastle (Staffordshire). — St. George's Church was re-opened on the 8th inst. after restoration. The church was erected about fifty-three years ago by the Ecclesiastical Commissioners, and is of the style of Gothic archi-

tecture in vogue at the commencement of its revival. About two years ago considerable alterations were made to the east end, as far as the funds permitted, by the formation of a chancel out of the eastern bay of the nave, and the formation of a proper choir therein. The completion of the whole scheme of restoration has now been carried out by the removal of the high-backed pews, the re-arrangement of the aisles, and the re-seating of the whole church with open benches of pitch pine. The interior has been cleaned and painted. The old stone paving has been removed from the aisles, and new tile paving by the Campbell Brick and Tile Company substituted for it. The projecting part of the west gallery has been removed, and the remaining part of this gallery over vestries has been re-seated, and a new front of pitch-pine added. A new font, by Jones & Willis, of Birmingham, has been fixed near the south door. Just before the closing of the church on Easter Day of this year, a new stained-glass window, by Messrs. Hardman, of Birmingham, was placed at the east end of the south aisle. It was the gift of Mr. R. Mosley, as a memorial to his daughter. Since then the old east window has been removed, and a five-light tracery window substituted for it. This will shortly be filled with stained glass by Messrs. Hardman, and is the gift of Mr. H. Coghill. A new tile reredos is in course of preparation by Messrs. Minton, Hollins, & Co. The whole of the works have been carried out by Messrs. H. & R. Inskip, of Longton, from the designs and under the superintendence of Messrs. Thomas Lewis & Sons, architects, Newcastle. The cost of the restoration has been about 1,400*l.*

Westleigh.—The Bishop of Manchester has consecrated the new Church of St. Peter at Westleigh, which has been erected at a cost of 7,000*l.* by Mrs. Sarah Walker Hampson, of Cheltenham. The site, which contains 1,460 square yards, has been given by the Rev. J. H. Stanning, vicar of Leigh. The church has been built from the designs of Messrs. Paley & Austin, architects, Lancaster, and will seat 424 persons.

STAINED GLASS.

Barton-on-Irwell.—A stained-glass window has just been erected in Barton-on-Irwell Church, Manchester. The window is in character with the style of the architecture, viz., Early English. The subject illustrated is the Parable of the Sower, treated in medallions, the centre medallion containing the principal figure of the Sower, and the upper and lower medallions "The end of the world, with the reaping angels," and "The enemy sowing tares while the husbandmen sleep." The work was designed and executed by Messrs. Shrigley & Hunt, Lancaster and London.

Edinburgh.—A stained-glass window, dedicated to the memory of the late R. S. Grindlay by his fellow-students, has been erected in the Chapel at Fettes College. The three main compartments contain a representation of the scene at our Lord's sepulchre on the morning of his resurrection, as recorded in the 20th chapter of St. John. The rich Flamboyant tracery is filled with diapered glass. The design and execution of the glass are by Messrs. Ballantine & Son.

Charterhouse, London.—Three Munich windows representing the Crucifixion have just been erected by Messrs. Mayer & Co., in the Church of St. Mary, Charterhouse, to the memory of the Rev. W. B. R. Jacobson, a former vicar of the parish; and a fourth light, containing a figure of St. Peter, in memory of Captain Rowland Bentinck Codd, late Governor of H.M. Prison, Clerkenwell.

Micheldever.—During the week ending July 2nd, a stained glass window was placed in the west end of the parish church. The style of glass used is that of the fifteenth century. The window is a six-light one, in two tiers of three each, the first light, which is in the upper tier, representing Mary (the mother of Jesus); the second, Jesus Christ; the third, Martha; the fourth, the Women at the Sepulchre; the fifth, the Angels at the Sepulchre; and the sixth, St. John and St. Peter, St. Peter being represented holding keys. The work reflects great credit on the firm of Messrs. Clayton & Bell, of London.

Bristol.—A large window has been fixed at the west end of Christ Church (Congregational), Sneyd Park, Bristol, to the memory of Mrs. Derham, wife of Mr. James Derham, of Sneyd Park. The window was designed and executed by Messrs. Camm Brothers, of Smethwick, near Birmingham. It contains eighteen subjects typical of the Old and New Testament history.

Birmingham.—A new window has been placed in the north side of the chancel of St. Martin's Church, Birmingham, as a memorial to the late Rev. Canon Miller, of Greenwich, formerly rector of St. Martin's, by the members of the congregation. The subjects of the window are selected from the life of St. Paul, and are as follows:—"St. Paul's Conversion," "Before Festus and Agrippa," "Prisoner at Rome," and "Paul at Athens." The window contains three lights and traceries. The upper portion of the lights is occupied by the large subject of "Paul on Mars Hill." Paul as the central figure stands with his hand uplifted, delivering his message; and below him are the Areopagites seated, with other listeners, among whom is Damaris, standing or seated behind them. At the back of Paul rises the Acropolis, with its walled enclosure and temples. Below this subject, and divided by a band containing the text, "Then Paul stood in the midst of Mars Hill, and said, 'Ye men of Athens, I perceive that in all things ye are too superstitious," are the three minor subjects. The window has been designed and executed by Messrs. Camm Brothers, of Smethwick.

Newington.—The large east window of St. Andrew's Church, New Kent-road, has lately been filled with stained glass. The subjects represented are the "Crucifixion," "Resurrection," "Healing the leper," and "Christ blessing children." In the tracery is represented the "Majesty" surrounded by cherubs, the "Agnus Dei," "Pelican in her piety," and several other emblems. The window is the gift of Mr. Jerman Nobes, and has been designed and executed by Mr. Charles Evans.

SCHOOL BUILDING NEWS.

Tollington Park, Holloway.—The new buildings at the Collegiate School, Tollington Park, recently erected at the cost of Mr. R. Wills for the Principal, Mr. W. Brown, were opened a few days ago. The new school-room (which is on the first floor) is 62 ft. long by 29 ft. wide, and 23 ft. from floor to apex of roof, with communications on each side to adjoining houses; the one at entrance being the residence of the Principal, the other house being devoted to the use of the masters and boarders, while the ground-floor is arranged as class-rooms connected with the school-room. The roof is of composite construction, having wrought-iron trusses with fir wrought purlins and ridge, covered with wrought and jointed boarding, roofing felt, and slates. The floor, which is also composite, is carried by rolled iron girders on piers built in cement, with buttresses on outside of wall, and by cast-iron columns in centre of each girder; at the west end of room a platform is constructed to receive the organ, also for the use of pupils during examinations. The iron-work was supplied by Messrs. Measures Bros. The ventilation is by inlets from below the floor, opening into the room at dado level. For the artificial lighting, two sunlights are provided. The space immediately under the school-room is devoted as a cloister for the use of pupils during the wet weather. The playground is laid with tar paving supplied by Messrs. Hobman & Co. The walls of the school-room are faced externally with picked stocks. The front elevation, which is of a Queen Anne character, is built of stocks, relieved with red brick dressings, with terra-cotta balustrade and capping. The entrance and lights to cloisters are provided with wrought-iron gate and grille. The works have been carried out by Mr. Harold, from the designs and under the superintendence of Mr. F. H. Stringer.

Grampound.—Sir John St. Aubyn, bart., M.P., has laid the foundation-stone of the new Wesleyan Sunday-school building at Grampound. Messrs. Gillard & Bennett are the architects, and Messrs. R. Tregunna & B. Turner are the contractors.

Lewes.—New Sunday-schools for St. Michael's parish, Lewes, are now in course of erection by Mr. Edward Pullinger, builder, the architect being Mr. Philip Currey.

Truro.—The Lord Mayor of London recently laid the foundation-stone of the Cornwall Wesleyan Middle-class Schools at Truro. The schools, which will accommodate about 150 boarders, besides day-scholars, are of Gothic design, and built of local stone, with brick and granite facings. Mr. Ewtwell, of West Bromwich, is the architect; and the contractors are Messrs. Julian & Sons, Truro. The amount of the contract is 5,185*l.*, including the building of the master's residence.

Books.

Dirty Dust-bins and Sloppy Streets: A Practical Treatise on the Scavenging and Cleansing of Cities and Towns. By H. PERCY BOULNOIS, C.E. London: E. & F. N. Spon. 1881.

THE object of this little book is not merely to assist surveyors of towns in their endeavours to do their duty properly, but to interest the householders in the subject, and lead them to aid in the good work. It is well calculated to effect these purposes. Mr. Boulnois arrives at the opinion that the work of the collection of house-refuse and cleansing the streets should be carried out by the local authority with their own officers and staff, and that executing this work by contract is a mistake and a false economy. It may possibly be true that it may be done in the latter manner at less actual cost to the ratepayers, but he thinks, and we agree with him, all public work should be done in the best manner possible, irrespective of cost, thoroughly, but without extravagance, and that the result of such work, especially where it affects the cleanliness and the appearance of a town, soon fully repays any moderate extra cost that may thus have been incurred, irrespective of the enormous benefit that is conferred upon any community by the reduction of disease and the death-rate by a proper attention to such necessary sanitary work.

Miscellanea.

Building Stones in America.—The United States Census Bureau has undertaken an important work in collecting information relating to quarries of building, flagging, ornamental, and other kinds of stone in all parts of the country. The inquiries cover not only the location and extent of the stone, but the amount of capital employed, the annual output, methods of quarrying and dressing, number of hands employed and wages paid, methods of transport and their cost, number of structures of all sorts made of each sort of stone, and so on. All of the quarries in the United States which produce such an amount of material as to give them anything more than local importance are to be visited by gentlemen of scientific reputation. In many areas, these gentlemen are the State geologists; in others, they are professors or architects. The statistics which are to be gathered by these gentlemen will give the locations of all important quarries; the kind of stone which they produce; the uses to which it is applied; the extent to which it is used in the neighbourhood, or shipped to distant points; the amount of material which is annually produced; the amount of material which has been produced as indicated by the area of the excavation; the size of a single block which has been extracted; the size of a block which might be extracted if desired; the structure of the stone as regards stratification and jointing; a description of the methods employed in quarrying, in dressing, and in transporting the stones; and scientific information concerning the geological age, and the forms in which the stones are found. Appended to the schedule upon which this statistical information is gathered, there are a number of pages which are to be devoted to remarks and to information which applies to the individual quarry under consideration. Dr. Hawes says the work has progressed so far "that we are able to say, that from the experience and knowledge of the parties who are gathering the statistics, we are obtaining a vast amount of most valuable information under the head of these remarks. And we also know that already in these remarks we have a great deal of information which will prove of much value to those who employ stones in construction." He rightly urges the importance of microscopic examination of stone.

City Property.—At the Auction Mart, a few days ago, Messrs. Edwin Fox & Bousfield sold the premises, No. 63, Gracechurch-street, occupying an area of 1,500 ft., with a frontage of about 14 ft., let at 160*l.* per annum, for 10,900*l.* Also two houses in Plough-court, Fetter-lane, let at 225*l.* per annum, for 4,500*l.*

A Brave Workman.—At a meeting of the Chapter of the Order of St. John of Jerusalem in England, held last week at St. John's Gate, Clerkenwell, General Sir John St. George, K.C.B., presiding, the silver medal for saving life on land was unanimously voted to George Everett, of Gloucester, for rescuing Edward Prickett, on June 13 last, from a position of great difficulty and danger. Some workmen were taking down a girder at the old City Gasworks, Gloucester. Prickett was on an iron column, 40 ft. high, at one end, and a man named Newey at the other. Suddenly the girder broke in the middle. Newey was flung into an adjoining tank and killed immediately. Prickett tried to jump on to the roof of an adjoining house, but was caught by a rope, and was thrown back into the cap at the top of the column, and became insensible. Attempts were made to reach him with a ladder, but the oscillation of the pillar was so great as to threaten to throw him out of the cap. Everett therefore volunteered to ascend the pillar, and did so by "swarming." He then held Prickett securely until ladders were so placed that he could lower him with a rope, at a risk of falling a depth of 80 ft., though fortunately he succeeded in descending himself also in safety.

The Tapestry at St. Mary's Hall, Coventry.—This fine old tapestry, which has been exhibited at South Kensington Museum for several months, has been returned and re-hung. The restorers are Messrs. Bartlett & Co., 18, Blenheim-street, Great Marlborough-street, London, who were entrusted with the work, on the recommendation of Mr. George Scharf, the director of the National Portrait Gallery, Messrs. Bartlett having effected the restoration in a manner that leaves no room to doubt their conscientious and faithful labours. Mr. Scharf says there is little doubt that the design of the tapestry was Flemish, and that it was most probably manufactured in this country. He considers it a fine example, but in describing it to the Society of Antiquaries in November last he said it was woven, not embroidered. The date he assigns to be about 1490, from the fact of the persons represented being Henry IV. and his Queen Margaret, and the members of his Court, but the costumes being characteristic of the reign of Henry VII. appeared to him to indicate that the work had been done in the time of that monarch.

St. Alban's Abbey Church.—At the last meeting of the Council of the Archæological Institute the following resolution was proposed by Sir Sibbald Scott, seconded by Mr. Matthew H. Bloxam, and carried unanimously:—"That the Council of this Institute desire to place on record the expression of their great regret at what they believe to be the unnecessary destruction of a large portion of the west front of St. Alban's Abbey Church, which has lately been carried out." Copies of this resolution were ordered to be sent to the chairman of the Restoration Committee and to the rector of St. Alban's.

Messrs. Macnaught, Robertson, & Co., of Bankend, Southwark, have issued a new section-book, in which they have classified the various sections of iron in most general use as much as possible, and in many cases given almost every variation of size capable of being rolled. From their extensive connexion with the leading English and Continental houses, together with their London stock and arrangements, we have found the firm able to supply with great promptitude. The present issue is likely to be of permanent use to home consumers as well as foreign shippers.

Horncastle's Newspaper List, 1881-82, is carefully compiled, and will be found handy to advertisers. Mr. Horncastle, in pursuit of his business as an advertising agent (a very well-known one too), gives in the shape of a preface some striking examples of the sums spent by particular individuals and firms in advertising, and the successful results of the course. He is quite right in saying it is of no use advertising in fits and starts; it must be done continuously and done wisely.

Exeter Art Exhibition.—An Art Exhibition,—confined to exhibitors in the county of Devon,—will be opened in the Albert Museum, Exeter, on the 15th of August, 1881.

Herr Ferdinand Keller, who first discovered remains of the ancient pile dwellings of Switzerland, died on the 21st inst., at Zurich, in his eighty-first year.

The Staff, to the number of forty, of Messrs. Merritt & Ashby, builders, dined at the King's Head, Chigwell, on Saturday last.

Tramways.—The tramway, as the parent of the railway, will always be regarded with interest in connexion with the subject of locomotion. The Gloucestershire *Chronicle* says:—When the practicability of using an iron line upon the ground for the passage of a wheeled vehicle was demonstrated, it was at once seen how greatly would be economised the force required to impel it, and, like many other simple things, it was a matter of astonishment that it had not been thought of before. The first iron road, we believe, was made at Whitehaven, in 1738, and a railway was laid down in Sheffield by John Carr in 1776. The term tram-roads is a perversion from Outram-roads, named after Mr. B. Outram, their inventor, in 1800. The iron tram-road from Wandsworth to Croydon was made in 1801, and in the same year the first iron railway was sanctioned by Parliament, with the exception of some which had been made by canal companies for branches to mines. In the following year the first locomotive engine ran, and in 1825 the Stockton and Darlington Railway, constructed by Stephenson and Pease, was opened. After this the use of tramways spread to coal-pits and quarries, and the improvements effected in the steam-engine necessitated modifications in the first forms which were used for railways.

Exhibition at Gandia, Spain.—A circular issued by the managing committee of this exhibition, which is to be opened at Gandia during the month of October next, announces that the railway trains and tramways running between Carcagente and Gandia have reduced 50 per cent. of their tariff fares on all the articles which may be carried by them for the above-mentioned exhibition, provided they are despatched during the month of September next. The committee therefore requests intending exhibitors to secure the accommodation necessary for their exhibits before the 15th of September, as it is the desire of the committee to afford every facility to all classes of exhibitors who may wish to join in this exhibition, which is expected to be very interesting, as stated by the industrial organs of Spain. Gandia is an agreeable town in Valencia, noted for the industry of its inhabitants, besides having some linen factories. Much hemp and flax grows here, and the culture of silkworms is carried on very extensively.

Sanitary Plumbing.—The sixth and last of Mr. Hellyer's lectures on the science and art of sanitary plumbing (given under the auspices of the National Health Society) was delivered on Thursday evening last, in the Hall of the Society of Arts, John-street, Adelphi, Professor Henry Robinson, C.E., of King's College, in the chair. We shall report the lecture,—which was to be repeated this (Friday) evening, the 29th,—in our next. In deference to an expressed desire, it has been arranged to hold a meeting for the discussion of Mr. Hellyer's lectures on Monday, the 15th prox., when Mr. Ernest Hart is expected to preside. Those who wish to speak on the occasion are desired to send their names to the Secretary of the National Health Society, 44, Berners-street.

Fatal Fall of a Building.—A child named Grace Jones, aged ten years, has died in Guy's Hospital from the results of injuries she sustained by the falling of a building in Southwark-square, Union-street, Borough. The "square" is reported to contain a number of wretched houses, long unoccupied, and which are stated to be the property of the Ecclesiastical Commissioners. Other children were seriously injured by the fall of the building. The line of the South-Eastern Company runs within a few yards of the portion of the premises which fell.

Bedford Park, Chiswick.—If any of our readers overlooked the advertisement in our last, announcing the proposed transfer of this estate to a company, and inviting applications for shares, they may be glad to have their attention directed to it. Full particulars, of what is a very interesting experiment, are given, so that intending investors can judge for themselves as to the prospects of the proposed company.

Sale of the late Sir Charles Reed's Mansion and Grounds, Tottenham.—We are told that this property was really purchased by the United Land Company for resale in plots in the ordinary course of their business.

Slate in Canada.—We hear that a valuable discovery of slate has recently been made on property owned by Mr. J. J. Vickers, of the Vickers Express Company, Toronto, within eleven miles of Fort William, Thunder Bay.

TENDERS

For the erection of new Coffee Tavern premises, 22, Paradise-street, Marylebone, for the Right Hon. the Viscountess Ossington. Mr. Chas. Fowler, architect:—

Watson Bros.	£3,995 0 0
Fairchild	3 893 0 0
Bangs & Co.	3,650 0 0
J. R. Hunt	3,674 0 0
Staines & Son	3,572 0 0

For the erection of a new school at Steam Mills, near Cinderford, Gloucester, for the Forest of Dean United District School Board. Mr. Alfred Smith, architect. Quantities by the architect:—

Pearson & Son, Ross	£2,752 0 0
D. C. Jones & Co., Gloucester	2,428 0 0
H. King, Glouce-ter	2,388 0 0
A. C. & S. Billings, Cheltenham	2,256 0 0
Coleman Bros., near Gloucester	2,215 0 0
H. Downton, Cinderford	2,200 0 0
Duggan & Norce, Hereford (accepted)	2,170 0 0

For additions and improvements to 4, Champion-park, Camberwell, for Mr. S. Dresser Rogers. Mr. R. P. Wheelock, architect. Quantities by Mr. H. E. Pollard:—

J. W. Sawyer	£994 0 0
J. Page	979 0 0
W. Smith	965 0 0
B. Colls & Sons	942 0 0
J. Tverman	877 0 0
J. Vears & Co. (accepted)	875 0 0

For the erection of a dwelling-house, stables, and coachman's house at Carsick Hill, Sheffield, for Mrs. Birks. Mr. Edward Robert Robson, architect:—

Ridal & Arnison	£10,627 10 6
J. Hall, Thorp	9,905 15 0
Chadwick & Co.	9,679 0 0
J. Tomlinson & Sons	9,044 0 0
Job Stone	8,837 0 0
Wm. Bissett & Son	8,500 0 0

For the erection of four shops on the Oak Lodge Estate, Edgware-road, Kilburn, for Mr. R. Rose. Quantities by Mr. H. E. Pollard. Mr. W. Graves, architect:—

Kirk & Randall	£4,580 0 0
Bolding	4,425 0 0
Scott	4,335 0 0
Jackson & Todd	4,328 0 0
Hard & Pollard	3,898 0 0
Stimpson & Co.	3,869 0 0
Kellond	3,600 0 0
Toms	3,364 0 0
Ward & Lamble (accepted)	3,233 0 0

For alterations and building new stables at North-street, Marylebone, for Messrs. Carnick & Co. Mr. H. G. Wyatt, architect:—

White	£1,375 0 0
Longmire & Co.	1,198 0 0
Wildman	997 0 0
Ward & Lamble	962 0 0

For repairs and painting at 68, Hamilton-terrace, St. John's-wood, for Mr. W. Todd. Mr. R. E. Pownall, architect:—

Clarke & Manncoch	£239 0 0
J. Tinson	204 0 0
W. H. Butcher	175 0 0

For pulling down 103 and 104, High-street, Winchester, and building new premises, for Mr. T. A. Brown. Mr. A. W. Galbraith, architect. Quantities supplied:—

	Credit Old Material.
Sims Bros., Basingstoke	£8,050 ..... £100
McManus, London	6,295 350
Mackie, Winchester	5,689 ..... —
Patman & Fotheringham, London	5,832 350
Fielder & Son, Winchester	5,458 300
Stevens & Sons, Southampton	5,557 300
Marsh, Winchester	5,750 800
Carter & Son, Winchester	5,670 400
Sealey, Winchester (accepted)	5,439 531

For building a dwelling-house in the Longbridge-road, Barking, Essex, for Mr. W. Bewers. Mr. C. J. Dawson, architect:—

Howe (accepted)	£618 0 0

For building a house and shop in the Broadway, Barking, Essex, for Mr. J. Pearson. Mr. C. J. Dawson, architect:—

Mansfield, Stratford	£711 0 0
Barnes, Ilford	709 0 0
Argent, Barking	698 0 0

For proposed alterations and repairs to premises, 44, Lamb's Conduit-street, for Messrs. T. Minn & Sons. Mr. C. J. Dawson, architect:—

Lawrence	£550 0 0
Wells & Son	488 15 0
Langmead & Way	477 0 0

For alterations and repairs at the Greyhound, Milton-street, City, for Mr. Manley. Mr. H. J. Newton, architect:—

Minchin	£398 14 0
Burman	368 0 0
Walker (accepted)	280 0 0
New Counter.	
Skinner	£135 0 0
Heath	129 0 0

For alterations to the Crown beerhouse, Chapman-street, St. George's-in-the-East, for Mr. Prior. Mr. J. G. Needham, architect:—

Marr	£250 0 0

S. W. Hawkings	226 0 0

For repairing and painting the Aged Pilgrims' Asylum, Camberwell. Mr. R. P. Wheelock, architect:—

J. Maraland	£185 0 0
S. Cooper	146 0 0
F. Hawkes (accepted)	123 0 0

For the erection of a new Baptist Chapel, Gipsy-road, Lower Norwood. Mr. Hampden W. Pratt, architect. Quantities by Messrs. Evans & Deacon :—

Higgs & Hill	£4,680 0 0
Shillitoe	4,495 0 0
Bowyer	4,250 0 0
Deacon & Co.	4,198 0 0
Goddard & Sons	3,988 0 0
Smith & Sons, South Norwood (accepted)	3,967 0 0

For new cabinet, &c., at the Fountain and Grapes, High-street, Borough, for Mr. Richmond. Mr. H. J. Newton, architect :—

Warne (accepted)	£650 0 0

For rebuilding the church and repairing the tower at Wimels, Macclesfield, for the Building Committee. Mr. R. Witts, architect. Quantities supplied :—

Burrows & Moseley	£1,126 8 0
Moores (accepted)	1,123 18 10

For erecting and completing model dwelling-house, Nos. 16 and 17, Church-way, Somers-town, for Mr. Chas. Deakin. Messrs. John Saville & Son, architects :—

Fawkes	£1,813 15 0
Temple & Forster	1,700 0 0
Anley	1,627 0 0
Royal	1,616 0 0
Wall Bros.	1,599 0 0
Wood	1,498 0 0
Richardson (accepted)	1,365 0 0

For erecting and completing stabling and dwellings above, in the Grove, Chapel-street, Somers Town, for Mr. George Earley. Messrs. John Saville & Son, architects :—

Temple & Forster	£1,186 0 0
Wood	1,097 0 0
Hawkins	1,063 14 0
Wall Bros.	1,015 0 0
John Anley	980 0 0
Richardson	955 0 0
S. Walton	949 0 0
Royal (accepted)	859 0 0

For repairs, &c., to 16a, Hampden-street, Somers Town, for Mr. Carn. Messrs. John Saville & Sons, architects :—

Shiers	£221 0 0
Wicks	190 0 0
Royal	178 0 0
Sims	165 10 0
Hawkins	155 0 0
Hyde	115 0 0

For the erection of manager's house and other premises, High Barnet, for Messrs. Elliott & Fry :—

Marriott Bros., High Barnet	£1,950 0 0
G. & J. Waterman, Watford	1,899 0 0
W. James, Barnet	1,795 0 0
W. J. Beale, Battersea	1,637 0 0

For three chapels, registrar's house and offices, front boundary walling, railings, gates, piers, &c., at the West Derby Cemetery, Liverpool :—

Tomkinson & Son, Liverpool	£18,243 0 0
Hughes & Stirling, Liverpool	16,950 0 0
Middlehurst, St. Helen's	15,841 4 3
Yates, Liverpool	15,498 0 0
Woods & Son, Liverpool	15,293 0 0
Mattack, Keighley (accepted)	14,718 8 1
Total of lowest separate tenders	14,471 11 10

For two blocks of infirmary buildings, New Shoreham, Sussex, for the Board of Guardians of the Steyning Union. Mr. Samuel Johns, architect. Quantities by Mr. F. Thompson :—

Marshall	£12,184 0 0
Perry	11,473 0 0
Kirk & Randall	10,820 0 0
Morris	10,740 0 0
Wall Bros.	10,685 0 0
Longley	10,637 0 0
Peters & Redford	10,275 0 0
Chappell	10,000 0 0
Cru tenden	9,711 0 0
Jones & Co.	9,364 0 0
Cook & Co.	9,197 0 0
W. J. Beale (accepted)	8,777 0 0

For taking down and rebuilding wall at Norwood Cemetery. Mr. E. l'Anson, architect. No quantities supplied :—

Lathey Bros.	£399 0 0
Piper	344 0 0
McLachlan & Sons	290 0 0

For alterations to premises, Buckingham Palace-road, for Mr. Gorringe. Mr. Walford, architect. Quantities supplied :—

Adamson & Sons	£4,375 0 0
Dove Bros.	4,240 0 0
McLachlan & Sons	4,140 0 0
Patrick & Sons	4,069 0 0
Hall, Beddall, & Co.	3,751 0 0

For building House of Retreat, Lloyd-square, Clerkenwell. Mr. Newton, architect. Quantities by Messrs. Palmer & Ruault :—

Chappell	£9,003 0 0
Patrick & Sons	8,955 0 0
Booth	8,850 0 0
Bangs & Co.	8,830 0 0
Brass	8,710 0 0
Dove Bros.	8,510 0 0
Higgs & Hill	8,420 0 0
McLachlan & Sons	8,392 0 0
Tyerman	8,077 0 0
Perry & Co.	7,547 0 0

For alterations and additions to 4, Farnley-road, Catford-bridge, for Mr. W. Elkerton. Mr. N. W. Hopton, architect :—

Eldridge & Gee (accepted).

For rebuilding 141, Southwark Park-road, for Mr. G. Kirby :—

Eldridge & Gee (accepted).

For repairs and additions to premises, 72, Great Prescott-street, for Mr. Friedlander. Mr. J. Hudson, architect. Quantities not supplied :—

Wyard	£337 0 0

All statements of facts, lists of tenders, &c. must be accompanied by the name and address of the sender, not necessarily for publication.

We are compelled to decline pointing out books and giving addresses.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

NOTICE TO SUBSCRIBERS.

THE INDEX and TITLE-PAGE for Volume XL. (January to June, 1881) were given as a Supplement on July 9th.

A COLOURED TITLE-PAGE may be had, gratis, on personal application at the Office.

CLOTH CASES for Binding the Numbers are now ready, price 2s. 6d. each; also

READING-CASES (Cloth), with Strings, to hold a Month's Numbers, price 2s. each.

THE FORTIETH VOLUME of "The Builder" (bound) is now ready, price Twelve Shillings and Sixpence.

SUBSCRIBERS' VOLUMES, when sent to the Office, will be bound at a cost of 3s. 6d. each.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS, TRADE, AND GENERAL ADVERTISEMENTS.

Six lines (about fifty words) or under ..... 4s. 6d.
Each additional line (about ten words) ..... 0s. 6d.

Terms for series of Trade Advertisements, also for Special Advertisements on front page, Competitions, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.

SITUATIONS WANTED.

FOUR Lines (about THIRTY words) or under ..... 2s. 6d.
Each additional line (about ten words) ..... 0s. 6d.

REPLIES TO ADVERTISEMENTS,
Addressed Box ——, Office of "The Builder,"
Cannot be forwarded, but must in all cases be called for, and the Office Receipt produced.

THE CHARGE FOR A BOX IS AS UNDER :—
For "Situations Wanted" Advertisements ..... 3d. per Week.
For all other Advertisements ..... 6d. per Week

PREPAYMENT IS ABSOLUTELY NECESSARY.

*** Stamps must not be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, King-street, Covent-garden, W.C. to

DOUGLAS FOURDRINIER, Publisher,
Addressed to No. 46, Catherine-street, W.C.

Advertisements for the current week's issue must reach the office before THREE o'clock p.m. on THURSDAY.

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied *direct* from the Office to residents in any part of the United Kingdom at the rate of 19s. per annum, *prepaid*. Remittances payable to DOUGLAS FOURDRINIER, Publisher, 46, Catherine-street, W.C.

Best Bath Stone.
WESTWOOD GROUND,
Box Ground, Combe Down,
Corsham Down,
And Farleigh Down.
RANDELL, SAUNDERS, & CO., Limited.
Corsham, Wilts. [ADVT.

Box Ground Stone
Is the best for use in all exposed positions, being a well-known and tried weather stone.
50,000 feet cube in stock.
PICTOR & SONS,
Box, Wilts. [ADVT.

Doulting Freestone and Ham Hill Stone
of best quality, in blocks, or prepared ready for fixing. An inspection of the Doulting Quarries is respectfully solicited; and Architects and others are CAUTIONED against inferior stone. Prices, delivered to any part of the United Kingdom, given on application to CHARLES TRASK, Norton-sub-Hamdon, Ilminster, Somerset.—Agent, Mr. E. WILLIAMS, 73, Charlotte-street, Portland-place, W. [ADVT.

Doulting Stone and Ham Hill Stone,
of best quality. Prices and Estimates, including delivery to any Station, on application to
STAPLE & HANN, Quarrymen, Stoke-sub-Hamden, Ilminster. Agent, E. CRICKMAY, No. 4, Agar-street, London, W.C. [ADVT.

Pompeii and Herculaneum.

IN the voluminous correspondence of Horace Walpole will be found an interesting letter, dated June 14th, 1740, N.S., sent home from Naples almost at the moment that the first excavations of Herculaneum made known to the world the treasures that were buried beneath the lava and the ashes of Vesuvius. In this letter, addressed to Richard West, the grandson of Dr. Burnett, the botanist, Walpole writes:—"This underground city is perhaps one of the noblest curiosities that has ever been discovered. It was found out by chance, about a year and a half ago." The truth of this prophecy has singularly been fulfilled. A few years only elapsed from that date, during which time Pompeii and its treasures were unearthed, until the artistic world of Europe was made as familiar almost then as we are now, with the wonders of the buried cities of the Campania, through the great works of Gell and Hamilton, the "Antichità d' Ercolano" and its French translation, and the exquisitely-rendered engravings of that master of illustrated publications, Piranesi, and his industrious assistants. All interested in Pompeii will remember the superb work of Lieut.-Col. Cockburn, "Pompeii," published as far back as 1819, and the letter-press accompanying the drawings in which,—one of these, representing the eruption of Vesuvius, was from a sketch by the late John Martin,—was from the pen of an earnest student, who still lives, loved and respected, among us,—Professor Donaldson.*

What has since those days been done in excavating Pompeii has been made known to the world from time to time in these columns, but notwithstanding the industry and care that have been bestowed during the last few years on the excavations, it will be found that but little has been recovered beyond repetitions of the wonders that were revealed during the first years of the discovery. In revisiting the Museo Borbonico after many years, the artist will find but little more than many additions to the antiquarian portions of the museum. Exceptions, of course, there are, but nothing equal in any case to the famous series so long known as the *Dansatrice*, although among the newly-found bronzes, perhaps the small drunken Faun, discovered within the last few months, is, in our estimation, likely to rank high among the noblest existing works of antiquity, the bronzes of the Greek artists. Archæologically and architecturally this discovery is most interesting, as the house in which this great Greek work was discovered was one of those of the latest erection in Pompeii, and unique in its architecture. Ill-constructed arches had been introduced, springing direct from the columns of the *peristyle*,* and the walls are miserably decorated.

It is very near where this bronze was so recently discovered that those who remember Pompeii in the old days will be reminded of its entrancing beauty and interest before the Government had taken upon itself the care of the classic city, and before it was determined—as it was necessary to do—to protect the crumbling walls by aid of brick-supports and over-hanging tiles, a sad necessity which has destroyed cruelly the picturesqueness of the outline in nearly all the familiar points. We remember some years since, not many years before the death of the late accomplished Frederick Cockerell, that he passed some time at Pompeii in sketching with his careful hand and thoroughly well-instructed mind the ruins of the city; these sketches, wherever they may be, should be preserved.

For the moment the excavations now being proceeded with are retarded by the obstinacy of the owner of a farm that has quietly existed for some centuries over what we may be quite certain is a very interesting portion of the buried city; the work is retarded, fortunately, we may say, because from what we have lately seen at Pompeii it is only at about this spot that the old picturesqueness of the Roman ruins can be seen as they were some years since. The rest of the city, with its wonderful interest, is now better kept, in better order, cleaner and better drained, than perhaps any other city in Italy; its houses all duly numbered, the streets distinctly marked, the roads and by-ways in perfect order, with a thorough system of police, scarcely a blade of grass allowed to grow in its now crowded streets, crowded by strangers from all parts of the world, all of whom enter this ancient Roman city by a patent turnstile which turns not before each visitor has deposited his two francs towards the continuation of the excavations. By this means the Government of Italy obtains yearly the very handsome sum of about 30,000 francs, with every prospect of this revenue increasing greatly year by year.

Those who have known Naples for some time find the pleasure of a visit to Pompeii is greatly destroyed by the modern system of entering through a turnstile, and when one is not provided with a special permission to wander about at leisure, the conduct over the ruins, even by the civil Government official who is tailed off to each party of visitors, would, we suspect, be to Mr. Arthur Sketchley or Mr. Barnard exceedingly provocative of merriment; for notwithstanding the attention of the custodians, the extraordinary variety of strangers that have to be trotted round in the course of the day gives rise to the most amusing episodes that sadly interfere with the serious object of a visit to Pompeii. Indeed, during a recent visit, we observed the possibility of Pompeii being made at times almost as great an aid to those lovers of social amenities, that large class of people who visit the Continent with the idea of increasing their visiting-list at home, as Mentone, Nice, or any other of the fashionable resorts. The time has certainly come when it is exceedingly risky to visit Pompeii in one's ordinary travelling costume, unless one is utterly regardless of that nice attention to the fitness of "get-up" that marks a correct sense of the exact hour of the day.

Notwithstanding the change in the system by which one now visits the ruined town, and notwithstanding the large element of destruction afforded by the numbers of strangers who literally invade, especially at certain seasons, the deserted streets, the old features possess none the less interest, and the visit to Pompeii and the insight it gives us into the life of our classic forefathers remains unquestionably one of the most vivid impressions that one bears away from a tour in Italy. One has seen before reaching Naples many museums and, above all, many towns, but they have become too much modernised to impress any but the most imaginative; but in Pompeii we find a city of the ancients almost untouched. The streets and pavements are the same they trod 2,000 years ago, and the deeply-worn wheel-marks in the well-paved stone streets speak of the busy traffic of a city not so very unlike our own great centres of population. After one or more visits to the superb museum in Naples, with its marvellous collection of works of art and scarcely less artistic domestic utensils, furniture, and what not, the existence in the houses that one is shown becomes realisable, and as the still plainly legible election programmes and notices of apartments to let conspicuously painted on the street front of many of the houses meet the visitor at every turn, as the theatres and the baths, the shops and the market-places, the temples and the tombs, follow each other, he gains in a few short moments a clearer insight into the life of these past generations so strikingly like and yet so different from our own, than the years of school teaching and familiarity with classic authors have been able to give. Here he sees the scattered relics of the art of these days in their original places, and can picture with more or less accuracy the surroundings that are wanting.

With the large space of Pompeii so far excavated, it can be understood how impatiently certain students look upon the slowness of the advance made. Considerably more than half of the known area of the city remains still buried, and a century and a half has been passed in unearthing the portion with which we are now familiar. If we mistake not, the present director of the excavations has calculated that at least another seventy to eighty years are necessary,—continuing the explorations at the

* Pompeii: Illustrated with Views, &c. The descriptive letter-press to each plate by T. L. Donaldson. London: Murray. 1819 and 1827. Two vols. folio. The work is of the same form as Stuart's "Athens."

* It is this very interesting feature to which Mr. Russell Forbes alluded in our columns not long since. See *Builder*, July 9, 1881, p. 44.

existing rate,—to unearth the whole city. In the mean time, there are not wanting partisans who sadly deplore the activity of the excavations on the somewhat sentimental ground that we are robbing our descendants of the pleasure that we have so largely experienced in the progress of the works during the last two generations. Certainly those who come after us cannot hope to see the city as we do; for those who remember Pompeii before the days of Signor Fiorelli, and the energy he introduced into the work, will tell one how sadly the beauty of the general effect has suffered, in spite of the learned director's efforts to arrest the injuries of exposure to the air and light.

There is, again, another race of students who take a higher ground, and who would wish the excavations of Pompeii to give way to a more systematic exploration of Herculaneum, as a field of far greater profit; who argue,—and certainly with truth,—that from what we know of Pompeii we may judge of what remains; that further research will tend far more to satisfy the archæologist and antiquary than the artist, while the buried houses of Herculaneum hide in their gloom and obscurity treasures of classic art of far greater interest than any that are likely to be found at Pompeii, with the character and tastes of whose inhabitants we are now more or less familiar. Certainly these earnest students are justified by what the very unsystematic excavations of Herculaneum have so far revealed. The choicest bronzes of the Museo Borbonico came from Herculaneum, the excavations of which remain yet scarcely commenced for want of funds to overcome the great difficulties met with. Our small knowledge of Herculaneum has shown us that its inhabitants were superior in their tastes to their neighbours at Pompeii, which, let it always be remembered, was a town of second or even third order, and in which it is now so easy to trace the almost painfully evident decline of the great art of the Greeks. For our part, we would much prefer, even if the excavations of Herculaneum involved much more time owing to the nature of the lava, than those of Pompeii, the inquiry in that direction than in the more popular city of Pompeii, because we have a stronger hope that in Herculaneum more treasures of an artistic kind are likely to be discovered. Especially, we are likely to find more works of art in bronze, that material in which all great artists have worked so successfully, and which time under almost all conditions has treated with so much tenderness that it is from the study of the bronzes of antiquity that we come nearest to a perfect knowledge of the art of the classic masters.

The bronzes discovered at Herculaneum have preserved almost precisely the tone and colour, the very surface,—the *patina*, as experts understand it,—that were seen by the great art-lovers eighteen centuries ago, a fact due to their preservation in the lava, which has in so many cases altogether left uninjured the surface of the bronze, while the chemical action of the cinders and boiling water poured down on Pompeii in the great eruption has not only corroded the surface of the bronzes there found,—so much so in many cases as almost to obliterate the form,—but by the corrosion has added a fictitious beauty, what one may almost call meretricious, in the fascinating tints of tender blue and green gradating into the richest tones of olive and purple.* The recently-discovered Faun,—to which we have referred,—is a splendid instance of this lovely colour caused by the conditions to which the bronze has been submitted: perhaps, beautiful as is this figure, it owes not a little of its charm to its present brilliant colour, which is, of course, altogether absent in any photographic copy, and which we find grossly exaggerated in most of those modern imitations which the French and other manufacturers have put into the market.

But apart from the fact that the bronzes found at Herculaneum have not, as we have above remarked, been submitted to this corrosive action, their artistic merit has been acknowledged to be of an exceptional nature, and yet a century and more has elapsed since the bronzes from Herculaneum, which form so conspicuous a feature in the Museo Borbonico, were brought to light. It will be seen that the artists who prefer that the energies and funds of the existing excavations should be directed towards Herculaneum have not merely conjecture on their side.

We gladly take this opportunity of mentioning the recent publication at Naples of a monthly review termed *Pompeii*, the aim of which, while amply suggested by the name, may be said to be somewhat more than a mere chronicle of the progress made in excavating Pompeii. In the programme attached to the first number of this publication, the director, Sig. Aug. Mele, set forth the intention of his journal to popularise and render industrially useful the science of archæology, at present too exclusively a subject of interest to a privileged few. By robbing it of the severity which is usually attached to its study, it is unquestionable that much may be done to spread in productive quarters the teachings that archæology regarded and pursued in the right spirit is capable of affording. This is to be more particularly the aim of the new publication; to render practical the archæological researches into the art of the classics, and in the several parts into which the publication is divided, "Industrial Archæology" is to take a large and important share. By the aid of careful illustrations,—in which the new photographic processes have been brought into requisition to reproduce the original drawings of the artists employed, a number of suggestive forms taken from the classic models found in Pompeii,—so rich in such models,—will be published to guide the modern designer and producer.

The field of suggestive ornament thus open to the editors is scarcely likely to be exhausted within a reasonable period. To all who are familiar with the treasures of what we should now call "industrial art," collected at the Museo Borbonico, the wealth of material will be remembered. In literally every direction, in every utensil and object for daily use, a due consideration to its artistic ornament seems to have been a *sine qud non* with the ancients; the rarest damascened silver work inlaid into bronze decorates the simple bed-head, the chair, and the litter; the keys found are in many instances richly damascened with silver, while not a vase or dish is to be found in the whole collection but what gives evidence of the minutest artistic attention. The distinction between the artisan and the artist was then well understood and clearly defined; in the case of a vase, for instance, if we mistake not, it was customary for the body of the vase to be the work of the artisan; its handles, and their mode of attachment, were left to the artist.

We have a strong belief that a renewed acquaintance with the treasures of classic art will be found to serve as a wholesome antidote to the recurring introduction of new fashionable "styles" and the sentimentalism of a certain kind of art about which we hear so much, and yet of which we so often find our friends expressing their weariness and impatience.

* This chemical action of the hot volcanic water on the works discovered in Pompeii, and which is entirely absent in those discovered at Herculaneum, enables even the uninitiated, when once informed of this fact, to judge from which city may have come the bronzes that are to be found in the museums of the world. Those from Herculaneum are black; those from Pompeii oxidised green. When these latter are of recent discovery, the oxidisation is of a beautiful deep blue colour, which, however, on exposure to the air slowly turns to green. It is needless to say that in the fabrications this blue is basely imitated, and never changes.

SOUTH KENSINGTON PRIZE DRAWINGS.

The annual exhibition of drawings and designs for which prizes have been awarded by the Department of Science and Art has been arranged this year in the south galleries (upper floor), adjoining the Horticultural Gardens. The drawings are not grouped so systematically as they might be, some classes of work being a good deal scattered. This applies especially to the architectural drawings, which seem to be hung in any corner where room can be made for them, instead of being grouped as one class.

It is, however, to these that we naturally look first, to see if any improvement has shown itself in this branch of the work of the Department, which has usually been very indifferent. There seems to be a little better work than in previous years, but that is not saying much. The gold medal for architecture is awarded to Mr. Herbert G. Smith, of Nottingham, for a design for a cathedral, which is illustrated by several elaborate drawings and a plan. The drawings show great industry and painstaking draughtsmanship, but they are certainly not remarkable as an illustration of modern Gothic design. The design is overdone with detail, wiry in effect, and wanting in real architectural solidity and dignity. No silver medal appears to have been given for architectural design. A bronze medal is awarded to Mr. Richard, or Richards, of Cardiff, for a design for a colonial town-hall. There are good points in the plan of this; the design is simply draughtsmanship, the repetition of thirteenth-century detail of French type. Mr. Price, of Nottingham, has a bronze medal for a cathedral design, which is "gim-crack" to a degree, and quite below the mark of what would pass as good at the Institute or the Architectural Association. There are a few very neatly-drawn designs for houses, each an imitation of certain accepted styles; some of them have the merit of being accompanied by plans. But the conclusion from looking at the architectural designs certainly is that the Department does not contrive to draw much architectural talent into its competitions. There are one or two careful bits of illustrative work; Mr. Pope's drawings from measurement of that curious piece of Gothic eccentricity, Cartmel Church, Lancashire, with its stumpy centre tower, with the bell-stage set diagonally on the substructure; and there are several tinted elevations from actual measurement of part of Greenwich Hospital, which speak well for the accuracy of the draughtsmen who measured and drew the building, for though by different hands, they are so precisely similar in appearance, and even in manner of shading, as to suggest at first the idea that they are multiplied copies of the same drawing. Mr. Woodhouse (South Kensington) takes a gold medal for studies and measured drawings of church porches,—a medal which seems rather easily won.

The drawings from casts of ornament are, in the best specimens, as good as work of this class could possibly be. The monochrome drawing of a piece of Roman ornament, shaded in sepia, by Mr. Marshall, of Chesterfield, for which the silver medal has been awarded, is a beautiful specimen of architectural detail-drawing; and we were much pleased also by the fine bold drawing in oil monochrome, by Mr. Stephenson, of Bradford (bronze medal), of a piece of acanthus scroll ornament, showing that the author fully understands the value of broad masses of light and shade on ornamental work of this class.

Turning now to the most important and difficult branch of all,—the drawing of the nude figure from the life, we find the gold medal for drawing awarded to Mr. Alfred Hitchens, of the South Kensington School, for a chalk drawing from a male figure holding a small sword, and in the attitude of a warrior disposed to conquer or die. The same model, in the same pose, is the subject of several other studies; the life-studies of this class appearing to come chiefly from South Kensington itself, or from Lambeth. We may, in the first instance, remark on the poor character of the models which these two schools seem able to procure, a point which we have noticed before. There is certainly nothing very inspiring, from an artistic point of view, in producing realistic copies of a figure which may be that of a most worthy and respectable man in his occupation, but which has certainly no form or comeliness that we should desire a repetition of his thin and scraggy outward semblance. We notice the same drawback in the other life-studies; short-legged and stumpy women, men of what is vulgarly called "pot-bellied" development, and so on. The practice in drawing is the same, in a sense, no doubt, but certainly the interest in drawing is not the same, nor the education of the eye and taste; and since it is unquestionable that better models than these are "in the market," we should have thought central schools like South Kensington and Lambeth might have afforded to procure them. Passing over this, we may say that the gold medal seems rightly awarded to this figure, which shows considerable freedom and mastery of drawing, and which we like rather the better that it is not overshaded and stippled like some of the others. At the same time, we have a most decided opinion that the lower leg, below the knee, is too long, especially in the right leg, unless the model was very abnormally proportioned; a comparison of the proportions with Professor Marshall's standard of the figure certainly bears out the opinion. The silver medal is awarded to Mr. Pearce, of Lambeth, for a rather weak study which has been overworked in the mere mechanical portion of shading and finishing. We have before expressed the opinion that both in the antique and occasionally in the life department, a good deal too much time is expended on this elaborate

surface finishing, which does not teach much. Miss Mary Drew and Miss Helen Jackson, both of Lambeth, take bronze medals for good drawings of the female figure, that of the latter especially, a back view study of the full-length figure, is a very good drawing. Miss Kate Evans (bronze medal) has a "time sketch" in crayon of a female head from life; but we are not told what the "time" was, which is certainly an element in judging of the merit of the result. The gold medal figure for oil-painting from the nude is better than any of these, and the result much more pleasing, the artist, Mr. Breakspeare, of Birmingham, having had the good fortune to have a fine figure with an expressive head to work from, to which he has done great justice both in drawing and colouring, and this may fairly be said to be the finest and most pleasing work in the collection. Miss Ellen Robertson, of South Kensington (bronze medal), has a good oil-painting of a head with a red fez, from life. The oil figure studies are not numerous, nor on the whole very noticeable, except the gold medal one. The figure studies from the antique are numerous and mostly very good, but too much care and time is bestowed on mere finish in shading. The authorities, however, do not seem to take this much into account in the awards, as the gold medal has been given, and rightly given, for a drawing by Miss Mary Surenne, of Edinburgh, which is less highly and smoothly finished than many of the others, but is more broad in style, and more correct and careful in the drawing of the extremities, than others in the same class of work.

The gold medal for sculpture has been awarded to Mr. Drury. This is called an honorary award, but we are not aware in what respect the recipients of honorary awards stand on a different footing from the rest. This is a seated figure, nude, of a man in the act of turning round, and half moving away as if startled by something. The extremities are roughly finished,—perhaps are not intended to be otherwise; but the general attitude and action of the figure show much energy and movement, and the arms are very well and freely modelled. The sculpture exhibits are not numerous. A silver medal is given for a cast of a caryatid figure for one end of a chimneypiece, which is very good, and well suited to its position; this is by Mr. Mark Rogers, of Lambeth.

Still-life studies in oil and water-colour are, as usual, numerous, and with a high average of merit. The gold medal for oil painting in this class is awarded to Mr. R. S. Morrison, of Liverpool, that for water-colour to Mr. Frank Suddards, of Bradford Grammar School; the latter shows some admirable work. But we prefer to turn to some of the examples of ornamental design, which deal with subjects more directly connected with our own. The gold medal for the Owen Jones competition is given to a design (for a carpet) by Mr. Gideon Fidler, of Salisbury, which is delicate and good in colour, but very deficient in design, consisting only of flower forms geometrically arranged, with no connexion or growth in the design, and the border, with its festoons hanging outwards all round, is very poor in taste. Owen Jones, we feel convinced, would have approved much more of the silver medal design, by Mr. J. H. Lamb, of Kidderminster, which is slightly raw in appearance in the colour as shown in the drawing, but is a very fine, rich, and original design of the true Owen Jones type. The gold medal for wall decoration is awarded to Miss Liberty, of Nottingham, for a good design in rather sombre colours. There are other designs very good in this class, but we do not impugn the award. The lace designs are many of them charming; we have always found them among the best things in the collection. The designs by Miss Mary Joyce, of Dover, for which the gold medal has been awarded, are very good, though we can hardly say they are superior to some others that are exhibited. Miss Joyce's designs, as well as a majority of those exhibited, are founded on realistic foliage. We doubt whether forms that are a little more abstract are not really better suited for lace. There are, at any rate, two very good ones, one of a rather Renaissance type, a curtain by Mr. Lawrence Kirk, of Nottingham (silver medal), which is very refined and well carried out, in the border especially; and another with a touch of Moorish feeling (the name of the author we omitted to note), which is very good; and there are other admirable specimens.

Among the remaining works are good designs for painted china plates by Miss Edith Robinson and Miss Alma Hodge especially; wall papers, which are very good, but which we cannot give space to particularise; a clever bit of original design for wrought ironwork by Mr. Albrow, formed from long reedy plant forms twined together, a trifle too naturalistic, but very suggestive and clever; some clever designs for mosaic floors, including an elaborate study by Mr. Stevenson for a floor founded on Celtic forms of ornament; an inlaid table-top design by Mr. Hayes, of Renaissance type of ornament, very good; and many other little bits of work which would well deserve praise if we had space to particularise them. In short, the department of decorative design seems in a very prosperous and encouraging condition; and if there is a certain amount of weak and uninteresting, or merely imitative work, there is hardly anything that is in bad or vulgar taste; and the mere fact that we can say this shows what an advance has been made in this class of design of late years. We should like to see a larger proportion of life figure studies of a finer type, and of original conceptions in figure subjects.

"SUGGESTIONS IN DESIGN."

The work published under this title* is an amplification of one published by the same author, under the *nom de plume* of "Luke Limner," in 1852–3; a good many of the sketches in the present work we remember noticing in the original one. The latter, we may frankly say, left on us the impression of a work showing some cleverness with a good deal of eccentricity, and with little indication of any serious aim. The present volume adds to the previously published "Suggestions" a considerable number of new ones, and a long and elaborate essay on ornament, dealing in a good many chapters with the respective characteristics of various styles of ornament, from the pen of Mr. J. K. Colling, whose own works, both in literature and in architectural design, have shown that he understands the principles of ornament. There is thus evidence of something like a serious intention in the work as now issued.

In his Introduction, Mr. Colling suggests, not without some truth, that civilisation has stunted what might have been the average power of drawing by the substitution of writing to express ideas, so that the mode of delineation generally distinguished as "drawing" has become in the scheme of education a secondary subject, not by any means to be taught as a matter of course, but only in exceptional cases, or left to be acquired by individual effort. Considering that writing expresses more complicated ideas, and expresses them with more completeness and certainty in general than drawing ever could, it cannot be doubted that writing is the more urgent necessity of the two for the conduct of life. But it is well to remember that in some ages and countries much less cultured than our own, a higher general power of drawing was attained than is possessed among us now, simply owing to the fact that it was a recognised method of communicating ideas, and as such was generally learned and practised. There is no doubt that if drawing were made as essential a part of primary education as writing now is, and if failure to acquire any command over it were regarded as a failure to be rather ashamed of, as it is in the case of writing in schools, there would be an astonishingly larger percentage of persons who could draw fairly than there is to be found among us at present. As it is, it is never expected that any one, because he is an educated man, should therefore be able to draw even the simplest object, or should evince even the most rudimentary notions of perspective. If he does so, it is a feather in his cap, and he is a kind of marked man among members of ordinary society; if he does not possess the least vestige of the power no one expects, or feels entitled to expect, it of him. Now, as it is perfectly certain that the vast majority of people can learn to draw if they are taught, it seems absurd that we should have this state of incapacity to handle a pencil so prevalent among us, and that we should see an otherwise cultivated and clever man so hopelessly at a loss if, on some unwonted occasion, he attempts to express with a pencil his recollection of the form or construction of some object which he wishes to describe. Nothing is more ludicrously painful than the hopeless "dash at it" which such a man makes with a pencil when he ventures to attempt the use of one; scribbling at random on the paper in search of the lines which would express what he wants, but which he cannot stumble on. A very little direct education in the matter would probably have taught most of these bewildered ones, if not to originate design, at any rate to know how to reproduce a form on paper correctly; and when the time comes when drawing is recognised as a proper branch of liberal education, probably even those who advocate it may be surprised to find how much can be done by the majority when they are once persuaded that the art, up to a certain point at least, is as easily acquired as a good many other accomplishments which are not considered extraordinary or out-of-the-way achievements for people of average talents. We have been saying this for many years, and a belief in the truth of it is slowly growing.

This, however, is by the way, Mr. Colling's remark in his Introduction having set us off on a subject we are at all times eager to recommend to public consideration. Turning to Mr. Colling's "principles of design," which are stated in a tabular form in the next chapter, we find ourselves in agreement with nearly all of them, but not always with the reasons given for them or with the comments added to them. There are some, however, which are to be noted because they are not so often insisted on in theory as others, and are constantly broken in practice. For instance, that "ornament in relief should not be added to or overlaid upon the construction. . . . . For example, wreaths and festoons are frequently placed so as to hang over arches, mouldings, and other enrichments. They are thus separate from and added upon the construction, and therefore, never aid the beauty of a work." This has been long recognised in theory in regard to the addition of useless architectural features, but the very architects who would avoid adding a sham buttress or a sham turret with the idea of ornament, do not scruple to overlay a building with impertinent ornaments which have no relation whatever to the constructive design of the building, and this fault is just at present absolutely rampant among us. Again, "all ornament should be taken or worked out of the solid material, not added upon it. . . . . In wall surface, the carved enrichments should be taken out of the wall, not added to it;" a maxim the truth of which will be intuitively felt by every one who has a grain of innate perception of the fitness of things, but which is frequently ignored by people who are supposed to represent artistic culture, and who, therefore, might be expected to know better. In illustration of the axiom that "all ornament should be subordinate to the subject ornamented," Mr. Colling gives the very apt illustration of the class of carved sandal-wood boxes so familiar to students of Indian art, in which, as he says, the form of the box is not in any way altered by the vast amount of ornament carved upon it. But when the author repeats the axiom, before laid down so strongly by Owen Jones, that "all ornament should be founded on a geometrical basis," and adds that "this is a natural law which may be found in nature by study and observation," we must differ from him. It is found in nature, undoubtedly, but by no means with that frequency and regularity which would justify us in speaking of it as a natural law. And, in fact, the implied necessity of going to nature to justify everything we do in ornament argues a mistaken view of the subject. The principle which is followed out in the geometrical spacing of ornament is one which has its root in metaphysics, not in natural forms at all. Ornament is the arrangement and treatment of forms which may or may not be derived from external forms in nature, according to laws which are very deeply seated in our conceptions, but which are based on metaphysics, on the abstract proportions and relations of numbers and geometry, not upon the habits of nature as illustrated in her visible and palpable growths. Besides, in laying down such a rule as this, although we hold it to be in the main a perfectly sound one, there should, at least, have been some hint of the fact that there are schools of ornament which have come in for much admiration of late, in which geometrical spacing is

* Suggestions in Design, being a Comprehensive Series of Original Sketches in Various Styles of Ornament, arranged for Application in the Decorative and Constructive Arts. By John Leighton, F.S.A. With descriptive and historical letterpress by James K. Colling, F.R.I.B.A. Blackie & Son: London, Glasgow, and Edinburgh (no date).

palpably and almost studiously ignored. We are of the opinion, which we have several times before expressed, that Japanese ornament, the principal representative of this non-geometrical school, is much over-rated at present; but still it is far too important a fact in ornament to be ignored. (It is not ignored in the illustrations, but it is, apparently, in the "principles.") Besides, without going to anything so lawless as Chinese and Japanese ornament, we find even in Indian ornament, in embroidered stuffs especially, the most beautiful floral combinations which are sufficiently conventionalised to come under the head of ornament, but which, nevertheless, show little if any adherence to geometrical spacing. Again, when it is said that decoration should not be shaded to imitate work in relief, though we entirely agree that it should not, there ought to have been some recognition, by way of a note, of the fact that a large school of painted ornament in the Renaissance period, having some remarkable merits of its own, is worthy of admiration in spite of its undoubted impurity of taste in this respect. Then, in saying that some colours in different tones may be used one upon another, as light and dark chocolate, it is superfluous in any case, and not quite correct, to instance as an example of this in nature the differing tones of the fronts and backs of some leaves, &c. We do not go to natural facts such as these for authority for the arrangement of colours in decoration, any more than we go to natural sound for an authority for the combination of musical sounds. It is a question half of reasoning, half of the education of the eye, and combinations of colours may be very harmonious and very pleasing in effect in decoration, of which we do not find any examples in nature. Both the design and colouring of ornament, in fact, though in both we may receive and adopt hints from nature, are in reality matters of art, and of thought, and artistic perception,—not of imitation of nature. "The primary colours,—red, yellow, and blue," —ought hardly now to be referred to without a hint that the most recent theory has altered the conception and nomenclature of primary colours, nor is it quite safe to say that, in ornament, these so-called primaries should "always" be used sparingly, and in small quantities. This looks like a repetition of the doctrine of Owen Jones, who was very positive on this matter. It is a rule that generally may be followed with advantage, but there are and have been brilliant exceptions to it, producing very bold and fine results. Look at the masses of red in Pompeian decoration, for instance.

In giving an analysis of the various schools of decoration, Mr. Colling looks at his subject very much from an architectural point of view, and connects the changes in taste in regard to ornament very closely with the architectural style of each age and country. This is reasonable to a great extent, no doubt, and a very natural way for an architect to look at it, but still ornament, even when connected with architecture, has an independent life, as we are reminded in finding, as we sometimes do, ornaments of such very similar type in connexion with perfectly distinct and differing architectural styles. The analysis of the styles of ornament contains no new suggestions, as far as we observe, nor, we must say, is it presented in such a manner, speaking from a literary point of view, as to bring out the interest of the subject very fully; but it offers a useful *resumé* of the leading characteristics of the different styles of ornament. We observe that in speaking of Moorish ornament Mr. Colling says that the designers of this school used the primary colours on upper portions of objects, placing blue in the shade, and gold on objects exposed to light. Blue in the shade is certainly not an invariable rule, for there are specimens of Moorish ornament in which the strap work separating the interspaces, and standing in relief above them, is blue.

A chapter is given on floral decoration, which Mr. Colling made a special study of a good many years ago, and on which he speaks with the authority of one who thoroughly understands his subject. This is the most useful of all the literary portion of the book. But we must say a few words as to the practically illustrative portion of the work. The reader must not rashly suppose that because he sees the words "Greek," "Roman," &c., at the heads of the pages, the examples given are *bonâ-fide* specimens of the ornamental art of the nation indicated. They are specimens of design by the author, following the principles of the various schools of ornament named, and, in fact, embodying suggestions in regard to the further development of the types most characteristic of each class of work. This, it will be seen, is a very ambitious motive to adopt, and, at the same time, it is one of which we can hardly see the object. If the author were a young designer of ornament, working to bring himself into notice professionally, we could understand the object of the publication; but that is not the case, as far as we know. The value of the suggestions must lie, therefore, in their "suggestiveness,"—strictly speaking, in their power of setting other designers thinking on the possible development of existing types. And we fear their value in this way is not very great, and that most people who are capable at all of working out suggestions of this kind to good purpose, and to the production of anything really beautiful and original, would be more likely to do so by reverting to the original types and starting fair for themselves than by following Mr. Leighton's rather eccentric suggestions. We should be very glad to speak more cordially of the book, for it represents a great deal of work, and there is a good deal of originality of a rather queer sort scattered about the pages; but "there's where it is,"—it is mostly more or less queer, and we hardly know in many cases whether to think the author is joking or not. The author does not catch the real spirit of the styles he professes to suggest upon in some cases; certainly not in the pages called "Gothic." The book is rather amusing to turn over, and here and there we may see a suggestion which it would be worth while to turn to account in a rather better way than the author has done. But in the main we fear we must describe them as designs evincing a certain cleverness with a want of refined taste, which occasionally merges into vulgarity, artistically speaking. It must be admitted that to carry out such a scheme as this at all so as to make it of any real value would be very difficult, and would require very high powers and very cultivated taste, and these Mr. Leighton can hardly be said to possess, if we are to take these designs as a fair indication of the extent of his talent. We are disposed to think the work will be chiefly used as a sort of pattern-book by that class of ornamentalists in various departments who look out for forms ready to their hands.

PROGRESS AND PROSPECTS OF ELECTRIC RAILWAYS.

The electric railway, we hear from Berlin, is there proving to be so great a success, that it is already in contemplation to apply the same mode of moving trains to the St. Gothard Tunnel, and to the Metropolitan Railway.

With regard to the St. Gothard Tunnel, it may be presumed that the coast is tolerably clear, and that if it can be shown that electric propulsion is, all things considered, likely to prove the best and the cheapest, Messrs. Siemens, on the one hand, and the directors on the other, will thrash the matter thoroughly out.

With regard to the Metropolitan Railway, the case is different. There all the arrangements are made, and are in excellent working order. More than 400,000*l.* have been expended on working stock. Not an interval of five minutes during eighteen hours out of the twenty-four passes without a train running over the rails. Before, then, any question can be raised as to change in system here, two things are requisite. First, the electric system must be shown to be as reliable and as manageable as the locomotive system; secondly, it must be shown to be considerably cheaper.

We are not advancing this statement with the view of throwing cold water on an invention which, if fully successful, will be a success of a very high order. We are only desiring to direct into the groove of practical inquiry that energy that may otherwise be wasted in vague and profitless speculation.

As to the first point, the practical working of the line, we have nothing at the present time to say. Details will, no doubt, be forthcoming, and if they prove satisfactory, experiments will in due course follow, made on some branch line or short portion of railway, where positive results can be obtained without interfering with actual traffic. We mean, of course, in this country.

What we wish to discuss is the limit of possible advantage, or the reverse, in a pecuniary sense, to be derived from the substitution of the electric motor power for the heavy locomotives which now propel the trains of the various subterranean railways through the metropolis.

On this highly-important subject we should be able to speak with more precision if the official returns of the English railways furnished the details of work actually done in the conveyance of traffic, which are necessary in order to inform the shareholders of what part of their business does, and what does not, pay. But notwithstanding the persistent refusal of this information, we are able, by working from the details given by the directors of foreign and colonial lines, at all events to lay down certain limits within a trifle of exactitude.

The average cost of moving 100 tons of loaded train for one mile on the railways of the United Kingdom in 1879 we estimate at 20·76 pence, out of which 5d. was the cost of locomotive power alone. From the data furnished by the Blackwall Railway we arrive at the conclusion that out of this 5d. per 100 tons taken one mile, 4d. was expended in moving the locomotives, and 1d. in moving the train. This 4d. per 100 tons per mile, or approximately per train mile, is therefore the limit within which any possible saving must be confined.

On the Metropolitan lines, however, the cost of locomotive power is greatly increased by the frequent stoppages, the high speed which it is necessary to get up between the stations, and the tearing action of the brakes, alike on the engines, the trains, and the rails. We think it will be found that it would not cost more for locomotive power and maintenance to run a metropolitan train for twenty-four miles straight on end without stopping, than to run the usual stopping train from Moorgate-street to Praed-street. Thus while, owing to the good loading and the consequent low tare, the Metropolitan lines are worked at a lower percentage on their receipts than any other in the country, they cost more per mile per 100 tons than any other. The great weight of the engines, which is a necessary consequence of the high speed and numerous stoppages on the Metropolitan lines, is such as to bear a far higher proportion to the weight of the carriages than would be otherwise needful. An estimate which we made on the best data accessible in 1875 gives a cost of 45·7 pence per 100 tons per mile, or about 2¼ times the average of the English lines. For locomotive power, maintenance, and repairs, alone, the cost was 17·9 pence against 11d. on the average of the United Kingdom.

For maintenance and repairs, on the average of the United Kingdom, as aforesaid, the cost is 6·6d. per 100 ton miles of load conveyed. This is only 1·2d. per unit more than we arrived at for the Metropolitan line. We thus have a cost of 11·3d., for locomotive power and excess of charge of repairs, on which saving would be effected if it became possible to substitute the cheapest mode of applying power hitherto indicated for the locomotive. And if we take the resistance cost (or lowest ascertained cost), at 1d., there is a margin of 10·3d. per 100 ton miles out of which saving is conceivable. If we roughly allow the Metropolitan and Metropolitan District trains to average 100 tons each, load and all, a saving of 10d. per train mile would amount to more than 70,000*l.* per annum, or to an addition of 14¼ per cent. on the net profits of the two lines.

By the test of reduction to £. s. d., therefore, the conceivable saving to be effected by the replacement of the locomotive by electric propulsion is one of a magnitude well worth the attention of mechanical men, as well as of the engineers and managers of railways. Attention, of course, will be first given to those lines in which it is desirable to escape from the nuisance caused by the products of combustion. Through a long tunnel, if the passage of the locomotive could be avoided by any means that did not either reduce the certitude or increase the cost of the transit, a considerable advantage would be assured. As to the Metropolitan lines, the special cost of the sudden starting, high speed, and sudden stopping of the trains is such that the advantage of doing without a locomotive would be considerably more than on ordinary railways. There is this to be urged in favour of experiment with a view to decide these points that we have named as open, that just where the advantages of superseding the locomotives would be the greatest, the margin of possible saving would also be the greatest. That so much, or that any, saving is yet shown to be possible we do not say, for we do not know. But there is a great presumption in favour of prompt and exhaustive inquiry.

THE LATE MR. SAMUEL SHARPE.

The announcement of the death of Mr. Samuel Sharpe suggests to us many personal recollections of the laborious old Egyptologist. The comfortable old-fashioned residence long occupied by Mr. Sharpe at Highbury dwells in our recollection as one of those English homes of which our country has so much reason to be proud. Mr. Sharpe's long connexion with the old bank with which the poet, Samuel Rogers, was associated, and his immediate relationship by marriage with the family,—his wife was the sister of Rogers,—and Mr. Sharpe's great love, not alone of literature but also of art, possessing, as he did, a very thorough conventional acquaintance with its history and traditions, made his house a well-adorned receptacle of cherished memorials, not like the house of his brother-in-law in St. James's-place, not containing such famous treasures of art as that well-remembered house, but smaller objects, not necessarily of less interest because of less value, but such objects as the affectionate regard for beauty and historical interest give invariably to more than usually interesting surroundings.

Notwithstanding Mr. Sharpe's age,—he died at eighty-three, having outlived most of his beloved acquaintances, — he has left many friends to lament his loss, not alone in England, but abroad and in America, where, indeed, in certain circles his name is perhaps better known than even here. Mr. Sharpe's literary productions were numerous; his "History of Egypt" was published now more than forty years ago. His studies were almost invariably connected with Biblical literature and history, and in all instances involved an amount of laborious inquiry that his methodical habits acquired in business made comparatively easy to him.* His revised edition of the New Testament, translated from the original Hebrew, preceded by some time the recent much-talked-of edition, and to students is worthy more attention than it has so far received. Mr. Sharpe's munificent donations to the London University and School made him one of the strongest pillars of that institution, as he also was of the Unitarian denomination. His private charities and genial character made him beloved by all who knew him.

THE WATER SUPPLY DIFFICULTY.

The unusual drought of July, 1881, has been due to the concurrent causes of a very slight rainfall, and a very high evaporative power. What the combined efforts of the two have been over torrential districts (that is to say, over impervious soils, which afford no storage for rainfall), is illustrated by the portentous statement that the River Graveney, draining an area of about 8¼ square miles, chiefly of impermeable London clay, which, on the 10th of October last yielded, on an average of twenty-four hours, 9,507 cubic feet of water per minute, yields at the present time only 4 ft. per minute! We hesitate even to quote such a statement, and only do so on the responsibility of such a well-known writer on sanitary engineering as Mr. Baldwin Latham.

Mr. Latham, however, is of opinion that there is no immediate danger of a failure in water supply in the great geological water-bearing strata of the country. It is rather early days, considering the unprecedented rainfall of the last decade, to talk about running short of water after a fine July, chequered as the weather has been by heavy thunder showers in many parts of England. But Mr. Latham says that the springs are falling at a much more rapid rate than at the same time last year; and that all streams deriving their supply from surface sources are at an extremely low point. In the red sandstone formation in the central parts of England the water is abundant, but in the oolite formation round Northampton there is a deficiency. Important facts of this nature should not be left to the detection of private professional men. The mere statement is enough to show how deeply we may hereafter suffer from the absence of a scientific department which should watch and give account of the state of the natural and ever-varying water stores on which the welfare of the country depends.

Another matter of great importance in a sanitary point of view is brought forward by Mr. Latham, as to which we shall be glad to receive the testimony of medical authorities. It is the statement that "there is the strongest evidence to show that diarrhœa is produced by the use of water at a temperature of 62°." As a simple statement, we apprehend that the above sentence, as it stands, is incapable of defence. But that it may include, or point to, a truth, seems to us to be indicated by the experience of Mr. Aitken, who opposes the statement of Mr. Latham. We doubt very much whether there is so large a use of water made for drinking purposes as is assumed; that is to say of water as drawn from the cistern. Between the use of beer and other artificial beverages on the one hand, and that of boiled water on the other, we should think that the drinking of simple water at 62° was the exception rather than the rule. However that may be, it is possible that, although the temperature of the water drunk is indifferent to the consumer, the rise of the temperature of masses of water to a given height may be accompanied by an indication of fermentation, confervoid growth, or some other induced condition unfavourable to health. And this, no doubt, is intimately connected with the character of the gathering grounds. At the Bombay Waterworks, says Mr. Aitken, "no men or animals are allowed to live on the gathering grounds, and there is no diarrhœa attendant on the consumption of the water." Nor is it a mere matter of expression with which we have to do. Mr. Latham holds that in those districts of the country which take their supply direct from wells, the water of which is of a low temperature at this season of the year, diarrhœa does not become epidemic. Mr. Aitken, on the contrary, holds that the prevalence of diarrhœa in a part of London supplied by the Kent Waterworks is due to the use of impure water from wells. Our own view, on the first aspect of the case, is that temperature, as such, is wholly unimportant; as, for instance, if boiling water be added to pure ice till a temperature of 62° is obtained, we should expect the water to be perfectly wholesome, though tepid to the palate. On the other hand, that impurities contained in either well or river water may develop a poisonous activity with a given rise of temperature is quite conceivable, and any good observations on that point will form a valuable addition to our sanitary science.

As to the remarks which we made with reference to the extra stress thrown upon some of the metropolitan water companies by the hot weather, they have received a very full confirmation from a letter written by Messrs. Joseph Quick & Son, of 29, Great George-street, Westminster, who write as having been for many years officially connected with the management of an important portion of the London water supply. During the year ending the 30th of June, 1881, the average daily supply of London has risen to 145,732,116 gallons. But during the month of June, the supply actually reached 162,305,736 gallons per day, or nearly 20 per cent. above the yearly average for 1877. As compared with the daily supply of last December, the supply in June shows an increase of 27,594,892 gallons, and the supply of one of the West-end companies on the 20th of July reached the extravagant and wasteful amount of 45 gallons per head of the population of the district for that day.

These facts do not more thoroughly substantiate the remarks we made on the subject than do the experience and candour of the writers support the opinions we have so often expressed as to the points where the main evils in the present system are to be detected. "The public have yet to learn," say Messrs. Quick, "that not only the suppliers, but also the recipients of the water, have essential duties to perform in connexion with the supply." The Parliamentary powers of the companies are not such as to allow of such adequate inspection on their parts as should prevent either waste or negligent and unsanitary pollution of the water in the house-cisterns; which, as a rule, are to be found in those very parts of the houses from which they ought to be as far as possible removed. "Things must, therefore, take their course until a metropolitan water authority is created, armed with sufficient power to act vigorously in the organisation of domestic and other water supplies, and compelled to exert its authority stringently, in order that the entire population may realise the full advantages of the supply, and no one be allowed to prejudice his neighbour's water rights by abusing his own."

The last sentence of this instructive letter might almost have been copied from our own columns. "The recent accident to the main of the Grand Junction Company which resulted in so much inconvenience to the tenants affords an apt illustration of the disadvantage of the present system, and of the advantages which would result from unity of management, and amalgamation of the various companies' works; for under the latter arrangement connexions could be made between the various works, and the mains of one district would be available for the supply of another in cases of emergency."

THE TRADE IN INFERNAL MACHINES.

Amid the unmitigated detestation which has been excited by the discovery of the long-laid plans of murder which have been brought to light from the holds of the *Malta* and the *Bavarian*, there is at least one ground of satisfaction. So far as is yet known, no British workman has been found ready, for any bribe, to lend his honest skill to the service of wholesale murder. That in so dense a population, where engineers and men of mechanical knowledge are relatively so numerous, and when trade, including their trade, is so slack, this is, indeed, matter for no small congratulation. Considerations of personal safety, indeed, may have induced the cowardly purchasers of these infernal machines to procure them in a foreign market, rather than to attempt to tamper with, or even to outwit, a needy English mechanic. But this supposition very little alters the aspect of the case. Whether the sneaking conspirators against society tried and failed to procure tools for their nefarious designs on English soil, or whether they were afraid to try, comes to much the same thing, as far as the credit of the English mechanic is concerned. Long, long may it remain so!

It can scarcely, we fear, be doubted that the events of the last eighteen months have but too much familiarised the public of these kingdoms with the accounts of deeds of murder, arson, and mutilation. The reprobation which is felt for such crimes is not less in any upright mind. The kind of horror which each new instance elicits may be less marked, but only so because the sense of surprise arising from utter novelty is dimmed. And while this is the case more or less with the best of us, what is likely to be the effect on the more ignorant and dangerous classes? No ugly phenomenon is more certain than the fact that crime, and more especially prodigious crime, tends to produce crime. It is as with some noxious weeds, which fill the neglected soil with their self-sown seedlings. One of the great arguments against public executions was the manner in which the visible exercise of violence against human life brutalised the spectators. The worse, rather than the better, elements of our nature are galvanised into abnormal exercise by sights of violence. And it is, in the same way, although (as Horace long ago pointed out in a less vivid manner), that the recounted details of crime tend to dull the sense of horror.

How the intelligence was brought to the ears of the Home Office, those who best know will be the last to tell. It is a matter for satisfaction that, as far as the *Malta* and the *Bavarian* are concerned, the news was given in time. But none of us ought to forget that the cunning of the murderers, shown by the actual despatch of two cargoes of barrels of cement, each containing a deadly consignment, marked by an inconspicuous sign, is hardly likely to have been detected in a first essay. It will be well to ascertain at Liverpool, at London, and at our other ports, whether consignments of cement, or of any articles out of the usual course of trade, have of late been received from America. As to the search that should be made for the consignees, it is needless for us to insist upon that.

The discovery of this diabolical plot, and more than a plot, as it involves the carrying out of the murderous design through the two distinct stages of the construction of the machines, and of their despatch to Liverpool, leads us to repeat the warning which we gave on the occasion of the less deliberately-prepared outrage at the Mansion House. It is this. In times of public danger,—and that we live in such times who can deny?—it is the duty of every good citizen, of every honest man, of every observant lad, to act as a self-constituted detective on the part of society. As a rule, it is almost impossible for

* Only as lately as to the *Athenæum* of July 16 last, Mr. Sharpe had contributed an interesting letter claiming for the Egyptian astronomer Ichonuphys the invention more than 300 years before the Christian era of the Leap-year.

any great mischief to be prepared without some sign. Something unusual is almost certain to occur: something to betray to the experienced eye an irregularity, an incongruity,—a need for explanation. The despatch of an article of the low value of cement from the United States to Liverpool was a case of this kind. To nine people out of ten no ground of suspicion would hence arise. But to the cement maker or seller, to the builder, the architect, the shipper, the carrier, the question would naturally occur,—"How is it that cement is consigned to Liverpool from the United States?" And with one or more of these specially informed people the consignment was sure to come in contact. "Who," they might ask, "is the consignee? What has he to do with American cement?"

This, of course, is easy to say now. But the need of vigilance cannot be too much insisted on. And as encouraging the watchful it is that we call attention to the unconscious warnings that treason is so wont to give. A spider's web saved the Bruce. The keenness of observation and inference that argued from the presence of the web that the cave was empty, was at fault in that memorable instance, as is usually the case when slight indications are relied on with the result of saving trouble. On the other hand, when a true and anxious vigilance is awake, no hint so slight but that its careful pursuit may lead to the saving of valuable life,—to the safety of a vessel or of a public building.

Since we wrote the above, it has been stated in the papers that "cement" had been received from America at Liverpool before the arrival of the *Malta* and of the *Bavarian*, and landed without examination. The strong effort which has been made to show that these deadly consignments were only intended as a scare, should be read by the light of that statement. Vigilance is imperatively demanded. The consignments which have actually passed the Custom House ought easily to be traceable by the police.

New York papers of the 29th of July state that a reporter of the press claims to have discovered that the infernal machines seized at Liverpool were made at Peoria (Illinois), and accuses the director of the Association of United Irishmen residing in Peoria of being connected with the conspiracy.

THE ABBEY YARD, WESTMINSTER.

Those, if such there be anywhere, who are contented with the present squalid and indecent state of the churchyard of St. Margaret's, Westminster, and of the dreary swamp (in wet weather), half paved with dishonoured gravestones, which form the foreground to the prospect of Westminster Abbey, as viewed from the north, will not be found among our habitual readers. That an effort is being made to remove this discreditable eyesore all persons of taste will rejoice. Our first suggestion must be not to overdo it. As to this, the very modest sum now asked from the public, 2,000*l.*, to place alongside an equal contribution already promised, is to some extent a guarantee against too much decoration. The great points to be borne in mind are, walls that shall protect without disfiguring, the area included, and sweep of fine turf, relieved, but not overshadowed, by shrubs, and sparkling, here and there, with flowers. We very much doubt whether evergreens should be planted in the area. Amid the dense impurities of the London air, vegetation that springs new from the soil in spring, and that fades before the alternating frost of winter, has a great advantage over permanent shrubs and trees, that are ever adding to the incrustation produced by the smoke and other products of combustion, on their trunks and limbs, and that never shake off the sickly paint. This, of course, is mostly the case with those very trees of which the appearance is the most picturesque in the winter. It is also the case with our forest trees,—the elm, the beech, the oak. It is true that they assert their own chartered rights to display lovely and tender foliage in the opening year. It is true that the leaves do not become wholly black before they would otherwise become brown. But the trunks and branches do. Large trees are not at home in London, nor likely to make themselves permanent guests, until we lessen the smoke. Even in the beautiful grounds of Chiswick House, where an area of real park yet resists the flood of cottage building that surges round the ducal boundary, the old cedars and pines are fading. The highest botanical authority in the country is under the apprehension that the decay cannot be arrested, and that trees on which Linnæus looked with admiration are yielding to the slow poison of the London atmosphere.

For trees, then, if trees must be had to relieve a broad sweep of turf with a bold hedging of shrubs, we recommend the landscape gardener of Westminster to study the best forms of the larch. This tree shares with the pine the advantage of bearing needle-like leaves, less likely to contract atmospheric contamination than the broader, softer, and more destructible foliage of our deciduous forest trees. And as it sheds its spines in the winter, it is likely to preserve greater foliage and vigour than any of the evergreen gymnosperms.

It is to be regretted for many reasons that the culture of the yew is now so much neglected. The yew is indigenous to the chalk downs of England. Its slow growth renders it so unproductive as a timber tree, that its encouragement, when England depended on the bow for defence, was made the subject of legislative action. Hence the presence of the yew in so many churchyards. With regard to the influences of London smoke on the yew, we cannot speak so definitely as we could wish. That the tree becomes frightfully black when growing near large centres of smoke, we well know. That it may preserve its vitality, in spite of its griminess, is possible. The juniper is another indigenous evergreen of extreme beauty. But we imagine that the juniper refuses to live in towns. The most graceful of this group of shrubs, the tamarisk, certainly does. We commend to the expert the question of larch, yew, or juniper for plantation in this venerable God's acre. We hope by next year to see level and well-shorn turf, and small beds of brightly-flowering plants,—no carpeting or formal "bedding out,"—covering a site so rich in proud memories, and now such a disgrace to the metropolis.

THE "SEBASTIAN DEL PIOMBO" OF THE NATIONAL GALLERY.

We spoke not long since* of our confidence that, in the hands of the present Director of the National Gallery, the "Sebastian del Piombo" would not be likely in the course of its restoration to receive the smallest injury. We were delighted, on visiting the Gallery the other day, to find our confidence fully justified, the grand old picture revealing more than ever its brilliant power and beauty. The "Raising of Lazarus" is not the only picture in our national collection that has gained much by the attention bestowed on it during the careful custodianship of Mr. Burton, and it is impossible, when we see the admirable condition of so many of our pictures and the care and thought bestowed upon them, to resist a comparison with the state of many of the great treasures of the national collections abroad. It may be that there exists a conviction in the minds of Continental custodians that it is dangerous to meddle in any way with treasures such as they possess, and we cannot but sympathise to some extent with this fear. At all events that appears to be the only excuse for the look of decay, of decomposition even, that appears in progress on the surface of several pictures in the collection of the Louvre, notably in the rare and famous picture the "Fête Champêtre," by Giorgione, in the "*Salon Carré*." This picture presents a crumbling and slightly shrivelled appearance, the very reverse of what some people object to in the condition of our pictures, of being over-varnished.

There exists, it cannot be denied, a thoughtless, and, in some measure, a species of traditionary, system of decrying and abusing all restoration. Restoration in the case of old pictures, as of our great monuments, is absolutely necessary to preserve them from certain destruction in a more or less distant future; restoration, that is, of a preservative nature. It is to the care of the Louvre authorities that we owe the preservation, the very existence almost, of the "Marriage of Cana" by Paul Veronese. This picture, one of the first Napoleon's spoils from the Italian campaign, was in too dilapidated a condition at the time of the restitution of the rest of the Paris treasures to their respective countries, to make it worth while for the Austrians to transport it back to Venice. The huge canvas was, in fact, what the French understand by *hors de service*, and for forty years it remained in this state. Some years since the Louvre authorities boldly undertook the task of re-lining the ragged picture, and now the "Marriage of Cana" shines out, as it will for many a generation to come, the most brilliant item of the jewel-case of the French national collection. This we owe, as we do in many other cases, to intelligent restoration conducted under the eye of competent directors.

IMPROVEMENTS AT IPSWICH.

NEW LOCK GATES, POST-OFFICE, AND MUSEUM AND SCHOOL OF ART.

Ipswich was *en fête* on Wednesday in last week on the occasion of the opening of the new lock-gates, the new Post-office, and the new Museum and School of Art.

The Lock Gates.—The Ipswich Wet Dock, to which the new locks are constructed to give improved access, dates its existence from the commencement of the reign of our present Sovereign, the first Ipswich Dock Act, under which Dock Commissioners were elected, and powers given them to make a dock, having received the royal assent on June 30th, 1837, during the early days of her Majesty's reign. It is now about ten years since the desirability of constructing a larger entrance began to be considered. The subject first came up at the general meetings of the Commission till the General Committee of Management were instructed to give their attention to it. At the July meeting of the Commissioners in 1872 the committee first reported in favour of a new lock entrance, which they suggested should be from 250 ft. to 300 ft. in length, 50 ft. to 55 ft. wide, and with a depth of 25 ft., subject to the advice of an engineer. They recommended that Mr. J. F. Bateman, C.E., F.R.S., should be consulted. Their report was adopted, and the chairman of the committee (then Mr. J. C. Cobbold), Mr. G. Mason, and Mr. R. C. Ransome, were appointed a sub-committee to confer with Mr. Bateman. In the following October Mr. Bateman submitted a comprehensive report, in which, after reviewing the past history of the port, and, considering its then condition, he sketched out a plan of works which he was of opinion would convert the dock and harbour of Ipswich into a first-class port. He proposed a new lock 300 ft. long between the gates, 50 ft. wide, and with a depth of 23 ft. 6 in. at high water spring tides, which is the work now completed, and in addition he proposed, acting upon a suggestion from Mr. George Mason, an embankment, with weir and sluices, across the southern end of the New Cut, which would give an additional dock area of nearly 20 acres, and, with a swing-bridge over the lock entrance, afford an opportunity for increased railway communication by means of the present line to the Griffin Wharf. He also suggested improvements in the channel of the river, and his total estimate, including 10 per cent. for contingencies, was 109,560*l.* A portion of these works, it was clear, could not be constructed at once, for a great deal of the sewage of the town was daily passing into that portion of the Cut which it was proposed to dam up, and Mr. Bateman's proposals having been referred to the Committee of Management, that body recommended, in November, 1872, that if 60,000*l.* could be raised, it was expedient to apply to Parliament for powers to construct a new entrance lock. Opposition to the scheme caused it to remain in abeyance until September, 1875, when Mr. Thomas Miller, C.E., the Commissioners' resident engineer, suggested a modification of Mr. Bateman's plans by placing the proposed dam across the Cut above the present lock-gates, with gates to connect St. Peter's Dock with the dock, and, after consulting Mr. Bateman, the committee adopted Mr. Miller's proposal, and recommended application to Parliament for powers to carry out the whole scheme so modified. This report was adopted, after three hours' discussion, by a majority of one,—twenty to nineteen, and the usual Parliamentary notices were given. At the July meeting in 1876 the committee recommended the construction of the lock entrance and other works, the Corporation being asked to guarantee the payment of the interest. The report was adopted by a large majority,—thirty-one to eight, and the Corporation subsequently agreed, under conditions, to give the guarantee asked for. Application was made to Parliament in the ensuing session, and the Bill met with no serious opposition, but when it came before the

House of Lords the Chairman of Committees, Lord Redesdale, refused to sanction the clause containing the Corporation guarantee, and that part of the Bill had to be abandoned. That, however, was not allowed to extinguish the enterprise which has now been carried so far towards completion. The Bill empowered the borrowing of 80,000*l.*, secured upon rates to be imposed on all goods imported or exported, of which 50,000*l.* has been raised, to be repaid within eighty years. That portion of the works, the completion of which was celebrated on the 27th ult., consists of the lock entrance, and the works necessary to enable it to be used. The lock, as we have already said, is 300 ft. long between the gates, and it is 403 ft. over all from pier to pier; its width is 50 ft., and at high water on an ordinary spring tide there is a depth over the cill of the gates of 23 ft. 6 in. The approach from the river to the lock, for about a quarter of a mile, has been dredged to a depth of 22 ft. at high water spring tide, and will be further deepened in course of time, but the full benefit of the increased depth at which the cill of the new lock is laid will not be felt until the river for a distance of about three miles down has been dredged to a corresponding depth. At present the upper part of the river is adapted to vessels drawing 18 ft. of water, but at Butterman's Bay, where larger vessels have been in the habit of lightering, and where heavy moorings and buoys have been laid down for their accommodation, there is a depth at low water of 22 ft. A deepening of the dock is also in progress from the new entrance upwards, so as to give 20 ft. of water at neap tides, which is a considerable increase, for the depth of 17 ft., recommended by Mr. Palmer, has only been attained over a small portion of the dock within the last seven years. This deepening will be gradually extended throughout the whole length of the dock, so as to admit of the safe discharge of the largest vessels within working distance of the quays. A new dredger, the *Lady Nancy* which is capable of dredging to a depth of 26 ft., has been purchased, and, along with the Commissioners' old dredger, is engaged with double gangs of men in carrying on these works as fast as possible. The contractors for the new entrance have been Messrs. Henry Lee & Son, of Westminster, whose accepted tender was 45,000*l.*, and we are informed that the extras are comparatively small. The first pile of the dam within which the works were constructed was driven on the 6th of June, 1879, and the date fixed for completion was the 1st of June, 1881, but the contractors obtained an extension of time. The work was practically completed on the 23rd of June, when the water was let in and the gates were tested and found to be perfectly water-tight. The total quantity of soil excavated amounted to 35,000 cubic yards, and when this had been removed there was about 17,000 yards of concrete laid, and about 2,400 yards of brickwork, or, roughly speaking, about a million bricks. The quantity of stonework was also considerable,—about 1,700 cubic feet of Cornish granite, which was used for the cills, hollow quoins, and other important parts of the work, and 18,000 ft. of Bramley Fall stone. Considerable difficulties (says the *Suffolk Chronicle*, from which journal we condense these particulars), were met with in regard to these foundations. There was an immense influx of water from the gravelly stratum overlying the chalk, as well as from occasional chalk springs. For many months it was necessary to keep a centrifugal pump in constant operation, and while the work was going on in the lower trenches the water lifted and daily discharged into the dock beyond the dam was no less than 5,000,000 gallons. Besides the difficulty arising from so large a flow of water, there was a further difficulty from the nature of the chalk, which was found almost throughout at a few feet above the intended foundation level. The chalk was so much comminuted that it became very little better than whitewash, and would frequently prove insufficient to support the weight of the men working in it. The contractors adopted the expedient of covering the worst part with bags of concrete, which pressed out the water so as to allow the chalk to reconsolidate and support the concrete in mass which was laid above. At other parts clean gravel was used for a similar purpose. As soon as these difficulties were surmounted the walls were rapidly erected. They have been built of concrete in mass and faced with hard brick: the floor of the lock chamber, which is in the form of a shallow invert, was laid in concrete. The works were so designed that the whole of the excavated material should be absorbed in the making of concrete and in the backing up of the quay walls, and this balance would have been effected but for the occurrence of the soft chalk, and the commissioners have supplied extra gravel to make up the deficiency. The framework of the gates, that is the three lower ribs, the top ribs, and the heel and mitre posts, are of greenheart. The remaining portion of the gates is of Baltic fir, so much of it as is below water being covered with creosoted boarding to protect it against the sea worm *teredo*. Each gate is provided with two sluices, and there are hand-power crabs for opening and closing them. Narrow bridges are provided for the crossing of foot-passengers along their tops. Provision has been made for the putting of a third pair of gates, closing in the opposite direction, against the river, for the purpose, in conjunction with the proposed dam across the New Cut, of shutting out abnormally high tides such as occasionally flood the quays and lower parts of the town, but for the present these will not be constructed, nor will the swing bridge across the lock, for which foundations have been laid, and which, when the dam across the New Cut is constructed, will enable a railway to be carried from the Griffin wharf branch of the Great Eastern line round the south end of the dock. Mr. Bateman's designs also included the construction of a timber jetty at the southern end of the lock entrance to protect the works and give warping facilities, but there is a diversity of opinion as to the necessity of this, and it will probably stand over till experience decides the point. In order to admit of the safe approach of vessels from the river, seven heavy moorings are being laid down at the entrance to Cliff Bight, with large buoys. Such are the works which Messrs. Lee & Son have for the past two years been carrying out, their representative at Ipswich having been Mr. Bispham. The works have been throughout under the superintendence of Mr. Thomas Miller, the resident engineer of the Commissioners.

The New Post Office.—Of this new building, which includes, besides the post-office proper, a set of offices occupied by the School Board and other public bodies, we gave a view and plans little more than a year ago.* The architect is Mr. John Johnson, of Queen Victoria-street, London, whose plans were selected out of twenty-two competing designs by Mr. Chas. Barry. The building has been erected by Messrs. D. C. Jones & Co., of Gloucester, Mr. G. J. Farrow being clerk of the works. The style of the building is Italian, and the Cornhill and King-street fronts are in Portland stone, the other two sides of the building being in white brick. In the Cornhill front, which consists of ground and first floors, there is a bold portico supported by eight columns, and surmounted by four figures in a sitting posture, representing Industry, Electricity, Steam, and Commerce, each figure being accompanied by appropriate emblems, which indicate with more or less distinctness the character it is designed to sustain. The public entrance to the post-office and also the letter-box for the reception of letters are beneath this portico. The opinion prevails locally that the one defect in the design is the number and steepness of the steps which lead up to the boxes. They are six in number, and much steeper than the steps up to the Town-hall. Between the windows of the first-floor, in front, are pilasters, above which are four ornamental terminals, and, in the centre, a handsomely-carved representation of the royal arms, supported by the recumbent figures of Genius and Science, which certainly very aptly represent the services which Sir Rowland Hill and Professor Wheatstone have rendered to our postal and telegraph system. In the carved heads of the first-floor windows of this front there are heads of Vulcan, Minerva, Mercury, Ceres, and Pluto, and the arches of the ground-floor windows at the angles on each side of the portico have similar carved keystones representing Jupiter and Neptune. On the King-street side of the building the windows on the ground-floor have carved jambs, cills, and heads, and the wall-space below them, which, owing to the fall in the ground, is considerable, is relieved with highly ornamented carved panels. The keystones of the window arches are carved with characteristic heads to represent Europe, Asia, Africa, America, and Australia. The first-floor windows are plainer in character, but there is a richly-carved frieze in the entablature above. The carving was the work of Mr. Baird, of London, and the sculpture is by Mr. F. W. Woodington.

The Museum and Schools of Art.—These buildings occupy the ground which was for many years kept vacant with the idea of building a church in it for a portion of St. Margaret's parish,—the site having been generously offered to the Museum Committee by its owner, the Rev. E. Hollond, when the project for a church was finally abandoned, at the price at which he originally purchased it. A more eligible site could hardly have been obtained, unless by the purchase of valuable property in the centre of the town, and the buildings, which have been erected from the designs of Mr. Horace Cheston, A.R.I.B.A., of Great Winchester-street, London, are well suited for the purposes for which they were intended. The plan of the structure is arranged in three blocks, the central block being recessed, and a terrace placed in the recess, from which there are separate entrances to each block, the central doorway opening into the main entrance-hall, and the two side doorways at the end of the terrace into paved corridors. The style of the building is a free treatment of the English Renaissance of the Stuart period, and the front elevation is relieved with ornamental panels in terra cotta, as well as with piers and pilasters of moulded and rubbed brickwork. The panels beneath the first-floor windows display festoons of fruit and flowers, and these run round three sides of the building; there are also small panels above the pilasters, filled in with representations of various fossils illustrating the different geological periods, these having been designed by Dr. J. E. Taylor, the curator, and executed, as was all the terra-cotta work, by Messrs. Doulton, of Lambeth. Other panels in the north and south gables are filled in with conventional dragons and foliage, and with portrait heads of Newton and Hogarth. In the panels in the centre gable are symbols of Science and Art, and these words are emphasised in arabesque panels over the windows within the terrace on each side of the main doorway. The central or main building and the southern wing are devoted to the Museum and Public Library; the northern wing is occupied by the Science and Art Schools. Entering by the main entrance, the visitor finds himself in a spacious entrance-hall, 33 ft. by 18 ft., whence he may advance to the central-hall of the Museum, ascend the handsome staircase to the first floor, or proceed by the corridors to the public library in the south wing, or to the rooms of the science school in the north wing. The central museum is a handsome room lighted from the ceiling, with a floor space of 2,350 square feet, being 71 ft. 9 in. long by 33 ft. wide. There is a broad gallery round the hall, 14 ft. from the floor, which thus doubles the accommodation for wall cases. This gallery is supported by substantial iron columns, to which an appearance of lightness is given by their being painted in two shades of green, and by the use of ornamental brackets. The upper room in the south wing, to which access is gained either from the landing or by glazed doors from the gallery of the central hall, is also a fine room. It extends the whole length of the wing, 103 ft., and is 25 ft. wide, and it is, therefore, the largest room in the building. It is 22 ft. 6 in. from floor to ceiling, and is flooded with light from the south and east sides. The ground-floor of the south wing is divided between the public library and a room for use by the curator and for committee meetings. The library is a spacious room, 76 ft. by 25 ft., and 16 ft. high, with a richly-panelled ceiling, and moulded and dentilled cornices. The north wing, devoted to the Science and Art Schools, is cut up into smaller rooms. The science school is on the ground-floor; a science class-room, 40 ft. by 20 ft., and a science master's-room, 18 ft. by 12 ft. 6 in., as well as a laboratory, are provided, and this wing also includes porter's-room, general cloak-room, lavatory, store-rooms, &c. The Art School is upon the first floor, the art class-room being 72 ft. by 25 ft., divided by movable partitions, special arrangements being made for the lighting in accordance with the requirements of the Science and Art Department. The work has been carried out by Messrs. J. B. & F. Bennett, and Mr. R. T. Orr has acted as clerk of the works. An interesting paper on the history of the Museum was read during the proceedings by Dr. Taylor, the Curator.

* See *Builder*, vol. xxxviii., pp. 735, 737.

ANCIENT CHURCHES IN BEDFORD.

ROYAL ARCHÆOLOGICAL INSTITUTE.

As mentioned by us last week, the Royal Archæological Institute has been holding its annual congress in Bedford, which has now been visited by the Institute for the first time. After the luncheon which followed the address of the President of the meeting (Mr. Magniac, M.P.), a considerable number of the visitors proceeded to St. Paul's Church, under the guidance of Mr. J. Day. After spending half an hour here a perambulation was made to the site of the Castle, through the premises of Mr. Wells, who had laid bare a considerable length of the Castle wall for the inspection of the visitors. Thence a visit was made to the "Mound,"—now the Swan bowling-green,—and then to St. Mary's Church, where the rector, Rev. Canon Brereton, acted as guide, and Mr. M. Bloxam also offered a few remarks. The next spot visited was the monastery of the Grey Friars in Priory-street. Several of the visitors also gave opinions respecting different portions of these interesting remains, after the inspection of which the company made their way to St. Peter's Church. Here Mr. St. Aubyn, the architect under whom the recent additions were made to the church, by the aid of a series of drawings, greatly interested his auditors, and under his direction inspection was made of the discoveries effected during the work. The last object in the perambulation was the old George Hotel, in the High-street.

The sectional meetings commenced directly after eight o'clock, in the Bedford Rooms, when Mr. R. S. Ferguson presided over the Antiquarian Section, and a paper was read by Mr. M. H. Bloxam on "Chaucer's Monument in Westminster Abbey." The paper was full of interesting facts, and showed that Mr. Bloxam's researches had been of a most laborious character.

Afterwards the Architectural Section met under the presidency of Mr. Bloxam, and the following paper was read by Mr. J. Day on

St. Paul's Church.

The very earliest records of a church in Bedford are to be found in Domesday Book, where it is stated that "In King Edward the Confessor's time (1041-1064) Bedford was rated at half a hundred, and it still contributes at that rate towards expeditions either by land or sea. The land of this town has never been computed by hides, except one hide which in King Edward's time belonged to the Church of St. Paul's in Alms, and it still properly so belongs; but Bishop Remigius took it away from the Alms land of St. Paul's unjustly, so the Jury say." In King Edward's time (1041) Osmund's land was worth ten shillings, and Ansfrid's three shillings; at the time of the Conquest (1066), valued at the same, and also at the compilation of Domesday (1086) the same. This evidence establishes the fact that there was a Saxon church in Bedford dedicated to St. Paul. The late Mr. Wyatt was always of opinion that there was a Saxon church here which was destroyed by fire, and he thought many of the wrought stones found in the old steeple when it was taken down in 1864 belonged to the Saxon church; he had an idea also that they retained traces of fire. It is quite certain, however, that some fragments of Norman work, no doubt portions of the arch of the north transept of the Norman church, were found; for when the work of demolition had reached within 10 ft. or 12 ft. of the ground, these stones were discovered, together with the Norman respond, which had never been taken down, but simply encased by the Early English builders with their own work. This is sufficient to prove that the Norman church was not wholly destroyed in the reign of King John. These stones are now preserved in the churchyard. In excavating the ground for the new north transept, also, the workmen came upon some of the old foundations, as they termed them, which proved to be a portion of the walling of an earlier building, and appeared to be either Saxon or very early Norman work. From the character of the moulded stones now preserved, I should think the Norman church was of considerable architectural beauty, and the date of the erection very early in the twelfth century, if not previous to that. Doubtless it was of the orthodox cruciform plan, with central tower, nave, transepts, and choir terminating with an apse. History records that it was a collegiate church, and that between 1148 and 1170 the prebendaries of St. Paul's were changed into black or regular canons and removed to Newenham, in the parish of Goldington, by Simon de Beauchamp, in accordance with the wishes of his mother Roisia, wife of Paganus de Beauchamp. Simon de Beauchamp was buried here in 1208, and the slab which covered his grave is still to be seen in the chancel of the present church. Leland says of it:—"Simon de Beauchamp lyeth afore the High Altar of St. Paul's Church in Bedeford, with this Epitaphie in bras, and set on a flat marble stone—'Under this stone lyeth Simon de Beauchamp, Founder of Newenham." This, which was the earliest known English brass, disappeared long ago. In 1878-79 the north and south walls of the church were opened up with the present arches, and a clearstory added, and in taking down the south wall, two portions of figures were discovered built in the old wall. It is conjectured one is a portion of the effigy of one of the Beauchamps, probably William de Beauchamp, to whom King Henry granted the site of the castle after its demolition. The figure was no doubt recumbent in a recess in this wall. In the history of Bedford Castle we read that in the reign of King John, A.D. 1216, the Collegate Church of St. Paul was pulled down to rebuild and fortify the castle. It is quite certain, however, that the church was not entirely demolished, but that sufficient material for the fortification having been obtained, some considerable portions of the walls were left standing, more especially the walls of the tower and other solid portions, and so most of the monuments and tombs would remain untouched through their being covered with small stones and rubbish. The church was in ruins for from eight to ten years, for we learn from the history of the castle that King Henry III., after he had reduced the castle and ordered it to be destroyed granted a portion of the old stones to the monks of Newenham for the reparation or rebuilding of St. Paul's Church. This brings us now to the history of the present building, which is the church referred to as being rebuilt in the thirteenth century after the demolition of the castle. I have no doubt it was rebuilt upon the Norman foundations; in fact, the old tower walls were not pulled down to the ground, nor scarcely any of the walls of the other parts of the church, and when rebuilt the old Norman arches of the tower were taken out by the Early English builders, the jambs cut away so as to widen the openings, the arches were then sprung from the jambs, the opening into the north transept on the north side of the tower was contracted on one side and the respond of the Norman arch built in, and it remained until this old Early English steeple was pulled down a few years ago. As I said just now, the Early English church was built on the foundations of the Norman church; at the same time also the additional nave, together with the south chancel, or what is now called the archdeacon's court, was also added to the plan. This necessitated the re-erection of the south transept to connect the south chancel with the new south nave. The old Norman north transept was not rebuilt; nearly all the walls of the present church are therefore Early English. I have reason to believe that the Norman and Early English chancels were somewhat longer than the present chancel, for one can plainly see that a portion of the piscina has really been built in with the present east end, and just above can be seen one of the corbel stones which no doubt received the jack-leg or wall piece of a former roof; this shows that the chancel must have extended beyond the line of the present east end; the windows north and south of the altar also are unusually near to the east end. Possibly the lady-chapel may have been eastward also of the high altar. I am not at all inclined to think that the Early English church was equal in any respect to the Norman church, neither do I think it was used wholly at that time nor at any subsequent period until this last restoration. The addition by the Early English builders of the south nave and chancel made a kind of a double church of it, but for what purpose this was done can only be a matter of conjecture. I should say in all probability it was built for and used as the chapel of the Trinity Brethren, one of the religious orders in Bedford at that time. From the immense length of the nave and chancel, with a central tower intervening resting upon immensely solid masonry with very low arches, I cannot imagine how the whole of the church could be used: a separate service must have been held in the chancel. From what I have seen lately, during the alterations in the chancel, I should say the south wall of the chancel was nearly all Norman work, for in carrying up the walls of the clearstory I found a considerable difference both in the thickness of the wall and quality of the masonry. I am quite certain, therefore, that in this case the Norman wall was not pulled down entirely; subsequently (probably in the latter part of the fourteenth or early in the fifteenth century) this wall was pierced with two openings, the responds and arches of which were something similar to those of the nave, the caps and bases being of a much later date. I think it was to make room for these openings that the effigy of the Beauchamps was removed and built in the wall as near to the place it was taken from as possible, as it was found in the respond of the westernmost arch. No very material alterations were made to the church in the fourteenth century beyond the insertion, in the north and south walls of the nave, of four-light windows similar to that which now remains in the north wall, together with the insertion of the south and west doorways, the rebuilding of the west end entirely, together with the strengthening of the buttresses, which, previously to the insertion of the four-light windows, were very slight. The upper stages of these Early English buttresses are now visible, those of the latter period being simply added on to the earlier ones. The north and south windows in the chancel were also inserted at the time, the chancel remaining the same length as in the Early English time. It was not until late in the fifteenth century that any further extensive alterations were made in this building, but at that time the character of the church was materially altered; the clearstory was added to the two naves, which necessitated heightening the piers and lifting the arches. The north and south porches, with the parvise over the south porch, were also added, the chancel contracted to the line of the present east end, and the vestry with the sacristan's room over was also built. The windows in the nave were filled up, and the three-light Perpendicular ones inserted, together with the two west windows. Upon a minute examination of the south porch, much interesting work may be seen. I refer to the handsome groined and canopied niches, containing figures of St. Peter and St. Paul; the detail of the embattled parapet is also very good. The doorway is the depressed four-centred arch of the fifteenth century within a square head with a hood-mould over; the west spandrel is filled in with a portcullis and the east with a shield, and what is apparently a ragged staff, which has the peculiarity of being minus the usual Bear of the Earls of Warwick. It is quite possible that Thomas de Beauchamp had something to do with the building at that time. The chancel walls and the walls of the south aisles were also raised in the fifteenth century; the chancel has the original fifteenth-century roof, which was repaired in 1848. At the same time, also, the nave roofs were entirely renewed, the figures and enrichments being all that remain of the original roofs of the two naves. At the time the clearstory was added to the chancel the roof was not taken off, but raised bodily with screw jacks, and underpinned until the proper height was attained and then re-leaded and made good; the present roofs of the nave are an exact copy of the original. It is worthy of notice that although the two roofs are apparently similar to each other, yet upon minute examination they will be found to differ materially, for one has tie-beams and principals alternately and the other has all tie-beams. There were some interesting old fifteenth century parcloses in the openings between the two chancels, but I am afraid these were destroyed in 1848 to make room for more modern screens. I am happy to say, however, that the old rood-screen is still in existence, although sadly mutilated, but there is enough of it left to enable one to thoroughly restore it. Mr. George Wells has kindly undertaken to store it for the churchwardens until funds can be obtained for its restoration. The stone pulpit standing at the north-east angle of the Archdeacon's Court is the ancient fifteenth-century one, and was, I believe, originally fixed against the easternmost pier of the nave arcade; Lysons speaks of it as "being ornamented with gilt tracery upon a blue ground." This is the pulpit in which John Wesley preached his celebrated sermon, "The Great Assize." The church, one can plainly see, did not escape the mutilation which took place in the Commonwealth, but suffered as much, or I may say more, than many others. In 1864,

however, the new incumbent, the Rev. W. G. Fitzgerald, found it necessary to do something towards improving the services, and an attempt was made to restore the church, a committee was formed, and subscriptions were obtained for thoroughly restoring and enlarging the church. Whilst the committee were deliberating upon the propriety of either pulling down the old church and building a new one entirely, or restoring the old one by rebuilding the steeple and otherwise enlarging the fabric, their proceedings were watched very narrowly by the general public, who felt that such an ancient landmark as St. Paul's steeple ought not to be pulled down and lost sight of for ever if it was possible to conserve it. A memorial, therefore, was drawn up, praying the committee to seek further advice before committing themselves to any scheme. This memorial was most numerously signed by the inhabitants of both town and county, and acting upon the suggestions contained therein, the committee at a subsequent meeting passed a resolution that Mr. G. E. Street should be requested to report and advise upon the matter. In his report, dated June, 1865, he states:—"The questions which arise in connexion with the restoration and enlargement of St. Paul's, Bedford, are in many respects so delicate and embarrassing that I confess to having considerable difficulty and some reluctance in reporting upon it." After advising a strictly conservative feeling in whatever was undertaken, he proceeds to say "that he never saw so long a church which was in its old state so practically useless for a large congregation; the particular division of the nave proper, being divided in the centre, produces the effect of two small churches," and he goes on to say that the only possible remedy would be some such modification of the structure as would allow of full use of the whole of the area enclosed within the external walls; this he recommends should be accomplished by the removal of the old steeple from its central position and placing it northwards; this course, although, as he states, is "attended by very weighty objections on architectural and antiquarian grounds," and the condition of the lower part of the steeple he reports as being so bad that it must ere long be either very extensively repaired or removed; he recommends, therefore, that the opportunity should then be taken to rebuild it in a more convenient position, but only on one condition, viz., "that all the wrought stones be marked, and the whole rebuilt stone for stone with no alteration of design"; the report was accompanied by a rough plan. Mr. Street felt very strongly that his advice should be taken, and if they did not concur with him he thought it would be most unfortunate if the building was touched at all; he stated that it would be best to suffer the inconvenience which our forefathers had endured for centuries, using only a portion of the old church, which he goes on to say was full of interest and architectural value, and advocated careful restoration and deprecated any departure from the old work. I have quoted largely from Mr. Street's report to show that the committee had the best advice that could be obtained, which, however, for some reason or other they did not follow, for they decided to rebuild the steeple on the old site. The result you have seen, and can best judge how far you think they have been successful.

Mr. G. Hurst at the same meeting read a paper on

St. Mary's Church.

The church of St. Mary, on the south side of the river Ouse at Bedford, is interesting on account of its high antiquity, and although portions of it have been modernised at various times, still there is sufficient remaining to show that it dates back to the Anglo-Saxon period. It formerly consisted of a nave, central tower, transepts, and a chancel. The aisles are of more recent construction; the tower is of good Norman character. It has on each side of the second stage a window of two narrow arched openings divided by a shaft, the whole enclosed within a large arch of semicircular form. On each face of the upper stage are the outlines of two small Norman lights of well-wrought ashlar, now closed, but between them Perpendicular windows of two lights have been inserted. The original plain Norman parapet has been replaced by the more modern embattlement. The north transept has long since disappeared, but the south one well merits attention, being clearly of Anglo-Saxon construction, with the exception of an arched outline similar to those in the upper stage of the tower, which was doubtless inserted when the tower was erected. With this exception, the masonry is of a much ruder character, is composed of mixed materials, and contains a considerable quantity of the green sandstone. A portion of it is of herring-bone workmanship. The presence of sandstone would indicate that it was erected with the materials of a still older building, probably Roman, as these stones must have been brought from the neighbourhood of Sandy, where the Romans had an important station, and which would not have been done had they been aware of the limestone quarries of the neighbourhood. The west end wall of the nave is original. Until the middle of the sixteenth century, opposite the west end of St. Mary's, and nearly abutting upon it, stood another church, called St. Peter's Dunstable, probably connected in some way formerly with Dunstable Priory. The site of this building was the now open space called St. Mary's-square, but it extended one-third into the present roadway, as, in laying down some gas-pipes a few years since, the eastern foundations were discovered, so the road between the two churches could scarcely be of sufficient width for more than a single cart. The services were conducted in each church on alternate weeks, and the books and ornaments removed from the one to the other. St. Peter's Church was of Early English architecture, and, accordingly, of more recent construction than the other edifice. The churchyard must have extended a considerable way westward, and have occupied a large space, now built over, as is indicated by the occasional exhumation of human bones whenever a cellar or foundation is required. After the destruction of the church, the north aisle of St. Mary's was built with part of the materials in the year 1546. The spandrels of the doorway contains, as an ornament, the carved cross-keys which distinguished the demolished church. There must have been a good deal of pinching upon the old churchyard, as is proved by the quantity of human bones discovered when any alterations have been made in the adjacent buildings. Boswell, in his picturesque views of the antiquities of England and Wales, states that the parapet of the bridge was erected in the reign of Queen Mary out of the ruins of St. Dunstan's Church which stood on the south side of the bridge. This is a corroboration of what many suppose, that the church was originally dedicated to St. Dunstan, and was subsequently re-dedicated to St. Peter on being annexed to Dunstable Priory. When the north aisle of St. Mary's was constructed, to throw it open to the church the nave wall was pierced with three arches, but being small, the parishioners had their sight obstructed, and to remedy this defect the whole of the north wall of the nave was, in the year 1840, pulled down, and the present colonnade was substituted. In the year 1853 the south aisle was added. In consequence of a rent in the south-west angle of the tower, the architect declined to pull down the whole of the nave wall, but left sufficient to serve as a buttress for its support. The western wall of the south transept from the aisle was pierced, and an arch made to correspond with that on the north aisle, thereby making a communication with the transept. A great part of the south wall of the nave had in former years been removed to insert three large Early English windows; but when the entire wall was removed to subjoin the aisle in 1853, it was found chiefly composed of herring-bone work of the native stone, and very ancient. Up to the commencement of the present century the nave had a wooden roof covered with lead. Repairs being required, the work, under church-warden management of the period, and there being no resident incumbent, was protracted for a very long time; and the roof left partly open. The lead was appropriated by some of the managers, and the present drawing-room ceiling was constructed. According to what has been related of this transaction it was hardly creditable to some of the leading parishioners. On the south side of the altar are deposited two stone coffins of the thirteenth century, the lids even with the floor; they were found buried in some other part of the church when alterations were in progress, and were removed to this position. On the north side is another coffin of about the same date, discovered under the floor of St. Leonard's Hospital when that venerable building was taken down to make way for an extension of the North-Western railway station. This establishment was founded previously to the year 1302 by the townsmen of Bedford for "six Freres Chapleynis, wearing a religious habit," and according to Dugdale was a hospital for Lazars. The coffin was sold by auction with the old materials of the hospital, and remained for some years afterwards, with its contents, disregarded in a carpenter's yard, whose effects being afterwards sold, this, by the good taste of the auctioneer, was preserved from a second desecration, and purchased by him privately and presented to the Bedfordshire Archæological Society, who obtained permission to place it in its present position. The coffin was cut from one stone, and tapers from head to foot, with a rounded excavation for the head. A floriated cross with a circular head, but considerably mutilated, ornaments the centre of the lid. The remains contained in the coffin, when first discovered, were found to be an entire skeleton, and probably of one of the early masters of the Hospital, as with them was a pewter paten . .

The President, on behalf of the members, thanked Mr. Day and Mr. Hurst for their papers.

Dr. Goldsmith asked what special period in architecture herring-bone masonry marked.

The President.—From the Roman period up to the fourteenth century.

On Wednesday, the 27th, there was an excursion, viâ Bletchley, to Leighton Buzzard, Stukeley, Wing, Eddlesborough, and Dunstable. On Thursday there was an excursion to Cople, Sandy, and Risinghoe Castle.

Among other papers read during the week were "Recent Memorials of Bunyan," by the Rev. J. Brown, B.A.; "The Grey Friars' Priory, Bedford," by the Rev. Canon Warmoll; "The Connexion of John Bunyan with Elstow," by the Rev. J. Copner; "The Brasses of Bedfordshire," by the Rev. H. Addington; "The Earthworks of Yeldon," by the Rev. R. S. Baker; and "The Treatment of Ancient Architectural Remains," by Mr. J. T. Micklethwaite, F.S.A.

BUILDERS' MACHINERY AT THE ROYAL AGRICULTURAL SOCIETY'S SHOW, DERBY.

A NUMBER of the agricultural engineering firms exhibited saw-benches, &c. Several of these were well made, but they were almost entirely of light and crude design, and certainly cannot be compared with the productions of the engineers who make this class of machinery a speciality.

Messrs. A. H. Bateman & Co. (Limited), East Greenwich, exhibited a band-saw sharpening-machine, made by Bichon & Co., Paris. It is of ingenious construction, and should, if well handled, be of service where a number of machines are employed.

A portable balanced crane, which should be of considerable use in a timber merchant's or contractor's yard, was shown by Messrs. S. E. Ransome & Co., of London. The crane is self-contained, and is so arranged that the angle of the jib can be readily extended or diminished, as required. If the load on the jib should tend to over-balance the crane, by means of a handle and screw the radius of the jib can be lessened, till the back end of the travelling-carriage is of sufficient weight to counter-balance it. Being mounted on a pair of high wheels, it can, with a load of 10 cwt., be easily moved from place to place by one man. By extending the front of the jib-carriage framing, and carving it downwards, the crane is prevented from toppling over, even should the load be too heavy.

Messrs. Allchin & Son, of Northampton, exhibited a rack saw-bench and a band-sawing machine; these were marked at low prices, but were of crude construction. The rack saw-bench was made chiefly of wood, the centre frame of oak, and the ends of red deal. The saw-spindle was of iron, and arranged to run in conical bearings. From our experience we do not recommend this form of bearings for saw spindles, as little or nothing is gained from their use, and they are much more difficult to keep in order. The travelling-table was of pitch-pine, and fitted with a hand-power rack-feed. The main frame of the band-sawing machine was of wood, with a cast-iron column bolted to it. Altogether these machines would do credit to a settler who may have rigged them up in the backwoods of America, but they are hardly what we should look for as the products of an English engineer, and are in striking contrast to the traction engine exhibited by the same firm, which shows good design and workmanship.

Messrs. Priestman Bros., of Hull, exhibited

one of their patent steam excavators and dredgers. This was filled and discharged by one man, and being arranged with rotary and traversing motion, should be of immense service in large dock or other contracts, or in lifting sand, shingle, or grain. At this stand, too, was exhibited a capital form of patent disengaging gear for hoisting or lowering goods or discharging cargoes of almost any material; this disengaging hook is so arranged that as long as the weight bears on it the load is held, but immediately it touches the ground or vessel, the hook becomes disengaged and is immediately withdrawn by a duplicate chain. A Keatle's Patent Boiler arranged with an inserted fire-box, which formed a water space, was also shown at this stand.

Messrs. Richard Garrett & Sons, of Leiston, exhibited a portable saw-bench, specially designed for forest use, but, except that it was mounted on extra large wheels to facilitate transport, it does not possess any special feature of interest. Several compound portable engines of excellent design and workmanship were also shown at this stand.

Messrs. Aveling & Porter, of Rochester, exhibited an improved form of tipping-wagon, which appeared to be well adapted for contractors' use: it was arranged to tip sideways, and the body of the wagon was readily canted by means of a hand-wheel and spindle, which worked a pair of chains. The body of the wagon was lined with sheet iron, it being found in practice that the load will more readily leave the smooth iron surface than it will one of wood.

A considerable number of more or less well-known brickmaking-machines were exhibited by Messrs. Bradley & Craven, Abell, Pinfold, Whittaker, Fawcett, and Bennett & Sayer. The machine shown by Messrs. Bennett & Sayer, of Derby, was designed for the plastic process, and embodied in its construction several improvements, including marine type multiple collar, thrust bearing at pug end, improved internal bearing, and end knife. The steam brick-press, shown by the same makers, was fitted with a top spring box and adjustable brick die-box, for taking up wear. The cutting-off table was Murray's patent.

Several engines were exhibited especially well adapted for driving sawing and wood-working machinery, where the load is often very severe, and varies constantly. In this case, to secure economy in working, especially sensitive governor gear should be employed, so that when a heavy machine, — a circular saw-bench for instance,—is thrown out of gear, the steam may be immediately controlled and prevented from entering the cylinder, and being used to waste. Messrs. E. R. & F. Turner, of Ipswich, showed engines fitted with Hartnell's Patent Automatic Expansion Governor. This form of expansion gear presents several features of interest. The principle utilised in its construction is that of centrifugal force, which, acting on a pair of weights suspended on pins, tends to throw them outwards. They are, however, governed and restrained in their action by spiral springs. The weights in flying out carry with them a quadrant or curved lever, which is arranged in such a way that it automatically acts on the slide-valve eccentric, and diminishes its stroke, thus lessening the stroke of the slide-valve, and reducing in proportion the supply of steam. Another advantage in this expansion gear is that instead of cutting off the steam by the ordinary throttle-valve, and thus diminishing its pressure before it enters the cylinder, it allows the steam to enter the cylinder at its full boiler pressure, but varies the cut-off of the stroke as the load on the engine may require, the full benefit from the expansive force of the steam being thus utilised.

Messrs. Shanks & Son, of Arbroath, exhibited a newly-designed horizontal high-pressure engine, of the girder type. It was arranged with a stroke of double the diameter of the cylinder. We may here say we are in favour of a long stroke and early cut-off for driving wood-working machinery, as ample time is given for the steam to expand, and more value is thus obtained from it. An equilibrium governor, with stop and throttle valve combined, was also fitted, and an outside bearing provided for the crank shaft. The girder framing of the engine, although strong, was, to our mind, somewhat inelegant in design.

Messrs. Ruston, Proctor, & Co., of Lincoln, exhibited a well-designed and strongly-proportioned horizontal engine, well adapted for the heavy duty of a saw-mill.

A number of stone-breaking machines were shown in operation, but most of them are too well known to need description.

A goodly array of centrifugal, rotary, direct-acting, and other pumps more or less adapted for contractors' purposes were exhibited.

Several centrifugal pumps were shown working by Messrs. Williamson, Bros., of Kendal, in conjunction with their vortex turbine water-wheel; they were of simple construction, and throw a considerable volume of water. When used for low lifts,—say not above 20 ft.—for drainage, irrigation, and such like purposes, this form of pump has much to commend it, bearing in mind its low first cost, and little liability to disarrangement.

Messrs. Evans & Co., of Wolverhampton, had a large exhibit of pumps, including a sample of their hydraulic rams, a form of pump somewhat neglected, but admirably adapted for supplying water to mansions, &c. The principle on which the ram works is that a larger volume of water having a certain fall will force, under certain conditions, a smaller volume of water to a higher point than it is itself. Very high or very low falls of water can be utilised, but both of these extremes should, if possible, be avoided, as in the case of a very high fall the friction caused by the force of the water, and consequent wear and tear on the working parts of the ram, is very great. In the case of a very low fall, the quantity of water raised is, of course, correspondingly small. The ram under notice is simply and strongly designed. The "beat," "delivery," and "snifting" valves are of gun metal, and the joints are faced.

Messrs. J. Rollins & Co., Limited, of London, exhibited several of the Douglas American hydraulic rams.

The general arrangement of the Show was excellent.

THE MARIENKAPELLE, WURZBURG.

The church called the Marienkapelle, or St. Mary's Chapel, at Wurzburg, probably because it stands upon the site of a smaller structure bearing that dedication, is a fine example of a German hall church, and offers several points worthy of study, if not of imitation.

Kugler gives 1377 as the date of the commencement of this building, which makes it the exact contemporary of the Karlshofer Church at Prague and the choir of St. Sebald, Nuremberg. Like most ancient churches, however, it appears to have been many years in course of construction. The sculpture of the doorways and the statues of the apostles round the columns were not executed until quite the end of the fifteenth century. Although both Kugler and the excellent Hand-book for the Maine, by Hänle & Spruner (Wurzburg, 1843), give the date 1377 as that of the commencement of the building, neither gives the date of its completion. As, however, it is shown in the ancient views of Wurzburg, that, for instance, in the Nuremberg Chronicle, 1482, it was certainly finished before the close of the fifteenth century, except perhaps the sculpture, which is known to have been executed by the celebrated Wurzburg sculptor, Tilman Riemenschneider.

The plan of the church is remarkably simple. It consists alone of a nave and aisles of the same height, under a single external roof. The nave is prolonged beyond the aisles, and forms a chancel. A tower and spire are attached to the north-west angle, and there is an original sacristy north of the choir. Internally the building is a vaulted hall, divided into a nave and aisles by tall and very slender octagonal piers, without capitals. Attached to the cardinal faces of the octagonal piers are corbels carrying very finely executed statues. The organ-loft is original, and is vaulted beneath. There is no ancient furniture. What at present exists is modern Gothic.

What particularly strikes one about this church is its simplicity of plan and arrangement, and the absence of anything that could cut up the design. The consequence is that although it is surrounded by houses four stories high, it looks large and impressive; in fact, it looks larger than it really is, for the whole church is only about 140 ft. long.

These "hall churches" seem to offer an excellent suggestion for ecclesiastical buildings in London and the great manufacturing towns. The pretty little Northamptonshire churches, which are over and over again reproduced in our large towns, look absurd when surrounded by immense factories or Belgravian mansions, and if Gothic architecture is to retain its hold upon the age, some much bolder and larger treatment must be found than that usually displayed in our urban churches; and it seems to us that the hall churches of Germany and the great brick single-span churches of the South of France offer suggestions as to the kind of treatment architects might do well to study.

The little shops round the Marienkapelle at Wurzburg are not, as people often suppose, a modern introduction; on the contrary, they are represented in a painting of the church executed at the very beginning of the sixteenth century. A great deal has been written about houses and shops built up against churches, and, of course, there are practical objections to the system,—danger from fire, for example,—yet there can be no doubt that many Mediæval churches were erected with the absolute understanding that they would be built up against.

The upper portion of the spire of the Marienkapelle at Wurzburg is quite modern, and not very satisfactory, though it is more or less a copy of an ancient original, *i.e.*, St. Mary's at Esslingen.

NEW OFFICES FOR THE LONDON AND LANCASHIRE LIFE ASSURANCE COMPANY.

The building, of which we gave a short notice on the 11th of June last,* and which we this week illustrate, is now finished. The style of the architecture is French Renaissance of an early type. The internal finishings have been carefully designed in character with the architecture, the ground-floor screens, desks, and counters being in two kinds of mahogany, with rosewood mouldings; the staircase leading from the ground-floor to the board-room on the first floor is also in mahogany. The entrance-doors are of teak, the central panels being carved with medallions symbolical of Life and Fire. The ceiling is in fibrous plaster, with rib mouldings interlacing, and fan-ribbed vaults springing from the central columns. This portion of the work was executed by Messrs. G. Jackson & Sons, of Rathbone-place. The public space is paved with mosaic. The screens on the first floor are in black walnut, those on the second floor being in grey walnut, and the upper floors pitch pine.

The offices on the upper floors are approached from Sun-court by an easy staircase of Craigleith stone. The lavatories and water-closets are lined with tiles in colours, the floors also being of the same material.

The peculiarity of the site as intersected by the gateway necessitated, to some extent, a departure from the usual practice in designing the upper portion of the front by making single columns only possible at the ends.

Mr. T. Chatfeild Clarke, of Bishopsgate-street Within, is the architect; and Messrs. Colls & Sons are the builders.

The desks and screens on the ground-floor have been executed by Mr. W. H. Lascelles; the marble mosaic is by Messrs. Burke & Co.; and the carving by Mr. F. G. Anstey, who also made the specially-designed chimney-pieces with which the fireplaces are fitted throughout.

Art at the Crystal Palace.—The several scholarships and art prizes pertaining to the Ladies' Division of the Crystal Palace School of Art, Science, and Literature, have been awarded:—The Committee of Artists, Mr. H. Stacy Marks, R.A.; Mr. Alfred D. Fripp, of the R.S.P.W.C.; and Mr. W. F. Woodington, A.R.A., adjudged the silver medal for Mr. E. Goodall's pupils to Miss Mary E. Grose, of Forest-hill, for two picturesque studies in the Italian and Renaissance vestibules; and the certificate to Miss Catherine Maltilda Banks, of London, for a picture of the "Pompeian Court." Miss Beatrice A. Brown, of Honor Oak Park, who had the scholarship last year, took the certificate among Mr. F. Smallfield's students for painting from the life; and the same student obtained the certificate among Mr. O. Von Glehn's pupils for drawing from the life. The medal for drawing from the antique and from the life was gained by Miss Edith Mary Chambers, of Sydenham. For sculpture, Mrs. Cottingham, of Norwood, got the certificate; and to this lady, among the winners of the certificates, the scholarship in art for 1881-82 was adjudged.

STATUETTE OF MINERVA, RECENTLY FOUND IN ATHENS.

Ground Floor Plan

First Floor Plan

Whiteman & Bass *Photo-Litho*

Wyman & Sons, Printers

ST. KATHARINE'S TRAINING COLLEGE, TOTTENHAM.

STATUETTE OF MINERVA RECENTLY FOUND IN ATHENS.

We give a view of this statuette, found a few months ago in Athens. We have already published a description of it, and commented on the misconceptions about it which at first prevailed, but may here recapitulate the chief points.

The statuette is of Pentelican marble, and, inclusive of the socle (which is 6 centimètres high), it stands 96 centimètres, or 37·79 in. high. All the archæologists of Athens agree in the opinion that, as to form, it is a diminutive copy (made probably in the first century of the Christian era) of the chryselephantine, or gold and ivory, statue of Athene, produced by Phidias for the Parthenon. On the front of the helmet there is a sphinx in repose, flanked on either side by a griffin; on the right and left of each of the griffins is an eagle's wing. The sphinx has a crest, and the griffins have smaller crests. (These details are not all shown in our view.) When the statuette was discovered, the head of the sphinx was found to have been broken off, as also had the griffins and the eagles' wings, but, with the exceptions of the griffins' heads, all the fragments were recovered. The profile is good, though the parts about the mouth are somewhat coarsely executed. On the helmet of the statuette some red lines are reported to be visible, and it is further stated that the hair, passing down from under the helmet, over the brow and on to the breast, shows traces of yellow colour, and that the eyebrows are reddish-brown and the pupils of the eyes blue,—the right eye still preserving the colour very clearly. The *chiton*, or under-robe, reaches down to the feet, while the *himation*, or outer cloak, is gathered up by a girdle that ends in two snakes' heads. Worn over the shoulders, and extending half-way down the back and bosom, is some scale armour. The back part of this shows no ornamentation, but in the centre of the front portion is a head of Medusa, showing traces of red colour. The left arm of the statuette, which appears to be somewhat disproportionately long, holds a shield which rests upon the ground. In the middle of the external face of the shield is a Medusa's head, with traces of red colour. Between the shield and the figure is a serpent, which rears its head nearly as high as the top of the shield. The serpent's head is yellow, other portions of the reptile being coloured red. The right arm of the figure, which was broken off at the elbow when found, rests on a nondescript kind of column, which was likewise broken when discovered. In the right hand is held a small winged figure of Nike (Victory) looking away from the statue. The figure of Nike has the drapery thrown over the left arm. This figure was broken into a number of pieces, all of which, however, have been recovered, except the head, for which the municipality of Athens have offered a reward of 500 francs.

Professor C. T. Newton, of the British Museum, in one of his lectures on "Greek Art in the Age of Pericles,"—the whole of which were reported by us in the early months of the present year,—referred at some length to this statuette as throwing light on Phidias's chryselephantine statue of Athene in the Parthenon, of which, he thought there could be no doubt, it was a rough copy,—a dull, cold, lifeless, Roman copy,—made for votive purposes. That the statuette was meant to be a representation of the famous work of Phidias, Mr. Newton observed, there was evidence in the writings of Pausanias, who mentioned that the left hand (*i.e.*, the same hand that supported the shield) of the chryselephantine statue held a spear. The probability was, he thought, that in the chryselephantine statue the goddess was represented as holding the spear between the thumb and forefinger of the left hand, while the remaining three fingers of the hand grasped the top edge of the shield. The disposition of the fingers of the left hand of the statuette is, as will be seen, different to that suggested by Mr. Newton as having existed in Phidias's great work. With regard to the column,—architecturally of a very debased type,—which has been introduced into the statuette as a support for the right arm of the goddess,—the arm which holds up the Victory,—Mr. Newton observed that there was no evidence given by ancient writers of the existence of any such column in connexion with the great chryselephantine statue, and, although in one or two ancient reliefs representing the statue a column was introduced to support the arm, there was, he thought, no valid ground for assuming that Phidias's great work included such a column. In his opinion, the column in the statuette was introduced with the simple view of strengthening the arm of the figure, which, being of marble, would be extremely liable to be broken off without some such support. The statuette, said Mr. Newton, was doubtless only intended to recall to the worshippers of the goddess the main features of her famous chryselephantine statue. How the arm of the latter was made, unaided by a column or some such support, to sustain the weight of the statue of Victory which she held in her hand, he was unable to say. The weight of the Victory held by the chryselephantine statue must have been considerable, and from the way in which the arm was held out, the leverage exerted must have been very great. Probably a bar of copper extended throughout the whole length of the arm of the statue.

ST. KATHARINE'S TRAINING COLLEGE FOR SCHOOL MISTRESSES, TOTTENHAM.

This institution has been established by the Society for the Promotion of Christian Knowledge, and is intended for the training of schoolmistresses for Church schools. Accommodation is provided for 100 students, a lady superintendent, governesses, and the necessary servants of the establishments.

Lecture-rooms and class-rooms are provided, and a sitting-room for the principal, who will ultimately have a residence close to the college.

Large schools for girls and infants, and a higher-grade school for girls, have been erected on the east side, connected with the main building by a covered way.

The whole of the buildings are of stock-brick, relieved with bands and string-courses of red. Lascelles's patent concrete is used in the chimney-shafts and in other positions instead of stone. The roofs are covered with Broseley tiles.

The contractors were Messrs. Dove Bros., and Mr. W. Overton was clerk of the works. Mr. A. Blomfield, M.A., was the architect.

At the last distribution of prizes, the Rev. E. Hobson (principal) dwelt on the fact that the buildings were found to admirably answer the purposes for which they were designed, and that in every department of the institution, and in almost every detail of every department, they found the requirements of the residents completely satisfied.

SANITARY PLUMBING.

SOIL-PIPE AND WASTE-PIPE CONNEXIONS, DRAIN VENTILATION, AND FLUSHING.

Mr. S. Stevens Hellyer delivered his sixth and concluding lecture* on "The Science and Art of Sanitary Plumbing," on Thursday, the 28th ult., in the Hall of the Society of Arts, Professor Henry Robinson, of King's College, in the chair. The subjects treated of were the connexions of branch pipes with main pipes and traps; waste or overflow pipes from safes; cistern wastes; disconnexion of drains from sewers and cesspools; drain ventilation; and the value of good water flushing. The lecturer commenced by observing that what he had to say might appear too full of detail, but if ever we were to arrive at perfection in sanitary plumbing, we must pay great attention to all its details. A general and roughly-carried out sanitary arrangement might do very well for temporary encampments, but places which were to be used as our homes, and the homes of our children, must have every hole and corner lighted and ventilated; every water-closet, sink, bath, and lavatory, constructed on sanitary principles; every trap self-cleansing; every waste-pipe, soil-pipe, and drain wholesome; in short, if there was to be no harbouring of filth in any part of the drainage system, it must be perfect in all its details.

Connexions of Branches with Main Pipes.—All branches, whether for conveying dirty water, soil, or sewage, should be connected to their main pipes in such a way that the discharges through them shall pass into the main pipe in the direction of its outfall, and in such a manner as not to foul any part of the pipe, be it a waste-pipe, soil-pipe, or drain, where it would not be cleansed by the flush of water following such discharges. In fixing a range of water-closets on a floor, the branches from them were often made to enter the chief branch on its upper side, and in such a manner that the discharges through any of the minor branches nearest the main stack would foul the chief branch, where it could not get cleansed again until a water-closet more remote from the main stack were used, which might not be for some hours afterwards, and perhaps not for some days. The excrement thus carried back and deposited would thus have time to dry and corrode before a flush of water was sent into the pipe from the adjoining closet to send such filth away. Therefore, all minor branches into a main branch having only a slight fall, should be made to enter at the side obliquely, and never at right angles to or on the top of the main branch. The junction should be kept well up from the bottom or bed of the main branch pipe, to prevent any matter flowing into the minor branches when travelling through the pipe. It was also an evil to continue on the chief branch pipe for ventilation above the highest of the minor branches, for the discharges from the latter would splash and flow up towards the open end of the chief branch pipe, especially if more than one water-closet was discharged at one time, and as there would be no water-traffic through that part of the main branch, it would not only become foul, but would be liable to stoppage,—at any rate, sufficiently so to prevent proper ventilation. No ventilating-pipe should be taken from a waste-pipe, soil-pipe, or drain, at a point which could be closed up by a stoppage or back-flow in the pipe,—*i.e.*, the ventilating-pipe should always be connected to the waste-pipe, soil-pipe, or drain in such a way as to make it difficult for discharges sent through such pipings to reach the mouth of the ventilating-pipe to choke it, and the connexion should be so made that if anything splashed up into the ventilating-pipe it should readily fall back, or drain itself out again. How often did one see a range of lavatory basins fitted up with the branch wastes from them entering the top of the main branch at right angles! When a basin near the main waste in such an arrangement was emptied through a minor branch into the main branch, the contents of the basin would flow both ways, and the suds would hang about the pipe and corrode upon it unless the basin farthest from the main waste were immediately used. Another evil attending such an arrangement was that there would be a constant circulation of the vitiated air in the main branch from basin to basin, and such bad air, arising from stale soap-suds and other matter adhering to the sides of the pipe, would be breathed by the persons bending over the basins to wash their hands; for in the "tip-up" basins the impure air would easily come up between the basin and the "receiver," and in plug-basins (though the plug might be in its place) the air would easily escape through the overflow arm. Another error often made in the arrangement of lavatory wastes, where a range of basins discharged into one trap, was in taking the main branch into the heel of the trap in such a way that about two-thirds of the length of the main branch always was full of water. When that was the case, how was it possible to change the "standing water" of the trap and the waste-pipe with a flush of water sent through either of the basins? The body of water standing in the trap and piping might become very offensive from the use of scented soap and the washings-down of the lavatory top, and it would prevent the waste-pipe from being cleansed, for no flush of water could be sent through the pipe with any cleansing force. When a waste-pipe from one "fitting" was branched into the trap fixed under another fitting, the connexion should be so made that no air could travel from one fitting to the other, as it easily could under arrangements sometimes adopted. If one trap must be made to receive the waste-pipes from more than one basin, sink, bath, or urinal, when fixed adjoining each other, the ends of such pipes should be taken into the trap under the normal level of the standing water. But, even that arrangement, though it might do for certain places, was imperfect in principle and faulty in detail, and therefore should never be carried out in fixing sanitary fittings near a living-room or bedroom. In dressing-rooms it was common to find the lavatory-waste connected with the bath-waste, but it was impossible to keep such arrangements absolutely sweet. When two or more waste-pipes discharge into one trap, with

* For reports of the previous lectures see the *Builder*, vol. xl., pp. 651, 711, 775; and current vol., pp. 27, 87.

their ends under the water-line, the filth carried down one pipe floated up into one or more of the other pipes, and collected and lodged there. Though the matter sent up in that way might only be small in one usage, it became large from repeated usage. The lavatory would most likely be in constant use, but the bath might not be used more than two or three times a week, and when used the discharges from it would not wash out the dried filth, for that would have collected upon the sides of the dip, and of the bath-waste, above the discharging orifice. Besides, in such arrangements, a large trap was often used, with small branch-wastes into it from the adjoining fittings, so that the trap could not get properly cleaned out by a flush of water sent into it through such pipes. In such cases, filth collected very quickly in the dip or inlet part of the trap. When, on the other hand, each fitting had its own trap, the water flushes through it could be made to cleanse every part of it, provided that the water-way from the fitting into the trap was of the same bore, and that the trap was of a self-cleansing form,—*i.e.*, a round-pipe trap.

Waste-pipes and Overflow-pipes from Water-closet and Bath Safes.—It was still the practice with many country plumbers, where they fixed safes under water-closets, to connect the waste-pipe of the safe with the water-closet trap, and to fix the pipe of too small a size to be of any value in any great overflow of the water-closet. But, supposing the pipe to be large enough to take away any overflow from the closet or leaky supply valve, its connexion with the trap of the water-closet, where the stoppage which had caused the overflow had occurred, would prevent the water getting away, and the safe would be of no good in preventing the water from overflowing and doing damage. But the chief evil in such an arrangement was that excremental matter would flow up into the safe and waste-pipe from time to time, fouling the pipe where it would have no chance of being cleaned out again, and every usage of the closet would cause a disturbance of the water standing in the pipe, and make it smell. The evil was much aggravated when the pipe was connected to the cheek or heel of the water-closet trap with its orifice partly above the level of the standing water, for soil-pipe air would then readily escape through the waste-pipe of the safe into the house. The system of fixing a separate trap under the safe, and taking the waste-pipe from it into the soil-pipe, was radically wrong, though it might, with a "weeping" pipe to charge it, be an improvement on the method last mentioned. But, in a tier of water-closets, such traps often got syphoned, and then they became inlets for bad air to the house, and might continue for hours, and even days, unsealed, and all the time the air from the soil-pipe would be escaping into the house, for the water-closet with which they were connected might not be used for days together to recharge them. The only safe way of fixing safe-wastes was to connect a 2 in. or 1½ in. lead waste-pipe to the safe, and carry it through the external wall, leaving its end open for ventilation, except where birds were likely to build in it or where the frosty air could blow through it to freeze the service-pipe to the water-closet or the water-closet itself. There was very little fear of that when the ends of such pipes faced the south, and when the service-pipes were protected; but where the ends of overflow-pipes were open to the north or north-east, the air whistled up the pipe and froze the basin water,—perhaps breaking the basin and bursting the pipe. It was, therefore, better to solder a brass or copper-hinged flap on the ends of such pipes to shut out the frost and to prevent birds building in them. When, however, such pipes could be left open, they helped to change the air in the room, with a few perforations in the water-closet seat. Of course, where that was done the space between the top of the basin and the seat must be packed with india-rubber to prevent any draught coming to the occupant; and when there was any frost in the air, a piece of board could be placed over the mouth of the overflow-pipe, but that needed personal attention. The mouth of the overflow-pipe should be enlarged and soldered to the safe, and the "outlet" end should be kept at least a foot below the level of the safe, so that the weight of the overflowing water might well open the hinged flap where the latter was used. Overflow-pipes to safes under baths or slate or galvanised iron cisterns should be treated in the same way as overflow-pipes to water-closet safes,—*i.e.*, a pipe of sufficient size to take off the supply of water to such fittings should be fixed to the safe, and carried through the external wall to discharge, with an open end outside; and, to prevent such wipes becoming inlets to the house for bad air, the ends should be kept well away from all ventilating-pipes to waste-pipes and drains, and from places where any bad air could reach them. Where stop-cocks were used for supplying a bath with water, or where any supply-valve by leaking dropped its water into a safe, provision should be made in the connexion of the bath-waste with the safe for taking off such leakage, for if it were allowed to run down the overflow-pipe in frosty weather, the word "safe" would be a misnomer, for the dropping water would freeze up the outlet of the overflow-pipe, and then, if an overflow took place, it would soon flow over the safe on to the ceiling.

Cistern Wastes.—Waste-pipes from cisterns should never be connected with any other kind of pipe. As described for overflow-pipes from cistern safes, waste or overflow-pipes from cisterns should discharge into the open air, well away from all places where any impure air could reach them, for when they discharged over a gully or any other drain trap, they acted as air-pipes from such traps. Any drain air passing through the trap (caused by the water in the trap having evaporated or by the disturbing action of discharges into the trap) would pass through the waste or overflow pipe to the water in the cistern, and contaminate it. It was also a great evil to discharge a waste or overflow pipe from a cistern into a rainwater-pipe with which might be connected a sink or lavatory waste, for such rainwater-pipe was sure in time to become foul, and the bad air arising from it would readily escape through the cistern-waste to the water in the cistern. It was all very well to blame water companies for not supplying pure water, but when no great trouble was taken for keeping the water pure,—should it ever come into the cisterns pure,—we could not very well be angry with the water companies. The other day he was called in to examine the sanitary arrangements of a house which had recently been overhauled and reconstructed. He found about four-fifths of the work well done, but among one or two things imperfectly done was a cistern-waste. The pipe had been disconnected from the water-closet-trap and continued and made to discharge over a rainwater head. The cistern itself was on the attic-floor, and placed in a corner of the servant's bed-room. He was not then considering the position of cisterns, so he would say nothing about that, except that the water stored in such a quarter must get contaminated. The waste-pipe acted also as an overflow-pipe, and being thus open at both ends, there was nothing to prevent the foul air from the four or five lengths of rainwater pipe over which the waste-pipe discharged, passing to the water in the cistern. The combined sink-waste and rainwater-pipe emptied itself into a large gully-trap in the back area of the house, and as such traps, as was shown in a previous lecture, were non-cleansing, every time the water was disturbed a bad smell was emitted, which partly escaped through the window just over the trap into the house, and partly found its way up the four or five lengths of foul waste-piping, and thence through the cistern-waste, to contaminate the water in the cistern and the air in the servant's bedroom. A branch waste from a sink on the third floor was taken into the combined sink-waste and rainwater-pipe, but the branch was trapped, showing that the plumber or director of the work had an idea of such piping becoming foul; but the mystery was why he carried such a pipe as a cistern-waste into it. Cistern-wastes, he repeated, should discharge themselves well away from all traps and ventilating-pipes. When they could not be made to discharge into a roof-gutter, or on to a flat or yard, and when the only place that could be found was a rainwater-head, the standing pipe in the cistern should be treated as a plug, by soldering over its top, and an overflow-pipe to the cistern should be fixed to the cistern as described for the cistern-safe, care being taken that such pipe was of sufficient size to take off the full supply of water to the cistern. If the workman erred in this matter he should err on the side of largeness.

Disconnexion of Drains from Sewers and Cesspools, and Drain Ventilation.—No drain was properly connected with the sewer (or cesspool, as the case might be) which would allow the sewer or cesspool air to get into the drain unless it was very largely mixed with the atmosphere. Every drain should be trapped off from the sewer by an efficient and self-cleansing trap, and, immediately on the house-side of such trap an air induct pipe should be fixed to the drain; or, better still, if circumstances would admit of it, a large air-shaft should be built from the bed of the drain to the surface-lead of the ground, for the upper part of the drain at such point to be well open to the air. Where the drainage of the house had been carried out on the principles laid down in these lectures, there was no risk in opening a well-ventilated drain to the air, provided the trap used for such purposes was a self-cleansing one, having a good water-seal (to allow for evaporation), and provided, also, that it was only of such a size as to admit of the whole of its standing water being changed by a flush of water sent through the drain. But to fix such an arrangement—say, for instance, in the area of a London house,—and to connect it to an old brick drain, saturated with sewage matter, and of such a size that no amount of water that could be sent into it would flush it; or to fix it even to a pipe-drain too large to be flushed out, and, therefore, too large to be kept wholesome, was to run a great risk of getting intolerable stinks at such openings. It required good experience in such matters to treat open drains successfully; but to fix a 9 in. trap where a 6 in. would be ample, or to fix a 6 in. where a 4 in. would suffice, was to run a risk of getting bad smells into the house if the latter was near such openings, for the contents of the trap would under such circumstances only rarely be entirely changed. Where the outlet end of the drain into such traps could not be left open to the atmosphere, —for various reasons, as, for instance, being an old drain which could not be properly flushed out, or because the opening would come directly under or near a window, or close to an opening into the house, or under a covered way where any bad air emitted from the trap or drain would get pent up, to enter the house directly a window or door near the place was opened,—then, in such cases, the opening over the top of the air-shaft or trap should be sealed up, and an air-induct pipe taken into it for the admission of fresh air into the drain from a point well removed from the house. Where the end of such induct-pipe could not be kept well away from the windows, doors, or passenger traffic, a mica-valve should be fixed over its mouth to prevent, as much as possible, any drain-air escaping through it; or, the induct-pipe could go up to the roof, but in the latter case the pipe should be kept lower than the up-cast pipe of the drain, so as to obtain better results from it. Though the plumber might have nothing to do with fixing such a trap for disconnecting the drain from the sewer, he had generally to do with the ventilating pipes of the drain, for in most cases he was called upon to fix them, especially when they were of lead; and as no drain was properly ventilated unless the air in it was changed, and as that could not be done without an inlet as well as an outlet, the plumber's knowledge of drainage matters ought to extend as far as the sewer. Not that he should be required to plan the drainage of a house, but his knowledge of sanitary matters should be such as to lead him to carry out every part of his work in an intelligent manner. If sewer air were allowed to pass freely into the drain, the whole atmosphere surrounding the upper portion of the house,—where the plumber terminated the ventilating-pipes of the drain,—would become contaminated, and such vitiated air would often get sucked into the house. If such smells were sufficiently pronounced to call special attention to them, they might get set down to imperfect plumbing; at any rate, there would not be great wisdom in making the plumbing sanitarily perfect, and leaving the drains imperfect, for if a man was to be made ill by breathing polluted air, it might as well come from defective plumbing as from defective drainage. He supposed that at the present time the larger proportion of the house drains of the United Kingdom were unventilated, and the other portion only imperfectly ventilated. In the scheme of house drainage of which he exhibited a model, he had disconnected each stack of soil and waste pipe, thereby localising each of them; and that each pipe, as well as the drain, might be perfectly ventilated, he had given each its own inlet and outlet; in fact, he had treated them in the model as they ought to be treated in practice so as to secure

a perfect ventilation throughout the whole system. In fixing ventilating-pipes for upcasts to drains, care should be taken to keep them well above and well out of the way of all openings into the house, as explained under the head of soil-pipe ventilation in the previous lecture, so that the bad air coming out of such pipes might not get into a house through a chimney, skylight, dormer-window, or any other opening. It would really be amusing, were it not for the serious consequences likely to arise, to take note of the ill-considered positions in which such pipes were terminated. Sometimes they were seen placed where no wind could reach them at all; at other times they were left so that the smallest wind might blow the air emitted from them right into a window; and in other places, by crossing and re-crossing the roof, they were carried up some tall chimney-stack and terminated at a point so situated that the slightest downward pressure of the atmosphere pressed the bad air from such pipes down the chimneys into sleeping or other apartments! No ventilating-pipe from a drain should be fixed inside a house if it was at all practicable to fix it outside. To prevent the possibility of drain-air escaping into a house from a ventilating-pipe through a leaky joint, broken pipe, nail-hole, or any other defect, such pipes should be fixed outside the house. When such pipes were of lead, and were wanted to stand for a century or centuries, as leaden rain-water pipes would, they should be kept out of the power of the sun as much as possible, for with soldered joints the pipe would have no freedom for expansion or contraction, as in leaden rain-water pipes with slip socket joints.

Value of Good Water-Flushing. — If water carriage was to be the system of removal, water must be used freely. If the slops and sullage of a house were to be effectually removed, whatever else might be limited in a house, water must not be. To make water the cleansing power of waste-pipes, soil-pipes, and drains, and then to limit its use, would be to leave the filth lodging, decomposing, and corroding in the pipes. How we should ridicule a vestry board which sent a street scavenger to clean Regent-street, say, with one sweep of his broom, to begin at one end and push it right through the centre of the street to the other end. And yet such a swept track as that represented the treatment a soil-pipe often got. The pipe was befouled all over by an offensive excremental discharge sent into it, but the water used for washing out the pipe was only sufficient, in many cases, to cleanse a channel down its sides. A pailful of slops, collected from chamber utensils, was thrown down a water-closet in a body sufficiently large to foul the whole of the soil-pipe belonging to the closet, and, at the same time, a water-waste preventing valve was opened for two gallons of water to pass into the closet to cleanse it; but the water, squirting into the water-closet as if it came from a boy's syringe, was of little value for cleansing the pipe, as it did not cover the whole of the parts fouled, and the parts unwashed became coated over with excremental matter, corroding up the pipe and making it unwholesome. The real cause of pipes stopping up was the want of good water flushing. It would be possible to stop up a 6-in. pipe to a water-closet or urinal with a bad supply of water to it, quicker than a 3½-in. one with a good supply of water. No waste-pipe, soil-pipe, or drain could be kept wholesome unless adequate flushes of water were sent through it immediately after discharging dirty water or excremental matter into it; and before such discharges were sent through the traps they ought to be largely diluted with water, — especially in such cases as the contents from chamber-utensils. Measure water into slop-sinks and water-closets by the table-spoonful, and whatever else might be clean and wholesome about the house, such fittings with their belongings would not be. He knew that it was possible to utilise two gallons of water, — the quantity allowed for water-closets by the London water companies in accordance with the Metropolis Water Act of 1871,—in such a way that it should pass into a closet with greater cleansing power than twice that quantity badly supplied, but that was not the point now in question. He contended that two gallons of water were insufficient for keeping a water-closet and its belongings wholesome, and he was speaking to a body of practical men whose opinion on the matter he should be glad to hear. Were there ten men in the room who considered a two-gallon water-flush sufficient to cleanse a water-closet, basin, trap, soil-pipe, and drain after usage? ("No.") They must knock at the door of Parliament, and send in a message stating that a large body of practical plumbers found from experience that two gallons of water were insufficient to keep a "house of commons" wholesome, and that, if more water could not be allowed, such places must be abolished. Even when plenty of water could be had, however, the flush was often interfered with by bad appliances. The supply-valves, instead of being equal to flushing-out a 4 in. or 4½ in. soil-pipe, were often only of sufficient size to cleanse a 1½ in. or 1¼ in. pipe; or perhaps the boiler-screw or cistern connexion was of smaller diameter than the service-pipe, and the water was, so to speak, "wire-drawn" through it. Having called attention to Mr. Rogers Field's flushing-tank as a valuable means of flushing-out the drains of a house automatically, the lecturer went on to say that the question of flushing was a very important one, for though ventilating-pipes from drains and soil-pipes might be carried up above the roof, the stink coming from them, where the drainage pipes were not thoroughly flushed, would be so great that the whole of the atmosphere surrounding our dwellings would at times become largely charged with the bad air emitted from such pipes, and though such bad air would no doubt get largely diluted before it was breathed, in great cities,—at any rate, in a huge city like London,—it would pass at times pretty freely into houses. When the drainage of London houses was properly ventilated,—*i.e.*, when every waste-pipe, soil-pipe, and drain had its ventilating-pipe, the number of such pipes would be enormous,—hundreds of thousands. How important, therefore, was it that the stink coming out of such pipes should be minimised by efficient flushing. Having dwelt on some other points, including the supply of water to urinals, the arrest of grease before it passed into the drains, precautions to be taken against pipe-freezing, the storage of water (recommending, by preference, slate cisterns for water intended for dietetic and potable purposes), and the construction and finishing of water-closet rooms, the lecturer made the following observations as to a

Suggested Code of Rules for House Sanitation. —Various opinions were now before the public as to the best method of draining a house. Several had been referred to during the lectures, and he would simply say, in concluding his remarks on "the science and art of sanitary plumbing," that it was about time that the opinions of sanitarians on such matters should be consolidated. The principles of house drainage were so far determined upon that there ought to be no great difficulty in framing a good sanitary code as a general basis to work from. He would have the boundary lines of such a code marked out with silken cords rather than with iron bands; for, like all new things, sanitary knowledge should have room to grow. He believed it would be just as easy for a tailor to make a suit of clothes to suit all climates as it would be to lay down a code of sanitary rules to suit all cases. If he had to draw up such a code of rules he should make them read somewhat as follows, viz.:—

1. That pure water shall be supplied to every house for dietetic purposes, and where this water cannot be drawn direct from a constant supply, it shall be stored in cisterns easily accessible for cleansing purposes; and such cisterns shall be so placed that no vitiated air can reach them, either from the house, water-closets, or ventilating-pipes,—from waste-pipes, soil-pipes, or drains.

2. That no draw-off cock to any sink or "fitting," other than a water-closet, shall be supplied from a cistern fitted in a water-closet, or standing in a place where any contaminated air can reach it, or from a cistern or service-pipe which also supplies a water-closet.

3. That every drain shall be trapped off from the sewer by a self-cleansing intercepting sewer trap, fixed in every case outside the house; and where the mouths or inlets of such traps cannot be left open to the atmosphere, air-inlet pipes should be taken into the drain immediately on the house side of such traps.

4. No drain shall enter the walls of a detached or semi-detached house.

5. In a line of houses, as in terraces and streets, where it is impossible for the drain to reach the soil-pipes without coming inside the house, such drain shall be of cast-iron, heavy water-main strength, and this pipe shall be "Barffed" or coated with solution, and laid in a brick trench, or fixed on the face of the basement walls, and its joints well caulked with lead. The drain shall be so ventilated that not a foot of it shall be without a free circulation of air through it.

6. Every drain from a house shall be so ventilated that no stagnant air shall remain in any part of it; and where this cannot be done by air-shafts, ventilating-pipes shall be fixed, and the drain divided into sections, and its branch drains, when of great lengths, localised, so as to ensure ventilation in the entire system of drainage.

7. All soil-pipes, where practicable, shall be fixed outside the house, with their discharging ends exposed to the atmosphere,—either directly by emptying into open traps, or indirectly by foot ventilation; and such pipes shall be carried up to the highest points of the roof full size, for proper ventilation, having their terminals well removed from all openings into the roof or house.

8. All dirty-water wastes from sinks, baths, lavatories, &c., shall discharge themselves with open ends into intercepting traps fixed outside the house, and such pipes shall be continued up through the roof full size for ventilation.

9. All clean water wastes,—from cisterns, cistern-safes, &c., shall be kept separate from other wastes, and shall discharge with open ends into the atmosphere, well away from all drain traps or places where any bad air can reach them.

10. All wastes or overflow-pipes from safes under water-closets, baths, &c., shall be kept separate from other waste-pipes, and shall be made to discharge in the open air.

11. Every sanitary "fitting" fixed inside a house where foul matter, or contaminated water, is passed into it, or from it, shall have its waste-pipe trapped off from the house, and such trapping shall be made immediately under such "fitting."

12. All traps fixed inside the house shall be self-cleansing; and no trap which fouls itself or is not easily flushed out shall be used on the drainage outside the house.

13. All traps to water-closets, slop-sinks, sinks, baths, lavatories, &c., which can have their water syphoned out by the use of any fitting upon a pipe in connexion with them, or by the use of themselves, shall be ventilated, to prevent such syphonage, and also to allow of the branch pipes being ventilated.

14. No sanitary fitting shall be fixed which will not allow a good flush of water to be sent through it to cleanse it and its belongings, to prevent any pipe from it,—be it a waste-pipe, soil-pipe, or drain,—from getting unwholesome.

15. Every house shall be provided with proper and efficient means for flushing-out the whole of its drainage.

16. The walls inside water-closet seats, the floor, and the walls of water-closets, should be made air-tight to prevent any odours in them passing to any room adjoining through a crevice, crack, or opening.

17. The rooms of water-closets should be well ventilated, so that a constant change of air may take place in them.

In conclusion, Mr. Hellyer observed that whatever charge might be laid against journeymen plumbers, want of interest in their trade could not be alleged against them, for he questioned if the members of any other branch of the great building trades would have come out night after night, during the hot time of summer, to listen to dry lectures. Lying in their strong arms, slumbering in their hardened muscles, resting in their well-trained fingers and educated hands, was, in a large measure, the health of this leviathan city. The plumber's part in making a house, a town, a city, healthy, was enormous. He believed that if plumbing work was done on the principles laid down in his lectures, this huge city, teeming though it was with human beings, would become the healthiest, as it was now the greatest, city in the world. Let the plumbers of to-day seek to do their work in the very best way possible, so that their successors in a future age might say,—"How well the plumbers of the latter part of the nineteenth century did their work!"

The chairman addressed a few observations to the meeting. He said he considered Mr. Hellyer's lectures to be of the greatest possible value and interest, not only to the craftsmen of the plumbing trade, but to the public at large. Those who had watched the progress of sanitary reform knew that it was only by repeated efforts that reforms were initiated and the apathy of the people with regard to them aroused. He thoroughly endorsed what Mr. Hellyer had said as to the necessity of knocking at the door of Parliament, and he, for his own part, had urged the appointment of a responsible Minister of Health. Health was of at least as much importance as trade and other matters which engrossed the attention of separate Ministers. During the last few years the importance of house sanitation had been increasingly recognised, and he thought the time had come when legislation on matters of health should, on all vital points, cease to be permissive. In America, where great attention had been paid to the subject of late, a Bill had been passed, called the Plumbers' Bill, making it penal for any work of a sanitary nature in a house to be done badly. He thought a similar measure was much needed in England (loud cries of "No, no," from one or two persons in the meeting). He was sorry if he had trodden upon anybody's corns, but such was his opinion. In conclusion, the chairman announced that the National Health Society had arranged to hold a meeting for the discussion of Mr. Hellyer's lectures on Monday, August 15, when Mr. Ernest Hart is expected to preside. It is desired that all who may wish to take part in the discussion should send their names to the secretary of the society, No. 44, Berners-street, W.

A vote of thanks to Mr. Hellyer for his lectures concluded the proceedings.

The lecture was repeated on Friday, the 29th ult., Mr. H. H. Collins, F.R.I.B.A., in the chair.

BRISTOL AND GLOUCESTERSHIRE ARCHÆOLOGICAL SOCIETY.

The annual meeting of this association has been held this year at Chepstow.

The Rev. W. Bazeley read the report of the Council. There were at present 433 annual members and seventy-two life members, giving a total of 505 members. During the past year thirty-three new members had been elected, whilst the society had lost twenty-two members by death or resignation. The income of the society, including last year's balance, amounted to 240*l.* 12s. 2d. The expenditure amounted to 126*l.* 13s. 7d., leaving a balance of 113*l.* 18s. 7d. Besides this balance the society had a funded balance of 412*l.* The report referred with regret to the death of the late Professor Rolleston, who had rendered great assistance to the society, and then related the proceedings of the year. The council recommended the re-election of the various officers, with the following additions or alterations:—Mr. W. C. Lacy, vice-president (Gloucester); Mr. W. Leigh, vice-president (Stroud); Mr. H. Deane, local secretary for Stroud district; and the Rev. A. Loxley, local secretary for Fairford. The council had to report the resignation of their treasurer, Mr. Christopher Thomas, through pressure of other engagements. The council had reluctantly accepted his resignation, and had expressed to him its cordial thanks for the services he had rendered to the society, and for the interest which he continued to take in its welfare. It had also requested him to accept the office of vice-president at Bristol, now vacant. Mr. Gillet, of Gloucester, was nominated as treasurer, in the place of Mr. Thomas. The following members of the council retired, but were eligible for re-election:—Sir John Maclean, Rev. Dr. Caldicott, Rev. Prebendary Scarth, and Messrs. Adlam, Crawshay, and Lang.

On the motion of Mr. W. J. Stanton, M.P., seconded by the Rev. J. B. Green, the report was adopted.

The Rev. Fielding Palmer proposed, and Major Cowburn seconded, the re-election of the members of the Council, which was carried unanimously.

On the motion of Sir Wm. Guise, a vote of thanks was passed to the outgoing president.

Mr. J. E. Doringtон thanked the members, and introduced his successor, Sir John Maclean, who was received with applause.

Sir John Maclean then delivered his inaugural address. He referred to the interest attaching to the study of archæology, and to the fact that it was becoming more and more popular. The study of archæology might be divided into two eras, the pre-historic and the historic. The former was divided into three periods, known as —first, the stone age; second, the bronze age; and third, the iron age. He then alluded to the discoveries made in the last thirty years in the elucidation of the history, the state of art, and the degree of culture of the ancient empires, especially to the discoveries of Layard, Rawlinson, Smith, Wood, Schliemann, and others. He afterwards referred to the ancient remains of our own country. Gloucester was particularly rich in them. The long barrows almost wholly found on the Cotteswold hills showed that these high lands were somewhat thickly populated at a very early period. He also gave some interesting particulars concerning the Forest of Dean. He was not aware that it contained any pre-historic remains of a definite character. That the Romans occupied the district between the Severn and the Wye was clearly established by the roads by which the district was traversed, by the coins and other articles found in the old iron workings and elsewhere, and by the remarkable remains which still existed at Lydney Park. He dwelt upon the importance of the greatest care being exercised in the restoration of our ancient parish churches, adding that the manner in which some of them had been "restored" made one sick at heart.

After luncheon at the Beaufort Arms Hotel, the members repaired to Chepstow Castle, where Mr. G. T. Clark, of Dowlais, gave an interesting description of its history. Chepstow Church was also inspected, and afterwards there was a carriage excursion to Beachley and Sedbury-park, at the latter place Offa's Dyke being inspected and the president making some remarks upon it. After this the members partook of tea at the residence of Mr. S. S. Marling. Returning to Chepstow, they dined together at the Beaufort Arms.

The members met in the evening at the hotel, under the presidency of Sir John Maclean, who read some "Notes on a Hiding-place found at English Bicknor." He said that in the week preceding Christmas, 1880, some men, whilst levelling down a rocky bank in a steep field on the glebe at English Bicknor, discovered a cavern, which had evidently been fitted up with considerable care as a place of concealment. It was oval in form, 6 ft. high, 6 ft. in length, and 4 ft. or 5 ft. in breadth. The entrance was low and narrow, allowing just sufficient room for a man to creep in. The cave was quite concealed, and it was evidently a carefully-prepared place of retreat. A number of relics were found. It was supposed that they were of the date of Charles I., and that the cave was the hiding-place of some unfortunate Royalist in the time of the Civil War.

The Rev. W. Bazeley (one of the general secretaries) read a paper contributed by the Right Rev. E. Twells, D.D., on "The Cistercian Order."

The Rev. John James followed with a paper describing a leaden tablet lent by Mr. Charles Bathurst, of Lydney Park, for the temporary local museum of the present meeting. The speaker, reading and translating the Latin inscription on the tablet, said it was one of the most curious of the Anglo-Roman remains which had been discovered on the heights of Lydney camp. The ring to which it referred had been recovered and identified at Silchester.

The Rev. R. Hall read a paper on "Local Names in the Forest District."

Sir William Guise being appealed to to make some remarks on the paper, said there was no subject so full of pitfalls as nomenclature, and none into which philosophers tumbled head over heels so soon as nomenclature, and he declined to follow them.

On the second day, a large party assembled at the Beaufort Arms Hotel in order to proceed to various places of interest in the locality. Breaks and carriages were provided, and about eighty ladies and gentlemen joined in the excursion. The party proceeded *viâ* Tidenham Chase, —a most picturesque bit of country,—to St. Briavels. Here a stoppage was made, and under the guidance of the Rev. W. T. Allen, they inspected the church and castle. The church is a handsome structure, and immediately opposite it are the remains of the castle. The annals of Giraldus state that the Castle of St. Briavels was built in the reign of Henry I. (1100-1135) by Milo-Fitz-Walter, Earl of Hereford, to check the inroads of the Welsh,—who were particularly active in harassing their neighbours in those days,—and to confirm the authority of the Norman kings in this region. Houses have been built round close up to the edge of the old moat. A bit of the latter still remains, the pent stock and *batardeau* forming a roadside pool by the gateway. It is fed by two natural springs from the high ground above. The castle stands, or rather did stand, on a sharp shoulder, not on the summit of the hill. It is built of the Old Red Sandstone brought from the common, which is distant about a mile. The double tower of the gateway entrance is still inhabited, but the remainder of the building is in ruins, and unless something is done to preserve them the walls will very soon be level with the ground. There is a fine old kitchen on the right, inside the gate. The chimney is 9 ft. wide, and there is an iron plate there bearing the arms of Elizabeth. The walls are 9 ft. thick. The original dog-wheel, inside which the dogs ran to turn the spit, still remains. The roof of the twin tower is no longer weather-proof, and its few remaining rooms will soon cease to be habitable; the tower itself will soon rank with the things that have been unless speedily cared for. Having spent a pleasant hour here the party proceeded to Tintern, stopping for a brief period at St. Margaret's Grove in order to inspect a portion of Offa's Dyke. Tintern was reached about half-past one, and the excursionists paid a visit to the abbey. Thanks to the care bestowed upon it by the Duke of Beaufort, the remains are more carefully preserved than is the case with most of these ancient monuments. Mr. T. Blowhill gave an interesting description of the venerable pile. On the return journey to Chepstow, the party visited Piercefield Park, and were entertained to tea by Mrs. Clay.

At the evening *conversazione*, Mr. W. C. Heane contributed a paper on "The Grange in the parish of Flaxley." He said the Grange estate, and a farm adjoining it called Saint White's, were parcels of the possessions of Flaxley Abbey. They were in the parish of Flaxley, but formed an outlying part of it, being separated from the mother parish by the parish of Littledean and part of the Forest. The Grange itself was a three-storied house of Tudor, or, perhaps, Jacobean, architecture. Nowhere on its walls could a date be seen, nor had he found any mention of the building of it. It gave one the idea of not having been completed, but as if it had been intended to build the house to form three sides of a square with a quadrangle in the rear, and that the third side or wing was never built. There was a tradition that part of the house was burnt down, but he could find no evidence of this. It was fast becoming a ruin, as no care had been taken to keep the roof in repair. In 1866, when his father left it, a few hundred pounds would have put the old place in perfect repair, but that was not done.

Mr. T. Henry Middleton contributed "Notes on the Church of Mitcheldean." No part of the existing church, with the exception of the font, appeared to be earlier than the beginning of the fourteenth century. The earlier portion, which belongs to the Decorated period, consists of a somewhat narrow nave, with a south aisle, at the west end of which stands a tower and spire, and opening into the tower on the south side there is a small porch. On the north there were originally two Decorated aisles, but the northernmost of these was rebuilt during the Perpendicular period, probably to gain increased width, when Robert Gryndour founded his chantry here. The eastern part of the chancel is modern, and a vestry has been added to the north-east. A number of modern windows have been inserted of various styles, in some cases not in accordance with the date of the work around them. On the whole, the church is a fine and interesting one, in spite of the loss of its fittings and the thorough "restoration" it has undergone. The earliest feature of the former church is the font, which is Norman, and tub-shaped. The upper half has been lost, and the remaining half is turned upside down, and has the basin cut in what should be the base.

Mrs. Baguall Oakeley contributed a paper "On some Roman Coins found in the Forest of Dean," and the President read a paper on the "Outlines of the History of the Manors and Advowsons of Mitcheldean and Abbenhall."

The concluding meeting was held on the morning of the third day, at the Beaufort Arms Hotel, the President, Sir John Maclean, in the chair.

Sir Wm. Guise proposed that the next annual meeting be held at Stow-on-the-Wold, and that the selection of the President be left to the Council. He said the district he had named had lately been opened up by railway communication, and he believed that there was less known of that portion of the Cotswolds than of any other part, although it embraced one of the most interesting and beautiful parts of Gloucestershire.

Mr. J. F. Nicholls seconded the motion, and remarked that it was a corner of the county of which very little was known, so that it would be very interesting to go there.

The motion was carried *nem. con.*

Mr. Gambier Parry proposed a vote of thanks to the President. He said they all deeply felt the sudden loss of Mr. Granville Somerset, who was to have taken the chair at that meeting, for those who knew him entertained respect, affection, and even reverence for him. They were greatly indebted to Sir John Maclean for accepting the post, and for the ready and efficient support he had given to the society.

The President, in reply, said it was very gratifying to find that his labours had met with their approbation, but the success of the association was more particularly due to the President of the Council, to whom he proposed a vote of thanks.

Sir William Guise, in reply, said he took great interest in the society from the beginning, and it was with great satisfaction and pride that he saw the position they had achieved. He concluded by proposing a vote of thanks to Mr. Palmer Hallett and the Rev. W. Bazeley, the general secretaries, who replied.

At half-past ten the members started on an excursion to Lydney and the Forest of Dean. Some of them journeyed to Lydney Park by road, conveyances being provided for them, whilst the greater number proceeded by rail to Lydney Junction. Here they alighted, and were met by Mr. Lamb, who acted as guide. They first visited the parish church, a fine old building in the Early English style, with chancel, nave,

and aisles, and a square tower, with a finely-proportioned steeple. There are many interesting archæological features in the church. Passing through the village,—or, perhaps, it ought to be termed a town,—the cross in the centre of the cross roads was noted. From the top of the pyramid of steps on which the cross rests the priests in the old time used to preach. The party then proceeded to Lydney Park, the seat of Mr. Charles Bathurst, where the Rev. Prebendary Scarth described the Roman camp, villa, and temple at Lydney. The party subsequently proceeded to the Speech House, where Mr. J. Bellows, of Gloucester, read an interesting paper on "Ancient British Life in the Forest."

NATIONAL ASSOCIATION OF MASTER BUILDERS OF GREAT BRITAIN.

The National Association of Master Builders of Great Britain held their seventh half-yearly meeting at the rooms of the London Master Builders' Association, 27A, King-street, Covent Garden, London, on Tuesday, the 26th ult., when representatives were present from the local associations of the principal towns in the kingdom.

The report and audited accounts for the past half-year were read and adopted. Mr. Clay, the late president, was presented with an illuminated address expressing the thanks of the Association for his past services as president.

The occasion, being important, was embraced by the London builders as a fitting opportunity to entertain their provincial brethren. A numerous gathering dined at the Criterion in the evening. Mr. Stanley G. Bird (the president) occupied the chair, and amongst those present were Mr. R. Neil, jun., Mr. B. Hannen, Mr. Ex-Sheriff Burt, Mr. T. Clay, Mr. G. Plucknett, Mr. W. H. Cowlin, Mr. E. Hughes, Mr. J. Whitcher, Major Waller, Mr. J. Leslie, Mr. C. W. Barker, Mr. J. B. Simpson, Mr. L. J. Maton, Mr. A. Bird, Mr. J. T. McLachlan, Mr. W. C. E. Creswick, Mr. W. Knox, Mr. W. Clules, Mr. Bennett, Mr. Beanland, Mr. Malone, Mr. J. H. Colls, Mr. J. T. Chappell, Mr. W. A. Colls, Mr. H. G. Smith, Mr. A. J. Mansfield, Mr. A. R. Smith, Mr. R. Gurney Hoare, Mr. J. McLachlan, Mr. J. Bradney, Mr. T. E. Phillips, Mr. W. Bird, Mr. C. Bird, Mr. Bonnar, Mr. C. J. Bennett, Mr. A. Thorn, Mr. T. Patrick, Mr. H. Kelly, Mr. E. Kelly, Mr. S. E. Haward, Mr. J. Clemence, Mr. J. Wall, Mr. Barfield, Mr. T. Hook, Major Brutton, Mr. G. S. Pritchard, Mr. R. D. Lown, Mr. H. Dove, Mr. Callaghan, Mr. Nightingale, Mr. J. C. Hannen, Mr. W. Southern, Mr. Kirk, Mr. Randall, Mr. Doulton, Mr. Marsden, Mr. Edwards, Mr. Chambers, Mr. H. Burman, Mr. Little, Mr. Dove, Mr. Collingridge, Mr. Stedman, Mr. Duffield, Mr. Webster, Mr. Adamson, Mr. F. J. Dove, and Mr. E. S. Henshaw.

The loyal toasts were given from the chair, and duly honoured.

Mr. E. Hughes proposed "The Army, Navy, and Reserve Forces," Major Brutton (secretary of the Builders' Benevolent Institution) and Major Waller responding.

Mr. Plucknett gave the toast of the evening, "Success to the National Association of Master Builders of Great Britain, and the health of the President," which was received with cheers. He said that, considering the short period of the society's existence, the results that had been attained were extremely gratifying. Many of the leading builders of the country had already joined them, and he felt sure that motives of self-interest, if no other motives, would induce all the great building firms to enrol themselves in the list of members. He himself looked forward to the time when, through the operations of this Society, strikes and lock-outs would be things of the past. With the toast he desired to couple the name of their president, Mr. Stanley G. Bird, who had worked zealously for the objects of the Association, and without whose courage and perseverance at the commencement he doubted whether it would ever have come into existence.

Mr. Bird, who was heartily cheered, said he felt himself justified in declaring that the Association of Master Builders had already rendered to the trade services of a most important character. He doubted, however, whether it was possible yet to foretell the happy period when strikes should be an end; on the contrary, he believed that with a return of prosperous times their troubles would commence again. At that time, however, the trade generally would understand the immense advantage of being able to refer their difficulties to such an institution as this. Alluding to specific objects that had already been attained through the instrumentality of the Association, he mentioned a new form of contract, and the establishment (arising out of the Employers' Liability Act) of the Builders' Accident Insurance Company.

Mr. Hannen gave "The Local Associations of Master Builders," insisting upon the advantages rendered by these institutions.

Mr. R. Neil and Mr. W. H. Cowlin replied.

Mr. Clay responded for "The Visitors."

PROPOSED ARCHÆOLOGICAL CONGRESS AT MALVERN.

In 1848 the British Archæological Association held its fifth annual congress at Worcester, and in August, 1875, its thirty-second annual meeting at Evesham, in the same county; notwithstanding these two visits, the ground that it is now proposed to explore in the neighbourhood of Great Malvern contains many objects of archæological interest probably but little known to the members and visitors who will attend this, the thirty-eighth annual meeting of the Association.

Malvern has been described, justly enough, by Horace Walpole and others, as one of the most beautiful and picturesque localities in Great Britain. It embodies in itself and immediate neighbourhood events and episodes connected with many remarkable epochs of our history, and notably with the great civil struggles of the Wars of the Roses and the later deadly conflicts at Edge Hill and the city of Worcester, contests fraught with consequences of the deepest import for the then future glory of our country, the study of which presents features of unusual interest to the archæologist and historian. The council of the British Archæological Association gladly availed themselves of the encouragement offered by the late lamented Mr. Chance and other leading inhabitants, to hold their thirty-eighth annual congress at Malvern, through their hon. congress secretary, Mr. George R. Wright, F.S.A., who, with a view to carrying it to a successful issue, has been making all requisite arrangements, in conjunction with an influential local committee, of which the hon. secretaries are Messrs. W. Tyrrell and Edward Nevinson.

The opening day at Malvern, Monday, August 22nd (after the inaugural address of the President, the Very Rev. the Lord Alwyne Compton, D.D., Dean of Worcester, at 3 p.m.), will be chiefly dedicated to an examination of the Priory church, founded *circa* 1080. This portion of the once much larger edifice, and which has been used as the parish church of Malvern since the days of Queen Elizabeth, presents, in its mixed styles of Early Norman and Late Perpendicular work, many features of interest and beauty, and as far as its famous painted-glass windows are concerned, is considered to be unrivalled by any other ecclesiastical edifice in the world. In the evening there will be a public dinner at the Imperial Hotel, to which ladies are specially invited.

In addition to the week's work at Malvern, it is intended to visit Worcester on the following Monday and Tuesday, August 29th and 30th, and thus again pay a tribute of respect to the new beautifully restored cathedral, and to the many other objects of antiquarian interest to be found within the time-honoured walls and neighbourhood of the city of Worcester.

The Mayor and Corporation of Worcester have, with characteristic kindness, already offered every facility to the Association for the purposed visit to their city; and the Worcester Diocesan Architectural and Archæological Society have also signified their wish to co-operate with the Association, both at the Malvern meeting and at their own ancient city.

On Wednesday, August 31st, it is proposed to go to Cheltenham for the purpose of examining some of the MSS., rare books, and pictures, at Thirlestane House, which were collected by the late Sir Thomas Phillipps, bart. These, by the kindness of the Rev. J. E. Fenwick, M.A., will be placed before the members and visitors, and explained to them by Mr. E. Maunde Thompson, V.P., F.S.A., keeper of the MSS. British Museum. Afterwards visits will be made to Leckhampton Church, Prestbury, and Bishop's Cleeve.

During the Congress week at Malvern, excursions will be made by carriages and railway to Birtsmorton Court, a moated manor-house of the fourteenth century: the adjoining church; "Payne's" Place, where Margaret of Anjou took shelter; Tewkesbury battle-field; the restored Abbey Church and old houses at Tewkesbury; Severn-end Manor House, Brockeridge-common, Ripple Church Twining, Bredon Church and Tithe Barn and Bredon Hill (king and queen stones and camp), Bosbury and Ledbury Churches, Wall's Hill Camp, Much Marcle and Kempley Church, the latter having some good frescoes on its walls, discovered a few years since; Kidderminster Church, Warshill (close to Habbersley), Bewdley, Ribbesford, Areley Kings for Manor House, &c.; Redstone Hermitage and Astley Church, thence to Moor Hall, by the invitation of Mr. John Brinton, M.P., who will take charge of and conduct the party on the Kiddermiuster day; Little Malvern, Herefordshire Beacon, and Midsummer Camp, an ancient British fortress of large extent; Branshill Castle, a Norman stronghold; and Eastnor Castle and Park, by the kind permission of the Earl Somers, &c.

Meetings will be held every evening in the schoolroom of the college, by the courtesy of the authorities, at half-past eight, for the reading and discussion of Papers, after the opening day, and all members or visitors desirous of contributing papers on local or other archæological subjects are requested to communicate at once with the hon. secretaries, Mr. E. P. Loftus Brock, F.S.A., 19, Montague-place, Russell-square; or Mr. W. de Gray Birch, F.S.A., British Museum, Bloomsbury.

THE PROPOSED NEW WORKHOUSE AT CHAMPION HILL, DULWICH.

There appears a probability that the proposal of the St. Saviour's Guardians to erect a large new workhouse at Champion Hill will not be carried out, although the land has been purchased for the purpose. It is a matter of notoriety that the proposal has met with the strongest opposition on the part of the owners and occupiers of property in the locality, and now the several parishes interested are taking steps to prevent the erection of the building, which, it is stated, would cost something like 200,000*l*. The parishes comprising the Union of St. Saviour's,—Newington, St. George's, Christchurch, and St. Saviour's,—are about to be called together by delegates to take into consideration the great outlay contemplated by the erection of the proposed building.

COMPETITIONS.

New West St. Giles's Church, Edinburgh.—The competing plans for this new church were submitted to Mr. John Macvicar Anderson, hon. secretary of the Royal Institute of British Architects, for his opinion. That gentleman has now reported in favour of the design by Messrs. Hardy & Wight, 7, St. Andrew's-square. The style of the building which Mr. Anderson recommends for adoption is Gothic of the Decorated period, with tower and spire, 160 ft. high. The spire is slender in its proportions, and rises from a parapet of open quatrefoil-work, similar to the work in old St. Giles's tower, with flying buttresses at the angle pinnacles. The church shows a nave, aisles, and transepts, the arcade supported on polished pillars of red granite. Accommodation is provided for 1,000 persons, the cost not to exceed 7,000*l*.

Gateshead Workhouse.—At a meeting of the Gateshead Board of Guardians, held on Tuesday, the 19th ult., the designs submitted in open competition by Mr. W. Lister Newcombe, F.R.I.B.A., of Newcastle-upon-Tyne, for proposed additions to the Workhouse, Union-lane, were selected as the best, and received the first premium.

Lincoln's-Inn Chapel.—We are informed that in extending Lincoln's-inn Chapel westward, with a new staircase and vestries, in general accordance with the late Sir Gilbert Scott's design, made in contemplation of the removal of the old and almost ruinous chambers which enclose the end of the chapel, and contains its staircase, Mr. Salter, who designed the last alterations at King's College, London, and at St. George's Hospital, is employed as architect. Messrs. Longmire & Burge's tender has been accepted to complete the work in fifteen months.

PATENT RECORD.*

APPLICATIONS FOR LETTERS PATENT.

3,091. T. R. Harding and T. W. Harding, Leeds. Fluid meters. July 15, 1881.

3,107. H. J. Haddan, Kensington. Heating apparatus. (Com. by J. F. Lebreton, Besançon, France.) July 16, 1881.

3,114. W. R. Lake, Southampton-buildings. Construction of roofs. (Com. by J. Schieder & C. Polzer, Vienna.) July 16, 1881.

3,115. F. Worth, Frankfort-on-the-Main. Apparatus for flushing water-closets, &c. (Com. by G. Mack, Frankfort.) July 16, 1881.

3,156. T. E. Parker, Battersea. Open fire-grates, &c. July 20, 1881.

3,170. R. R. Gibbs, Liverpool. Cooling, &c., air. July 21, 1881.

3,183. W. Cunnington & W. Cunnington, jun., Chelsea. Decoration of paper-hangings. July 21, 1881.

NOTICES TO PROCEED

have been given by the following applicants on the dates named.

July 19, 1881.

529. B. C. D. Greenhill, Puriton. Machinery for pressing with perforations bricks, tiles, &c. Feb. 8, 1881.

1,155. S. J. Payne, Charlton. Manufacture of firebricks, &c. March 16, 1881.

July 22, 1881.

1,457. R. H. Reeves, Parkhurst. Ventilating apparatus. April 2, 1881.

1,618. G. E. Wilson, Leeds. Latches and locks. April 13, 1881.

2,837. K. W. A. Leverkus, Manchester. Ventilators, &c. June 30, 1881.

ABRIDGMENTS OF SPECIFICATIONS

Published during the Week ending July 23, 1881.

4,768. J. Couper, jun., Glasgow. Decoration or ornamentation of glass for panels of grates, &c.

The design is produced on the inner surface of the glass. (*Pro. Pro.*) Nov. 9, 1880. Price 2d.

4,938. W. Wyman, Gloucester. Gas-stove for heating and ventilating.

Four concentric metallic shells are arranged within each other, closed at the top and bottom, so as to form two annular chambers, which communicate with each other. These chambers are heated by gas-jets beneath and the heated air is allowed to flow from the chambers into the room to be warmed. Nov. 27, 1880. Price 6d.

5,120. C. E. Gibson, Birmingham. Holding and regulating window-blind cords.

A cradle-plate is fixed to the frame, to which is attached a carrier, having two grooved rollers, which are pressed against the plate by springs. The cords are passed round these rollers, which are held in position by the springs, regulated by a screw and nut. Dec 8, 1880. Price 6d.

5,164. E. Brooke, Huddersfield, drain-pipes, &c.

Ribs or bars are formed outside the pipes, so as to keep them true when in position, and the joints are made by segments of circles of the same size as the pipes, being formed of cement and introduced into the socket. Dec. 1, 1880. Price 4d.

5,195. H. S. Snell, Southampton-buildings. Smoke-consuming grates or stoves.

This relates to that class of grate which revolves on a pivot at the back thereof. The cylindrical sides are solid metal instead of bars, and the pivot is fitted with a number of friction rollers. A spring handle is used to revolve the grate and the covers have each a locking-bar attached. Dec. 11, 1880. Price 6d.

5,212. B. Banks, Leeds. Ash-pans for fire-places.

The ash-pan is divided into two chambers by a horizontal grate which arrests the cinders, but allows the ashes to fall through to the bottom. Dec. 13, 1880. Price 6d.

5,215. W. Edes, Dover. Sewers and drains.

The upper part of the sewer or drain is perforated with small holes to allow of the escape of the gases. Dec. 13, 1880. Price 6d.

5,220. J. R. Pickard, Leeds. Fire-grates.

Chambers are formed near the grate into which the gases pass and mix with the air, whereby the carbon is entirely consumed. Dec. 13, 1880. Price 6d.

5,230. W. P. Thompson, Holborn. Hiding or filling up corners or skirtings of rooms or staircases.

A plate is cut or stamped out so as to fill the corners and prevent dust accumulating. (Com. by D. McFee, R. A. Kelloud, and D. E. McFee, Canada.) (*Pro. Pro.*) Dec. 14, 1880. Price 2d.

5,266. W. Verity & B. Verity, Euston-road. Apparatus for withdrawing or forcing air for ventilating, &c.

A cylinder surrounds the central inlet opening of the revolving fan, within which are screw blades attached to the axis of the fan, which in their revolution draw in a supply of air to the fan casing. The ends of the axis are mounted in oil vessels to diminish the friction. Dec. 15, 1880. Price 6d.

5,284. O. Seydell, Birmingham. Supplying pure air to cities, towns, &c.

The pure air is collected from the sea-shore or rural district, and pumped into pipes which are led to the town to be supplied, where there are branches off the main pipe to each house, &c. Dec. 16, 1880. Price 4d.

5,290. B. J. B. Mills, Southampton-buildings. Paving roads, &c., with wood.

The blocks are formed with a groove across their base, and are coated with plastic waterproof coating, made of gas pitch, coal tar, mineral oil, sulphur, and resin. They are mounted on a foundation of artificial fusible lava, consisting of pulverised stone, pitch, asphalte, mineral tar, resin, scoria, and lime, which are heated up to 160° centigrade and made into blocks. These being placed in position are sealed to each other by mortar or lava. (Com. by A. Trenaunay, Paris.) Dec. 17, 1880. Price 8d.

ELY CATHEDRAL GRAMMAR SCHOOL.

OPENING OF NEW BUILDINGS.

An important educational movement has been going on for some years in the diocese of Ely, with the object of re-founding the Cathedral Grammar School as a Public School on a sufficient scale to meet the educational requirements of the diocese. On the 27th ult. some extensive new school buildings, which have been erected under a scheme issued by the Charity Commissioners, were formally opened by the Bishop of Ely in the presence of a very large and influential company. An interesting address was delivered by Dean Merivale on the occasion, tracing the history of our cathedral schools from the time of the Middle Ages, and showing the important part which they were designed to play as centres of religious education. By the reconstruction and expansion of the cathedral school at Ely provision is now made for 100 boarders, the new buildings being replete with all modern appliances. The cost of board and education is fixed at 51*l.* a year, and it is proposed to reduce this sum in favour of the poorer clergy and professional men by donations of scholarships of 25*l.* a year, the Bishop offering to maintain one for clergymen's sons.

The plans were prepared by Messrs. Carpenter and Ingelow, and the works have been carried out by Mr. S. Foster, of Kempston.

The new building, or Hereward Hall, as it is to be called, is built in the fourteenth-century style, of red Suffolk brick with Bath stone dressings, and forms, together with the new Theological College, an important addition to the architectural features of the city. It is situated opposite to the Ely Porta, built by Walpole in the fourteenth century, which is used as the large school-room, and stands on the site of the old Pilgrims' Hostelry. It comprises large, handsome, and well-arranged dormitories for 60 additional boys, with a good-sized library, preparation rooms, private studies, masters' and matrons' rooms, sick quarters, and, in fact, all the accommodation with the best modern arrangements, which are now considered suitable for our large public schools.

Some alterations are also being made in the old block of buildings, formerly the monastic dormitory. It is a building of early Norman date, raised and altered by Alan de Walsingham. He divided the stories by stone vaulting in small square bays, with columns down the centre. This crypt is used as the dining-room, and is now being lengthened by the removal of modern walls, so as to accommodate in addition the sixty boys of the new hostel.

The great dormitory above is being restored and divided into cubicles, and other improvements are being made as an instalment of more extensive works to be carried out in the future.

THE CHAPEL OF ST. ANNE'S SCHOOL, ABBOT'S BROMLEY.

St. Anne's School is erected for the education of girls of the middle and lower-middle classes. It is in connexion with the College at Lancing, and under the charge of the Provost of the Midland County Schools, with a lady resident, and mistresses under. The school, when completed, will accommodate 100 girls. Certain old buildings which were acquired have been enlarged, and a new wing built. A portion of the chapel, including the reredos, was first erected as a memorial, and it, with its ante-chapel, is now completed. It is of narrow but very lofty proportions, and is lighted by a series of two-light windows. The ante-chapel has an organ-gallery. Each story opens into the chapel by an arcade of three arches, and there is a large rose-window over the roof of the ante-chapel. On the north side is the bell-turret, finished with open arcaded work, and a shingled spire. The material is local brick, purposely made to a thickness of 2 in. The dressings are of Bath stone. The floor-tiles are the gift of Mr. Minton Campbell. The contractor is Mr. Yates, of Shifnal, the architects being Mr. R. Herbert Carpenter and Mr. B. Ingelow, and the clerk of works Mr. Tompson. The reredos, with sculptured figures of alabaster and Mansfield stone, has been executed by Mr. Hill, of Chelsea, from the architects' designs.

COOKING BY GAS.

The Welshpool Gas Company have recently held an exhibition which is certainly a new departure from the accepted traditions, and which deserves to be repeated by every gas company in existence. Taking stalls in the Welshpool market, they fitted these up as a small temporary *restaurant*, with the domestic cooking apparatus made by Mr. Fletcher, of Warrington, not, however, confining themselves to one maker exclusively, but exhibiting a fair selection. They offered at the conclusion to put up any of the apparatus free of charge for any person to whom they supplied gas. That the idea was a success may be proved by the fact that all the apparatus in use was sold at the conclusion. Their profit on the apparatus should be ample to more than pay all expenses, and they have secured a number of permanent customers for their gas, who, it is probable, would never have adopted gas cooking if they had not been invited to "taste and try before they buy." An exhibition of this kind is simple, useful, and pays everybody concerned, both sellers and buyers, and wherever it is repeated is sure to attract numbers of interested observers. It might probably pay any dealer in gas-cooking apparatus to repeat the experiment in his own town; but it is certain to pay any gas company, as they not only get the dealer's profit on the apparatus, but also—what is far more important—a number of permanent customers for their gas, who are of a peculiarly valuable class, as their gas consumption would be in the day time and most in the summer, at the times when all gas-works are partially lying idle, eating their heads off with establishment expenses and interest of capital on unemployed plant.

To people who have a chronic habit of grumbling at their gas bills, the following may be of assistance in both clearing up the cause and reducing the bills at the same time. Some months ago a family whose gas bill for lighting only amounted to over 5*l.* per day (130 cubic feet), asked Mr. Fletcher, of Warrington, to supply them with a complete gas cooking apparatus. On being asked what the probable cost of gas for cooking would be for a family of seven, he gave it as about 1½*d.* per day as a maximum. This statement was looked upon as an absurdity, and to catch him napping the meter was closely watched day by day at different hours. The consequence was that the meter dial was seen to be constantly on the move, even when no gas was used. An examination was made, and a considerable leakage was discovered and made good. When this was made right, the gas consumption, as indicated by the meter, at once dropped to 72 cubic feet per day,—less than 3*d.* for both lighting and cooking. As this reduction was brought about indirectly by the introduction of gas cooking, it may practically be said that the cooking costs 2*d.* less than nothing per day. Immediately behind the dial of a gas-meter, in the same little box, will be seen a small horizontal drum, with the figures 1 and 2 on it. This drum revolves once for every 2 cubic feet passing, and those who doubt their gas bills can easily see for themselves whether any gas is passing when all the taps are turned off. If when no gas is being used this drum revolves once in half an hour, the waste of gas at 3*s.* 6*d.* per 1,000 cubic feet will be equal to 4*d.* per day, or about 6*l.* per annum. If the drum revolved once in two hours with all taps closed the leakage would be quite sufficient to pay the expense of a thorough search for it, and show a handsome profit. Most people have an idea that if there is any leakage of gas they would be sure to smell it. This is a mistake; leakages of the worst kind occur frequently under floors which have often a free current of air passing, these leakages being often caused by nailing carpets, &c., down, and from the free ventilation underneath the leakage is not at all likely to be discovered except by the movement of the meter. As the watching of the meter is a simple matter, costing nothing, the suggestion is one which is well worthy of attention.

INTERNATIONAL ARCHITECTURAL COMPETITION AT ST. PETERSBURG.

A COMMUNICATION has been received from the Foreign Office, in a letter from Lord Tenterden addressed to the President and Council of the Royal Institute of British Architects, to the effect that British architects are invited to join in a competition for a church to be erected at St. Petersburg, on the spot where his late majesty the Czar was assassinated. The Institute of Architects publish in No. 19 of their "Proceedings" a translation of the official particulars given in the *Journal de St. Pétersbourg*, and this translation has been reprinted in the daily papers, so that it is scarcely necessary for us to repeat the particulars here. Applicants at the rooms of the Institute, 9, Conduit-street (where a plan of the site may be seen) will doubtless be able to obtain complete copies of the conditions.

COMPETITIVE DESIGNS FOR CHRISTMAS CARDS.

THE following is a list of the competitors to whom the judges have awarded prizes:—

First Prize, 150*l.*—Linnie Watt.
Two Prizes, 100*l. each.*—Caroline Paterson and Harriet M. Bennett.
Two Prizes, 75*l. each.*—E. A. Lemann and Harry Arnold.
Five Prizes, 50*l. each.*—Miss S. A. Ashworth, Alice C. Swan, Linnie Watt, Edgar Giberne, and A. M. Chambers.
Ten Prizes, 25*l. each.*—H. Sterling, Catherine A. Sparkes, Henry Anelay, Ellis Wilkinson, Archibald Thorburn, Mrs. J. W. Whymper, E. B. S. Montefiore, Frank E. Cox, Mrs. J. W. Whymper, and Brinsburst B. Lawrance.

To fifty of the other competitors the Messrs. Hildesheimer & Co., who instituted the competition, have awarded prizes of 20*l.* each. The ladies have again taken off the largest proportion of the amount offered,—1,100*l.* against 900*l.* to men.

NEW PAROCHIAL SCHOOL BUILDINGS AT LEYTONSTONE.

THE St. Matthew's Bethnal-green Board of Guardians are erecting new parochial schools in connexion with the parish of Leytonstone, and last week the memorial-stone of the first portion of the schools was laid by Mr. Collins, chairman of the Board. The accommodation to be provided in the first instance consists of a school-house for 500 children, and of six semi-detached houses, constructed on the group or cottage-home principle, each to accommodate 48 boys. The cottages for the girls and infants will be built afterwards. The architects of the schools are Messrs. A. & C. Harston, and the builders are Messrs. Jackson & Todd, of Hackney, the amount of whose contract is 11,570*l.* Mr. Geo. Poole is clerk of the works.

SALES OF BUILDING LAND AT THE AUCTION MART.

THERE were several important sales of suburban mansions and building estates at the Auction Mart last week. Messrs. Baker & Sons submitted to competition a freehold property at Willesden, called the Roundwood Park Estate, comprising two private residences, and 92 acres of land, which the auctioneer stated was most eligibly situated for building upon, being in one of the best parts of Willesden, and within a convenient distance of more than one railway station. After a close competition it was sold for 33,590*l.* Subsequently Messrs. Baker offered for sale Priory House, Southgate, with two acres of freehold land attached, which were sold for 3,160*l.*

Messrs. Brown, Roberts, & Co., likewise submitted for sale several freehold properties in Penge and Sydenham, the most important of which was 31 acres of building land in Penge, which after an animated competition was sold for 44,355*l.*, being at the rate of upwards of 1,400*l.* an acre. The same auctioneers likewise sold freehold ground-rents in Sydenham, amounting to 237*l.* per annum, for 7,115*l.*

Messrs. Glaisher & Sons also offered for sale the St. Helena-gardens Tavern, at Rotherhithe, containing four acres of freehold land. The property, which was described as of great value as a site for the erection of either business premises or private houses, was sold for 11,750*l.*

COST OF MODERN BUILDINGS.

IT is interesting to compare the cost of some of the most recent buildings of the present day. The new Grand Opera at Paris cost 40,000,000 francs; the new Hôtel de Ville, 40,000,000 francs; the new Paris Post Office, 30,000,000 francs; extension of the Conservatoire of Music, 8,000,000 francs; the new Museum of Victoria, Australia, 100,000*l.*; the Maison du Roi, in the Brussels Market-place, 2,000,000 francs; the new Provincial Government Buildings at Bruges, 2,000,000 francs; the Brussels Cavalry Barracks, 4,000,000 francs; the new Brussels Mint, 4,000,000 francs; the Palais des Beaux-Arts at Brussels, 3,000,000 francs; the new Museum at Antwerp, 2,000,000 francs; the Palais de Justice at Brussels, 40,000,000 francs; and the Department of Justice Building at the Hague, 1,700,000 francs. We may compare with the above the cost of the following buildings in the United Kingdom:—The Houses of Parliament at Westminster cost 3,500,000*l.*, or 87,500,000 francs; the new Foreign Office, Whitehall, 550,000*l.*; the Record Office, 120,000*l.*; and the Law Courts are estimated, exclusive of special fittings, at nearly 900,000*l.*

FIRE IN THEATRES.

A COMMISSION was recently appointed by the city of Vienna to report on the state of the theatres, with special reference to the possible occurrence of a similar disaster to that of Nice. In commenting on the recommendations of the commission, one of the leading authorities on the subject, Herr Orth, has called attention to the necessity of limiting the use of wood to parts of the building where it is absolutely necessary, and of employing iron and stone where it is possible to do so. He further suggests that such woodwork as is indispensable should be made as safe as possible by one of the known anti-inflammable processes. The suggestion is also made to have fireproof rooms near the stage for the temporary security of the staff of the theatre in case of fire.

ARCHITECTS' ACTIONS.

LINDLEY *v.* KNIGHT.

WM. JOHN LINDLEY, surveyor and architect, of Colne, sued Calvin Knight, manufacturer, of Colne, for 10*l.* 16*s.* 8*d.*, balance of an account of 15*l.* 16*s.* 8*d.* cost of plans.

Mr. J. Sutcliffe, Burnley, appeared for the plaintiff, and Mr. T. Nowell, Burnley, for the defendant.

The plaintiff was called, and he stated that on the 12th of November, 188?, he received instructions from the defendant as to plans for a house to be erected near houses which his brother, Mr. A. Knight, the defendant, was building. The defendant called upon witness on the 18th of November, and altered the plan. Other interviews between the defendant and plaintiff took place, and the plans were several times again altered, and ultimately the various works were advertised as to be let, but the building was not gone on with. The defendant had paid 5*l.* on account.

Cross-examined, the plaintiff said that the plans had not been touched since the 16th of December. The plans were advertised to be seen on the 13th of December, and the tenders (were to be received by the 22nd. The plans were stopped on the 17th of December. Since then Mr. Knight had erected a house somewhat similar to that projected one for which witness prepared plans.

Thomas Watson, architect, of Burnley, said that he had seen the plans prepared by the plaintiff. As the house was now, he valued it at about 1,400*l.* at least, and he thought 1½ per cent. would be a very fair charge; this would amount to 17*l.* 10*s.*

William S. Varley, architect, of Blackburn, also spoke in support of the charge made by the plaintiff.

For the defence, Mr. Nowell complained that the plaintiff failed to have the plans ready according to arrangement, and even when the works were advertised he kept the contractors waiting, and upon this account Mr. Knight had been compelled to engage another architect.

The defendant, Calvin Knight, was called, and he said that he gave the plaintiff particulars of the house he wanted building, just as the plaintiff had already said. He laid particular stress upon the condition of regularity, for if this was not complied with he told the plaintiff they would get across. Three or four times after the 13th of December witness called upon the plaintiff, once about the 22nd, the day upon which the tenders should have been received. The plans, however, were not ready. He stopped the work on the Friday after the day fixed for receiving the tenders.

Smith Whitehead, surveyor, after examining the sketches produced in court, thought they were the work of two or three days.

His Honour, in giving a verdict for the plaintiff, said he had in his opinion gone about his work in a very business-like and professional way. The fact that the plaintiff had also on hand work for defendant's brother, who was equally urgent with himself, he took to be a reasonable excuse for the delay which had occurred in the preparation of the defendant's plans. The plaintiff had from beginning to end given his evidence in a very straightforward manner, and his diary and call-book confirmed his consistency. As for the evidence given by Mr. Knight as to seeing the plaintiff on the Friday after the 22nd of December, he thought Mr. Knight must be labouring under a delusion, for the day must have been, as the plaintiff had said, and as his diary also said, the 17th. Mr. Knight had clearly been mistaken in the day.

LANDLORD AND TENANT.

AN important case as bearing on the rights of landlord and tenant, was heard last week at the Clerkenwell County Court, before Mr. Gordon Whitbread, the judge. The plaintiff was Mr. Doyle, a tenant of Mr. Wood, the defendant, and the action was brought to recover 9*l.* 10*s.*, being damage sustained by the plaintiff occasioned by the defendant's neglect, as landlord of the house, to repair certain defects in the roof. It having been proved in evidence on the part of the plaintiff that the defect in the roof of the house had caused injuries to the plaintiff's furniture, and that the landlord, although requested to do so, had failed to make the necessary repairs, it was submitted for the defendant that at the time the plaintiff took the house there was no specific contract entered into by the landlord to keep the roof in repair, and that, therefore, he was not liable for the damage which the plaintiff had sustained by the defects in the roof. It was admitted by the plaintiff that there was no such specific contract, but it was contended on his behalf that it was, nevertheless, the duty of the landlord to keep the fabric of his property in repair, and that he was responsible for the damage which had been caused by failing to repair after notice to do so.

Mr. Whitbread, in giving judgment, said that according to the law, as laid down in "Woodfall's Landlord and Tenant," the landlord, in the absence of any express covenant, was not liable to do any repairs whatever to the house. The plaintiff must, therefore, be nonsuited, with the costs of the defendant.

FIRE!

SIR,—I beg to submit a plan of mine to prevent or retard conflagrations. Flooring-planks can be made non-inflammable by pasting the boards before nailing them down; or two thin boards, paste to paste, to permanently enclose the paste. In the event of a fire, planks, laths, &c., so prepared, will not aid in destruction, and prevent extending.

I use no acids, which destroy wood; no impediment to carpenters' and painters' work; no smell or discoloration, nor extra expense. For stairs, ship-fittings, and timber in mines, it may be invaluable. I propose to supply the planks ready, or the paste, for the workmen to brush it on themselves.

R. T.

FIRE PREVENTION IN THEATRES.

SIR,—I am aware that there are several public buildings, notably theatres, which are amply provided with fire-extinguishing appliances, but is there one of the particular class to which my heading points fitted with proper indicators? I would suggest that such buildings having tanks only should be fitted with an electric bell-alarm (the same to be in the manager's room), and when the water gets at "half-full," which should be plainly written on the indicator, the bell should sound, or in the event of the fire-hydrants being connected to the street mains a similar contrivance should exist. Water in such buildings is frequently drawn off from the tanks for "water scenes" and other purposes; hence the imperativeness of the arrangement suggested herein. Besides this, managers frequently are changed.

J. C. MERRYWEATHER.

The Guardians of the Parish of Chelsea, with the assistance of the powers of the Land Clauses Act, conferred on them by the Metropolitan Poor Act, 1867, with which the former Act is incorporated, have, after publishing the statutory advertisements and giving the necessary notices, arranged for the purchase by agreement of the block of property adjoining and bounded on the west side by Chelsea Workhouse, on the east side by Robert-street, and on the north and south sides by Britten-street and King's-road respectively. The property includes thirty-six houses, a cab-yard and stables, and the infirmary-stables of the London General Omnibus Company. The freeholders were the trustees of the Duchess of Somerset's Westminster Charity. The property is taken for the enlargement of the Workhouse. Messrs. A. & C. Harston, of Leadenhall-street, conducted the negotiations on behalf of the Guardians; Messrs. Debenham, Tewson, Farmer, & Co., Mr. G. A. Wilkinson, and Messrs. Fuller, being the surveyors between whom the claims of the vendors were distributed. Plans for the Workhouse extension are now being prepared by the architects, Messrs. A. & C. Harston.

GLASGOW MUNICIPAL BUILDINGS COMPETITION.

Sir,—It may be of interest to those of your readers who intend to send in competitive designs for the new municipal buildings for this city to know that the committee on new municipal buildings,—acting under full powers from the Town Council,—on the 11th ult. appointed Mr. Charles Barry, architect in London, and Mr. John Carrick, City Architect, Glasgow, (1) to select from the designs in the preliminary competition those the authors of which shall be invited to compete in the second and final competition; (2) to advise the Magistrates and Council in the selection of the four best designs submitted in the final competition; and (3) to advise on the probable sufficiency of the estimates submitted by competitors, all in terms of the fourth paragraph of the conditions of preliminary competition.

J. D. Marwick.

THE ENGLISH LAND SYSTEM.

Sir,—All the highest authorities agree in that the system of land tenure in which the farmer is proprietor of the soil he tills is the most perfect and successful, and this has been proved by the comparisons instituted between the present condition of agriculture in several countries with the peasant-proprietor system of land tenure, and the position of agriculture in those countries under the feudal system. The instances quoted by your correspondent in his interesting letter of the 16th ult. [p. 93, *ante*] are worthless as evidence against the peasant-proprietor system. Probably the yeomen mentioned entered on a farming speculation with inadequate capital and following, and insufficient mechanical appliances; or perhaps the soil was intrinsically bad and unfit for cultivation, except with an excessive outlay. There are other circumstances which may have occurred which would produce failure. Of course, any system of land tenure, *per se*, will not remedy the deficiencies enumerated, such as, for instance, to render a barren soil prolific; although in the case of that great and worthy example of farming, Mr. Mechi's Tiptree farm, we see what science can do in the way of improving a comparatively poor soil.

My suggestions for the recuperation of England's agricultural resources are as follow:—

1. Such an alteration of the land laws as would make it possible for any farmer to become possessed of the land he cultivates in a certain number of years, and make it as easy and inexpensive to transfer land as any other description of property.

2. The appointment of a Minister of Agriculture, who should be required to issue statistics and other information of interest to the agriculturist.

3. The establishment of Chairs of Agricultural Science at our universities and colleges.

4. The diffusion of the knowledge of agricultural chemistry amongst farmers.

5. An agricultural Ordnance map of England, based on the principle of the 1-in. geological Ordnance map, showing the relative excellences of various geographical positions for the production of various descriptions of agricultural produce, &c.

6. A further development of the present excellent system of diffusing barometrical predictions, so that every farmer may be able to safely predict the state of the weather,—a knowledge of incalculable value in harvest time.

7. A general re-arrangement of railway tariffs for the carriage of agricultural produce. Tariffs at present are both irregular and exorbitant, and place English farmers at a great disadvantage in competing with foreigners.

8. The utmost possible adoption of mechanical labour-saving appliances.

If these foregoing suggestions were carried out, and I think they are within the domain of practicability, the immediate future position of English agriculture would become permanently safe and prosperous; and English yeomen would have little need to fear that the price of produce from Manitoba and the Far West would preclude them from farming with a fair average profit.

It is important and necessary that the English agricultural societies should have some programme of reform. The suggestions embodied in this letter may prove useful in the course of formulating such a programme.

B. H. Thwaite, A.M.I.C.E.

DISSENTING CHURCH-BUILDING NEWS.

Chesterfield.—A new Primitive Methodist church is to be erected here. The design is Early Gothic. The architect is Mr. Councillor Jno. Wills, of Derby; the contractor is Mr. Joseph Munks, of Hucknall. The cost will be about 2,200*l.*

Long Eaton.—A new Wesleyan chapel is to be built at Long Eaton. Mr. Jno. Wills, of Derby, is the architect. The design is in the Italian style, and the work is to cost nearly 2,000*l.*

VARIORUM.

The May number (1881) of the "Transactions of the American Society of Engineers" (vol. x.) is wholly devoted to the consideration of Wind Pressure upon bridges. It includes a paper on the subject by Mr. C. Shaler Smith, member, and a full report of the discussion which followed.——"The Mechanical Engineer's Office-Book: Boiler Construction," by Nelson Foley (Crosby Lockwood & Co), is designed to facilitate work in offices and to give an accurate method of arriving at results without repeating the same calculations over and over again. It is full of diagrams.——The current number of The *Nineteenth Century* includes a paper on "The Arab Monuments of Egypt," in which the writer, Mr. Frank Dillon, seeks to awaken an interest in their preservation. "The mosques of Cairo," he rightly says, "and the examples of domestic architecture which yet remain, are evidences of the high position attained to by their designers, and justify the dismay with which their neglected condition fills the mind of all who are capable of appreciating their beauty. It is a sad commentary upon the boasted civilisation of a century now drawing to a close that no hand has yet been lifted to avert the doom of some of the choicest monuments existing in the world." We cordially agree with him in hoping that this question may be taken up by competent hands, and not allowed to languish for want of active support from those able as well as willing to further so desirable an end. Cairo of late years has been desecrated and disfigured, and ruin is impending over many of the Arab monuments that still remain.——The *Antiquary* (Elliot Stock), has reached its third volume, and this is now before us. It is well printed, on the fashionable paper of the day, with uncut edges, and is full of matter interesting to those who are devoted to the study of the past, with an occasional touch for those who care most for things present, as when Mr. Parker launches out against the conceit of modern English architects and the "bumptiousness" of English engineers (pp. 152, 153). It is now edited, we believe, by Mr. H. B. Wheatley, F.S.A., and is carried on with much spirit.—— The *St. James's Magazine* appears to have entered upon a fresh lease of life. The August number contains pleasant reading.——In the August number of the *Art-Journal* Mr. G. T. Robinson continues his interesting series of papers on "Our Household Furniture: its past History and its present Development." In this he treats of seats, including amongst his illustrations sketches of three in Mr. Godwin's collection of chairs, viz., Anne Boleyn's, Shakspeare's, and Theodore Hook's. Amongst other illustrations in the number is a coloured plate of Satsuma Faïence.——"Birchington-on-Sea and its Bungalows," by Athol Mayhew, with "An Historical Sketch of Thanet," by S. W. Kershaw, M.A., although a very little book, contains a large amount of information on the locality of which it treats. It contains a full account, with illustrations, of the Birchington Bungalows, as built under the direction of Mr. John Taylor, and which were long ago described in the *Builder*. Mr. Kershaw adds some pleasant reading on the Island of Thanet generally. Birchington's important and close neighbour, Westgate, is made conspicuous by the all but entire absence of any mention of it in the neat little book, which looks a little like jealousy.——Part III. of "English Etchings" (185, Fleet-street), includes a subject called "On Strike," by Percy Thomas. It is cleverly executed and an interesting picture, but would scarcely tell its story without the placard on the wall.

The Christchurch Rural Sanitary Authority have requested Mr. J. H. Moore, C.E., Bournemouth, to submit to them a scheme and report on the best mode of draining Westbourne, a new populous district near Bournemouth.

Miscellanea.

Technological Handbooks.—Messrs. Geo. Bell & Sons are preparing for publication a series of Technological Handbooks for the use of candidates in the technological examinations which, instituted by the Society of Arts in 1873, were in 1879 transferred to the City Technical Institute. The rapid increase in the number of candidates since the examination scheme was remodelled, and since the examinations have been supported by the friends of the associated Guilds, is considered to justify the expectation that these handbooks will be successful, since it shows that there are many artisans and others who are seeking to make themselves familiar with the theory of their special industries. It is intended by the publishers eventually to include in the series all the industries specified in the programme of the City Institute; but at first those branches of manufacture have been selected for treatment in which it appears that text-books are most required. In accordance with this idea, six books are now announced for publication:—"Calico Bleaching, Dyeing, and Printing," by William Crookes, F.R.S., V.P.C.S.; "Iron and Steel Manufacture," by A. K. Huntington, F.C.S., F.I.C., Professor of Metallurgy at King's College, London; "Telegraphs and Telephones," by W. H. Preece, F.R.S., Memb. Inst. C.E., Electrician to the General Post Office; "Cotton Manufacture." Part I., Spinning; Part II., Weaving; by R. Marsden, Editor of the *Textile Manufacturer*; "Glass Manufacture." Crown, Sheet, and Plate Glass. By Henry Chance, M.A. (Chance Bros., Birmingham); Flint Glass, by H. Powell, B.A. (Whitefriars Glass Works); Optical and Lighthouse Glass, by John Hopkinson, M.A., LL.D., F.R.S. The series is issued under the general editorship of Mr. H. Trueman Wood, the Secretary of the Society of Arts.

The City Companies.—At the invitation of the Courts of Assistants of the Carpenters' and Drapers' Companies, a large party of artisans connected with the building trades on Saturday visited the halls of these Companies to inspect their architectural and structural features. At Carpenters' Hall, which has just been rebuilt, they were conducted over the building by Messrs. Alfred and Stanton Preston, the warden and Clerk, and shown the Court-room, which contains panelling removed from the old hall, which was built in 1629, and escaped the great fire. This room also contains a noble chimney-piece, carved by Grinling Gibbons, and in an adjoining apartment are preserved some ancient wall-paintings, which were discovered a few years since, and have been carefully restored. In the banqueting-hall a ceiling, reproduced from one designed by Inigo Jones, was pointed out. The party then repaired to Drapers' Hall, where they were met by Mr. Barrow (one of the Court of Assistants), the surveyor (Mr. Reilly), and the clerk (Mr. Sawyer), by whom they were shown over the premises, rebuilt about ten years ago on the site of a mansion belonging to the Earl of Essex, attainted under Henry VIII. The works having been technically explained to the visitors, they separated, first expressing their thanks to the Companies for the kindness and instruction they had received.

Billingsgate.—A scheme for the improvement of Billingsgate Market has been suggested by Mr. W. E. Heath, and has been published by Mr. S. Clark, Paternoster-row. It involves a viaduct from Eastcheap to the market, the upper part of which it is proposed to remove, and to form upon the internal columns a flooring or roadway over the entire area, pierced with staircases and wells for hydraulic lifts, which would take ordinary packages, and others for loaded vans and carts; a bridge or viaduct would be thrown over Lower Thames-street, at the western end of the market. Plans accompany the scheme, and we are bound to add that they do not lead us to suppose that the scheme ought to be carried out.

Ilford.—A new burial-ground, for the Great Ilford Burial Board, was consecrated on the 21st ult., by the Lord Bishop of St. Alban's. The ground is about four acres in extent, and is in the rear of St. Mary's Church, on the Romford-road. It has been enclosed, laid out, and drained, and a chapel built thereon, from the designs and under the superintendence of Mr. C. J. Dawson, architect, Barking. The contractors were Mr. Impey, of Leytonstone, for laying out and draining the ground, and Mr. C. Mills, of Ilford, for enclosing the same, and building a chapel.

Fine Art and Industrial Exhibition at Cardiff.—An exhibition of paintings, sculpture, engravings, drawings, porcelain, machinery, &c., was opened at the Drill-hall, Cardiff, on the 29th ult., by the Mayor (Mr. Rees Jones), who delivered a short address, referring to the object in view in holding the exhibition, which was to provide means for furnishing the new free library building now in course of erection, and expressing a strong hope that the object sought for would be realised. The exhibition as a whole is reported to be an extremely good one. The number of paintings, both ancient and modern, is very large, covering all the walls of the spacious building, and there are many still to be hung. Among the exhibitors of modern paintings are MacCallum, Vicat Cole, Dumonier, Edwin Hayes, Claude Calthorpe, Holyoake, T. K. Pelham, Benjamin Leader, John Mogford, J. Buxton, Knight, Rook, Carl Haache, Otto Weaver, Mrs. Murray, J. G. Philp, E. K. Johnson, E. J. Soper, A. P. Newton, and many others; and among the works of the ancient masters are paintings ascribed to Holbein, Rembrandt, Hobbema, Gerard Douw, Guido Reni, Pannini, and many others. The South Kensington Museum sends a series of water-colour drawings illustrating the progress of art from the early part of the eighteenth century until the present time. The Right Hon. W. E. Gladstone sends a large case of works in Achin ivory; Sir E. J. Reed, M.P., sends a large number of curiosities, in addition to several valuable paintings; the Marquis of Bute contributes several paintings by Hobbema, Holbein, Rembrandt, and others. There is also an extensive display of china, porcelain, woodcarvings, and furniture.

The City Day Census.—At the meeting of the Local Government and Taxation Committee of the Corporation, Mr. W. Lawley, the chairman, and Mr. B. Scott, Chamberlain of London, presented their preliminary report of the City Day Census, taken three weeks after the imperial census of this year. We are informed that the figures may be slightly altered after final examination and check. Total residents, occupiers, and persons employed, 1881:—Males, 25,287; females, 44,095; children, 21,288,—total, 260,670. The imperial census gives for the resident night population alone on Sunday night, April 4, 1881:—Males, 25,085; females, 25,441,—total, 50,526. The mercantile and commercial population in 1881 is 210,144; in 1866 it was 170,133, being an increase of 40,011. The decrease in the night residents and caretakers since the Imperial census of 1871 is 24,371; the persons resorting to the City on foot and in vehicles is greatly increased; in 1881, in a day of 12 hours (5 a.m. to 5 p.m.), 589,468; in 1866, in a day of 12 hours (6 a.m. to 6 p.m.), 479,613,—an increase of persons, 39,855; in 1871, in a day of 16 hours (5 a.m. to 9 p.m.), 1,009,640; in 1866, in a day of 16 hours (5 a.m. to 9 p.m.), 679,744,—an increase of persons, 329,896. The rateable value of the City keeps pace with the increase of population. In 1868, when the last day census was taken, it was 3,009,935*l.*; it is now(1881)3,537,561*l.*,—increase, 527,626*l.*

The International Medical and Sanitary Exhibition.—The preparation of a design for a diploma to be awarded by the Parkes Museum in connexion with the Hygienic Exhibition now open at South Kensington, was entrusted to Mr. W. Cave Thomas. The design, which are told, includes a female figure, representing Sanitary Science, standing at the prow of a boat in the act of casting her "life buoy" (hygiene) into the seething ocean of human ills. On Monday next, Mr. Eric Erichsen and the Exhibition Committee will be present at the Exhibition during the afternoon to receive the members of the International Medical Congress. The Exhibition will finally close on the 13th of August.

Chart of the Workmen, to the number of twenty-five, of Messrs. Thos. C. Halliday & Sons, Leaders, of Greetham, Oakham, and Stamford, had an outing at Belmisthorpe on Saturday last, a band of music and good cheer helping in the day's recreation. Good feeling and good wishes were manifested both by employers and employed.

Builders' Machinery at the Melbourne Exhibition.—Messrs. F. W. Reynolds & Co., Ironwark, have been awarded gold and silver medals in addition to several honourable mentions for special and patent builders' machinery and appliances.

Improvements near the Houses of Parliament. — In the House of Lords on the 29th ult., Lord Lamington asked whether, before coming to any determination as to the contemplated improvements near St. Margaret's, Westminster, her Majesty's Government would consider how far it was desirable to carry out the recommendations of the Committee on Public Buildings of 1878. In the opinion of that committee, it would be economical to borrow 1,500,000*l.* However, he would leave that part of the report alone, and would only ask whether her Majesty's Government intended to take down the houses at the end of Parliament-street. The approach to the Houses of Parliament was now a disgrace to the country. Moreover, to leave it in its present state would lead to increased expenditure, as the Government would eventually have to pay more for the leases of the houses. The improvement of a great metropolis was a question worthy of the consideration of statesmen. The Earl of Kimberley, in reply, said that the subject was really under the consideration of the Government, which would, in a very short time, owing to the pressure from the War Office and the Admiralty for further accommodation, have to decide what scheme should be adopted for the extension of those offices, and that, of course, would involve acting on the recommendations of the committee of 1878.

The London Water Supply.—In the House of Lords, on the 29th ult., the Bishop of London presented a petition from the National Health Society, and asked whether any measures had been taken or were in preparation by the Government for improving the water supply of the metropolis. From his experience as a London clergyman, he believed that an insufficient supply of water, such as existed in many parts of London, was injurious to the cleanliness, and consequently to the temperance, the morals, and, in the last resort, the religion of the population. The working-classes living in the west of London were particularly ill-supplied. All the circumstances pointed to the necessity of avoiding further delay. It was admitted that the valuable property of the water companies must be bought at a fair price. To ascertain what price should be given, recourse might be had to arbitration. This initial step, he might add, could be taken without the intervention of an Act of Parliament. The Earl of Dalhousie said the Government fully recognised the enormous importance of this question, and it hoped and expected to deal with the matter next year.

Weston-super-Mare.—The new buildings erected for "The Masonic Hall Company," Limited, at Weston-super-Mare, are now almost completed, and will be opened next month. The works have been executed by Messrs. S. T. Harvey & Co. from the designs and under the superintendence of Messrs. Price & Wooler, architects. The new Church Institute, erected in the "Boulevard," Weston-super-Mare, was opened on Wednesday in last week. The contract was carried out by Mr. Robert Shorney, from plans prepared by the same architects.

The Chichester and Midhurst Railway. In connexion with our notice of this line we are asked to add that Messrs. W. S. W. Astbury & Co., of Manchester, Hull, & London, supplied all the oxide of iron paints, varnishes, &c., used for decorating the stations and bridges of the line.

TENDERS

For girls' school, for the East Grinstead School Board. Mr. S. W. Haughton, architect. Quantities by the architect:—

A Central Railway Station for London.

INSTITUTIONS, to thrive in England, must grow like indigenous plants. They rarely thrive if forced, or if brought ready raised from the hotbed of political theory. It is the oak or the elm, dotted irregularly over park or hedge-row, that is the characteristic timber of England, not the regular lines of carefully-planted larch or spruce. Thus it is that our railways have grown. Originally regarded with that distrust which was, fifty years ago, usually extended, in England, to any great novelty, they were arrested, perforce, in the suburbs of our great towns and cities. No one, it is safe to say, could at all realise in 1834 or 1835 how the new mode of conveyance would associate itself with the national life of the country. Thus for the London and Birmingham Railway, the first constructed south of the Trent, the directors were glad to avoid a great amount of opposition by stopping at Camden Town, then a rural suburb of London. The Great Western Railway, in the same way, stopped at Paddington; the Eastern Counties at Shoreditch. The Brighton was bolder than its neighbours, and in its close approach to London Bridge tapped the sources of its passenger traffic nearer to the centres of population than did any of the Northern lines,—a fact mainly due to the character of the district through which it was found possible to run a line.

Not that Robert Stephenson, Isambard Brunel, or any of their brethren, regarded these sneaking approaches to central *termini* as anything but makeshifts. Indeed, the London and Birmingham Railway was only just in course of construction when a Bill was obtained for an Extension to Euston-square. It was proposed that the Great Western line should form a junction with the London and Birmingham line at Wormwood Scrubbs, and that the two should have a common station at Euston. With this view land was taken, and works were contracted for, for a fourfold line from Camden Town to Euston. The accord came to nothing before the Euston Extension was completed; but the very proposal was of great service to the London and Birmingham line, as Mr. Stephenson had the courage and foresight still to construct this couple of miles of double width, notwithstanding the fact that it was no longer expected to carry a double traffic.

At the time when the Act for the Euston Extension was obtained, the country ran up as far as Drummond-street; the intervening distance to Camden-town running through market gardens, or cow-farms, and other neglected, but unbuilt-on suburban localities, having only the Hampstead-road and Park-street to cross, by subterranean galleries, as truly urban neighbourhoods. How the work of the builder has crystalled around the line thus run it is needless to point out. Our object in recording these memories is to show that at Euston-square, as well as at Paddington, Mr. Stephenson and Mr. Brunel merely utilised the nearest approach to the centres of population which could be found without running through streets and squares, to which the opposition then likely to be offered would have been certainly costly, and probably successful.

It thus happened that the London terminus for that grand system of communication, of which the 110 miles from London to Birmingham formed the nucleus or germ, is fixed at a spot which is one mile and three-quarters from Charing-cross, and two miles and a half from St. Paul's. We may take Charing-cross, to the West, and the Mansion House, to the East, as the two main centres of the passenger movement to and from London. It will be seen in a moment how severe a tax is imposed on every passenger by the London and North-Western Railway, in consequence of the locality of its terminus. The termini of the Great Northern and the Midland lines are not much more conveniently placed, although they were erected at so much later a period. But the Metropolitan line supplies a convenience to the customers of the two latter lines, which is not afforded to those by the North-Western.

It is now idle to speculate as to what would have been the actual condition of things had English people known as much of the advantages and disadvantages of railways in 1830 as they do in 1880. That the London and North-Western, Great Western, South-Western, South-Eastern, Brighton, and Great Eastern Railways would have had a common central station, is one of the conditions that would have probably resulted from an absence of urban opposition to the entrance of the locomotive, with its frightful noise, within densely inhabited localities. Or it might have seemed more practicable, the expense of purchase of property being regarded, to select two stations; one for the lines north, and the other for those south, of the river. In that case, our knowledge of the London of 1830 leads us to conclude that the central station for the western lines would have been probably situated somewhere between Lincoln's Inn-fields to the south and the Foundling Hospital and the County gaol to the north-west and north-east. The southern centre would have probably adjoined Blackfriars Bridge-road, either to the east or the west of that great line of thoroughfare. In the wish to avoid the great cost of a Thames bridge, these two northern and southern termini might have long remained without direct communication by rail. But when the time came for such a communication the great traffic would have allowed of an outlay that would have afforded a noble bridge and a convenient line of junction.

That, of course, is mere speculation. But the fact remains that the disjunction of the several metropolitan stations, as well as their suburban localities, imposes a heavy tax on most of the customers of these lines; and in the case of a through traffic, say for any one going from Birmingham to Southampton, or from Oxford to Colchester, forms a serious impediment.

Under the circumstances, the proposal, which has been recently brought on the *tapis*, of a central railway station for London, is one that deserves very serious attention. We are speaking without any prejudice for or against any particular project; indeed, we are disposed to hold that the frank acceptance of any such scheme by the directors of the great trunk lines must be one of the conditions necessarily precedent to any well-digested appeal to the public for support. But as to the need itself, it is so obvious that it seems to be that the main point for serious consideration is this: Would it be better, regard being had to existing accommodation, and to the enormous outlay already incurred by the various companies on their terminal stations, to attempt now the construction of such a terminal station as might be designed if the ground were virgin, and if the accommodation of the passengers were the one main object to be considered? Or will it be wiser to attempt such a systematic linking together of the actual stations as may to some extent have the same object?

Mr. C. Waring, one of the promoters of a scheme for bringing the railways terminating at Euston-square, Waterloo, and Paddington, to Charing Cross, and lodging them in a spacious station to be erected in Northumberland-avenue, gives some striking figures, taken from the Census, to illustrate the inconveniences attending the position of the Euston Station. He speaks of it as "selected by Mr. Stephenson forty years ago as a fit terminus for the then 300 miles of railway in the London of that day, comprising two millions of people." This is not quite exact, and neither does justice to Mr. Stephenson, nor makes out the best case for the central station. It was in 1834, to the best of our remembrance, that the Bill for the Euston Extension was passed, forty-seven years ago, and the selection was merely that,—and a very masterly one it was,—of the nearest spot to the centre of population to which the existence of garden ground and property not covered with buildings allowed a line to be made without wholesale destruction of house property. We have got beyond that state of things, partly

because the traffic has so increased that the companies can afford to buy their roadway through London itself, partly because the public are so anxious for economy of time, and for saving in cabs and other vehicles to take them to the railway stations, that the objections which, in 1834, were insuperable, are now regarded as trivial.

"Immunity from competition with each other," says Mr. Waring, "is secured to each of these three railways, owing to their proximity, by equal economical and geographical injustice done to the public by all of them." That being to some extent admitted, why are we asked to provide for the union of three of the lines alone, and those three as to which a certain amount of intercommunication already exists outside of London itself, instead of for the solution of the whole problem of the conveyance and exchange of the traffic of all the railways radiating from London?

We are anxious to say nothing hastily upon a very important subject; one, moreover, as to which we have reasons for taking an interest which may be called historic as well as prospective. We have already spoken of Charing Cross as one of the main centres of London, and if land is to be obtained in the vicinity, at any price which it would be prudent for a public company to pay, there might be wisdom in securing it for station purposes. The great thing to bear in mind would be to set down our feet firmly against the farther disfigurement of London by any more of those hideous and enormous roofs, as to the permanent safety of which we are not altogether at ease, and as to the destructive effect of which on the beauty of an urban neighbourhood there can be but one opinion. But what seems to us as in the first place most obvious is the need of a line of railway communication, as we have before now suggested, between Charing Cross and Euston Station. Costly as it would be, we think that such a line would pay, supposing that it was designed and arranged to answer the double purpose of a through railway line, joining the northern and southern railways radiating from London, and of a local urban railway, accommodating an enormous traffic. It is not our intention to indicate the precise course of such a line, but it will be obvious to every one familiar with London that a railway which first substituted a direct and rapid route for the circuitous and perplexed network of streets that now separates Charing Cross from the junction of Oxford-street and Tottenham Court-road, and then followed approximately the line of the latter, and of the Hampstead-road, to the neighbourhood of the Euston Station, would be about the most important stratigraphical improvement that can be suggested in London. Its local traffic, we apprehend, would vie with that of the Metropolitan Railway, and would be more evenly distributed through the day than is the case on that line. For its through traffic we have no precedent, but of its magnitude there can be no question. Further, a line of this kind, while supplying a great want, as much felt by the provinces as by the metropolis, would be safe from any fear of practical competition. The completion of the junction between the Mansion House and Aldgate would in no way interfere with the traffic of this route. To the West, nothing is likely for a long time to be projected within the loop of the Metropolitan and Metropolitan District Railways. Supposing a direct and convenient service to be established over the various lines from the Chatham and Dover Line, south of Blackfriars, to King's Cross, it would not serve the purpose of the traffic of the line we have indicated. It therefore seems to us, while perfectly willing to hear and to consider all that can be urged in behalf of any particular scheme, that the linking of Charing Cross with Euston Square by railway is the first and most feasible object now practicable, and that the question of a central station must be rather secondary than prior to that of the best articulation of the existing London termini.

And yet, notwithstanding the urgent need for such a line on the one hand, and the abundance of capital waiting for safe and lucrative employment on the other, there is one consideration which imperatively prohibits any immediate action in the case as premature. At this present time of writing, no one would be prepared to bring forward a scheme for a railway from Charing-cross to Euston, excepting underground. Independently of the great objection entertained to multiplying tunnels for passenger routes, the cost thus incurred is enormous, chiefly in consequence of the interference with the sewers and whole arrangements of underground London by such a line. The cost could not be estimated at less than from 350,000*l.* to 400,000*l.* a mile, and perhaps much more. A high-level railway, on the other hand, while much cheaper to construct, and more acceptable to the passengers, is justly regarded as inadmissible from the noise of the locomotive traffic. But if, as intimated by us in recent articles, the electric method of propulsion be established, the main objection falls to the ground. An electric high-level line,—we put the matter as yet only as a possibility,—might afford a mode of articulating the London termini, with which no other could compete. And therefore, before subscribing to any new London extension of the railway system, we advise our friends and readers to wait for the thorough establishment, or the reverse, of the claims of the electric railway. We think it far from impossible that a judicious application of this invention to the existing railway features of London may lead to as full and as adequate accommodation being given to the railway public as would have been the case if the central station or stations to which we have referred had been erected forty years ago.

THE "FURNITURE TRADES" EXHIBITION.

The Agricultural Hall is at present occupied by an exhibition of furniture, contributed by the furniture trade, and stated to be "the first annual one," so that we may regard this as the first experiment in a series of contemplated exhibitions of the same type. Exhibitions of what is called art-furniture are common enough now; but there is some interest in looking over a collection not especially or ostensibly got up as an art exhibition, and noticing what degree of artistic taste and workmanship is realised as the spontaneous effort of a number of firms. There is much more which can be praised in this respect than we were prepared to find. There are a good many things that would not be admitted, certainly, into an exhibition of artistic furniture, but there are also a good many which would do credit to any exhibition, as far as good taste and good workmanship are concerned. Indeed, in looking over the spirited introduction to the catalogue, written by Mr. Benn (editor of the *Cabinetmaker and Art Furnisher*) we are disposed to say with the artistic ladies in "Patience," when they come in and find the officers practising æsthetic attitudes, "The sacred fire has descended on them, and they are of the inner brethren." This, after all, would not be quite fair on Mr. Benn, as, in fact, he seems to have much more common sense than to indulge in æsthetic rhodomontade, and his remarks are much more to the point than some of the prolusions of the professed art-critics of the day on similar subjects.

Considering this as a collection of work supplied by the furnishing trade in their ordinary practice, and not specially designed to suit the taste of architects or of exacting customers, there is a good deal in it to show how much the principles and practice of pure taste in furniture design have affected the general spirit and practice of the trade in many cases. If we were to take the stand of articles exhibited by Messrs. Jackson & Graham as a typical example, this progress in taste might, indeed, be considered most remarkable; there is really nothing among the articles exhibited which the most fastidious taste could call in question,—nothing which is not in this respect almost as good as it can be as far as it goes. This firm, however, occupy rather an exceptional position, dealing with a very cultivated class of customers, and having the regular and acknowledged assistance of some well-known and practised designers among architects and decorative artists. But in the works of other firms of less eminence we notice a most gratifying excellence in the articles exhibited, not so much in the attainment of high-class artistic work, for there is not much that could be so described, as in the generally correct perception as to the treatment of objects and materials which prevails in the work of some of the exhibitors. In others, again, we are certainly conscious of some of the indigenous English lack of artistic perception in form or colour. The first stand, for example, exhibits Messrs. Trelar's mats, some of which are seen in process of manufacture. They are excellent things of their class, as every one knows; but in those in which variety of colour and some slight ornamental treatment are adopted, we cannot but be struck with the raw and disagreeable tones of the colouring, and the uninteresting character of the design; yet these are from a firm which largely deals in importing Eastern rugs and druggets. Surely their own imports ought to teach them more in regard to form and colour in work of this class. We notice the same common-place character and disagreeable tone in some of the linoleum productions, of which there are exhibits by two firms; there is occasionally a good diaper among a number of poor ones. The Saxon Wood Industrial Company, again, show a number of chairs of no very particular merit or character in design, and padded with upholstery in fearfully raw colours.

Among the best class of furniture, the tendency is to simplicity of line, and in many cases to simplicity of material. The old English rush-bottomed chair has become quite sought for now, and several firms show specimens of it in a perfectly plain form, but with excellent finish and workmanship; among the best are those by Mr. Walter Skull and Messrs. Benjamin North & Sons, the latter of West Wycombe. A good many of the exhibits, we may observe, are from country firms, and among the London firms the majority seem to be those from the City and east-central, not from the western districts. Among other furniture, that exhibited by Messrs. Lucraft & Son is of excellent quality, both in regard to workmanship and good taste; we refer chiefly to that portion of it which does not affect special imitation of Japanese work, &c.; this latter class of work, which seems to be a speciality of this firm, is well done, but we put this merely imitative work on quite a lower level than the production of simple and serviceable furniture which is not a marked mimicry of any style. Of the professed imitations of Sheraton and Chippendale, some of the best specimens are those of Mr. Julius Jansen; they have the merit not only of elegant finish in the ornamental details, but of more appearance of strength and solidity than is sometimes found in work of this style. Messrs. C. & R. Light show very good work of the same class. Ebony or ebonised cabinets are, of course, legion, and are really so like each other that none can claim any special merit over others; the general average of taste displayed in them is good, but some of the exhibitors are far too much enamoured of looking-glass effects, and cover the surfaces of their cabinets with a multiplicity of mirrors, in such a way as to destroy all repose of effect, and give a vulgar and gew-gaw appearance to what otherwise would be good furniture. Mirrors, when regarded as ornamental effect, should be very sparingly used; just one small one in the central portion of the design, perhaps, but nothing more. Other furniture that deserves high praise for good style and workmanship is that by Mr. Loder, of Cheltenham; Mr. Wright, of Chichester; and Messrs. Wallace & Co. Mr. Turpin, of Bayswater, shows some very good carved chimney pieces, with a portfolio of photographs of similar work done by the same firm, evincing a very high average of taste and neat execution. Mr. Bassant's collection of parquetry is very creditable, and some of it very good in design, but there is too much of interlacing work and apparent relief, which is out of place in work which ought to appear, as it really is, completely flat and destitute of any appearance of superimposed planes. The collection of Mr. J. A. Deintje, which is stated to be all taken from stock work, and not manufactured for exhibition, is most creditable when regarded in that light, but there is a great deal too much looking-glass put on it.

Among one or two specialities may be mentioned the combinations of Canadian bass-wood and walnut, and of cedar-wood and bass-wood, exhibited by Messrs. Thomas Fox & Co. These make costly furniture, but they are very pleasing in effect. The bass-wood, of a peculiar and almost greenish tint, is used for the principal mouldings round panels, and in other situations; the effect is very pleasing, and the workmanship excellent. The cedar and bass-wood dressing-table is a beautiful piece of furniture,—quite an *objet de luxe*,—though the ornament is very simple, and sparingly used. The manufacture of such goods in this material must, however, be restricted, from the difficulty of getting sound and complete pieces of cedar-wood of sufficient size. Among a few articles exhibited by Mr. W. H. Lascelles, a couple of concrete chimney-pieces are worth notice, in a fine concrete, allowing of a certain amount of surface-ornament.

he white one looks rather raw and coarse, but he "green concrete" is an excellent material for ottage chimney-pieces. One or two exhibitors how stands of Gothic furniture, not quite of he best type, but very fair; still one cannot elp feeling that this is heavy and unsuitable ork for furniture, in comparison with the rniture derived from Queen Anne and Georgian types. These types supply, in fact, hat is essentially a furniture style, the excellence of which, in that light, we have never uestioned; the mistake is in applying this rniture style to stone and brick architecture, or which it is quite wanting in dignity of effect nd force of detail. The "Austrian bent-wood rniture," of which there is a very large collection, is, no doubt, capital workmanship in its way, ut, artistically, most disagreeable,—nothing ut weak-looking, sinuous curves, with no points f construction or design emphasised in any ay. It would be easy to give to this class of rniture a more artistic appearance with little xtra expense, and without interfering, in any ay, with its peculiar constructive character, if hose who produce it knew how to do it, or ould get any one to show them. As it is, it may lmost be called "anti-art" furniture; no one vith a cultivated eye for style would care to rnish his room with it, though it is perfectly onest workmanship.

Among constructive specialities are one or wo ingenious combinations the usefulness of which, however, is perhaps hardly equal to their ngenuity. Messrs. Daw-Kerrell & Co., for nstance, exhibit a patent combination couch nd bed: an article which when closed appears s a couch suitable for a sitting-room or bedoom, but the top of which is hinged to turn ver, when it becomes a bed of twice the width of the couch. This might be useful when t is necessary in case of sudden illness to xtemporise a bed, but we do not imagine many people would provide themselves against hat contingency. There is a combination lining-table and billiard-table, "convertible in wo minutes," by Mr. Edwards, of the Kingsland Billiard Works, the top of the dining-table liding off and showing a billiard-table under; ut then, in consideration of the necessary estriction in width for a dining-table, the billiard-table when uncovered is of very limited ize. Messrs. Gudgeon & Sons, of Winchester, xhibit a patent sliding wooden mantelpiece, of very ingenious construction, the object of which s that, when moving from a house, the mantelpiece can be taken away, and, by sliding, raised or reduced in height and width to fit the new fireplace. Whether the closely-fitted pieces are likely to slide very readily, however, after being some years in one position and exposed to the changes of temperature incidental to their proximity to the fireplace, may bequestioned. All these contrivances seem more calculated to display the ingenuity of their inventors than to serve much practical purpose.

The stand of Messrs. Hodkinson & Clarke, of Canada Works, Birmingham, shows an unusual collection of things both useful and more or less artistic. Some of their domestic stained glass is remarkably good in appearance and artistic quality for the prices quoted. They have some specialities in sliding or wind-up window shutters and blinds, which combine practical convenience with good appearance and some susceptibility of decorative treatment, especially in the case of their "Early English Shutter," which is capable of being made very pretty by surface touching or gilding, at comparatively little expense, and in a manner naturally suggested by its construction. The "Linerusta-Walton" material for wall covering is admirably illustrated, and so is the less known "Papyrotile decoration," a kind of leather wallile, another application of which may be seen in the Sanitary Exhibition at Kensington. In both these exhibits there is much really pretty and artistic work displayed; but in both the mistake is made of producing imitations of other materials, wood panelling, &c. The large collection of brasswork, by Mr. W. Close, shows how much progress has been made in the way of tasteful treatment of this material, even in the average stock of a manufacturer. There is nothing of a very high character in design, but at least the old brass monstrosities seem happily to have entirely disappeared.

One thing we must say in praise of the Furniture Trades Exhibition, that its managers know how to arrange and catalogue an exhibition. Nothing could be better in this respect. All the stands are arranged and numbered in regular order, with large placarded numbers that can be read nearly across the room; the corresponding numbers appear in large black numerals against the description of each stand in the catalogue. Anything seen in the room can be at once found in the catalogue, and *vice versâ*; and the catalogue is arranged in double columns on each page, one column giving the descriptions, the other column left blank for "visitor's notes." We could wish all concerned in arranging exhibitions would take the same trouble to ensure convenient and intelligible arrangement.

COLLEGE AND CORPORATION PLATE.

The last addition to the collection of South Kensington Handbooks* forms a very interesting and well-illustrated little treatise on one of the most fascinating branches of silversmiths' work. The objects described are among the finest works of their class, having been in almost every instance originally gifts or bequests from personages of importance to institutions of importance, and the givers have taken care that their donations should be worthy of the donors and receivers alike. There is a certain additional interest imparted to the subject from the historic associations connected with these beautiful pieces of artistic workmanship, which have been preserved from generation to generation as among the treasures of learned colleges and ecclesiastical institutions, and produced no doubt for the admiration of honoured guests on many an occasion of pious or festive ceremonial. Nearly all the examples figured are also, either certainly or on the most probable presumption, of English workmanship, and may in that light be regarded with a certain patriotic satisfaction, coupled perhaps with a melancholy reflection that so little work at all equal to them, in design at least, is produced in England now.

The articles illustrated are mostly drinking-cups, but include also spoons, salt-cellars, or "salts" (as it seems the fashion to call them in South Kensington vocabulary), and other articles of table use, as well as church plate. The subject is treated chronologically, the earliest articles of importance dating from the fourteenth century, the most curious and characteristic of these being the wassail-horn at Queen's College, Oxford, with two bird's claws as feet for it to stand on; a very good example of the fanciful introduction of animal features in ornamental work, in a suitable and semi-natural manner. The one defect is that the feet are not well joined to the body of the horn, or rather to the silver rings which encircle it. Another Oxford College, All Souls, furnishes the earliest specimen of the peculiar wooden drinking-bowl, known as a "mazer," which word Mr. Cripps derives from the Flemish *maeser*, which signifies a knot of the maple tree, out of which this class of bowl seems to have been originally made. These bowls are, of course, silver mounted, the mounting alone (generally round the rim and upper portion) bringing them within the scope of the present subject.

It is interesting to compare the method of applying and distributing ornament in the various periods of design through which the illustrations take us. These range from the fourteenth to the eighteenth century; and it may be observed that the periods which are the greatest in some higher branches of art do not present the best art of this class; and that the style embodying some of the best and richest detail does not always present the best application of ornament to the object. The Perpendicular period, which is certainly not the greatest period of English architecture, presents us, nevertheless, with the most perfect of all models of silver cup design, that of the chalices of the period. Not even in Greek art can there be found any more perfectly logical and suitable application of ornamental design to drinking-utensils than the chalices of this well-known form, so much imitated in modern church plate, present to us. Not only is the ornament pre-eminently suited to the material, but it is all exactly where it ought to be,—the broad-spreading and heavily-moulded base, the large knob on the stem for grasping it by, the fine outline of the bowl, often perfectly plain, always plain towards the rim, where it is to be used,—all these details combine to form an object exactly suited, both practically and in design, for the object for which it was intended. The Leigh cup at Mercers' Hall (about 1500) is an example, on the other hand, of great richness without good application of ornament; the same trellis-work is carried over all the parts, without distinction as to their use or form, and the general impression is that of a very rich and handsome but rather weakly-designed piece of work. The "Century of the Renaissance" presents us with some very fine work, though some of the objects figured in connexion with the chapter so named are by no means Renaissance in feeling; indeed, the illustrations of the before-mentioned chalice forms belong to this century, though the form arose earlier. But the beaker belonging to Christ's College, Cambridge (1597), is essentially Gothic in feeling; the rising tide of the Renaissance did not fully submerge our Gothic shores till some time after it was at its height in Italy. This same beaker is another admirable specimen of the application of ornament,—the salient lines marked by mouldings and running ornament, the surfaces by a totally different and very rich surface ornament, the base spreading and heavy to give stability. The "Poison Cup" at Clare College, Cambridge (so called from the cover containing a crystal which was supposed to grow dull at the presence of poison in the liquid), shows a beautifully rich example of surface ornament, remarkable for its mingling of Gothic and Renaissance character; other parts are pure Renaissance, yet this is earlier (1570) than the Christ's College beaker. The feet are formed, very unhappily, of cherubs' heads, upon whose chins the whole rests. The ewer belonging to the Corporation of Norwich (1597) is complete Renaissance in style, with the elegance and the worst faults of detail of the style, the handle being formed of a female torso bent back, and with a hideous mask on her stomach, after the fashion so common in Italian design and (later) in the work of the "little masters" of Germany; the cup is called English, but it must have been designed by some one under exceptionally strong Italian influence. "The Century of the Stuarts" shows some very elegant and sensibly designed specimens, and also some in which the decoration is very false in taste and very badly applied. The objects which illustrate the earlier part of the eighteenth century occupy a peculiar place in the artistic grouping of the subject. They are totally without the higher order of fancy or invention, or the merit of rich and sumptuous effect; their *motifs* are tame and commonplace, and yet they recommend themselves by a great degree of correctness of taste and purity of line. The candelabrum belonging to the Haberdashers' Hall is a good example of this; it is what one might call coldly designed,—there is no evidence of artistic enthusiasm about it, but it has the great merit of being quite unpretending, convenient in shape, and admirably suited to its purpose.

This kind of comparative criticism as to the application of ornament to utensils seems one of the suggestions which the illustrations of this little book especially afford. Those who take it up for themselves, and go through the whole of the examples, may carry out further some of the reflections we have suggested.

We may add one comment in regard to Mr. Cripps's indignant reflections on the bigotry of the times (1566), when "one parish records that the pyx was defaced and given away for a child to play with. . . . . the vicar had made a swine's trough of the holy-water vat, and that the sacring-bell was used to hang about a calf's neck," &c. Those archæologists who make indignant reflections on such doings quite forget that this degradation of the vessels was a practical protest against a superstition then only just extinct. To us the articles which have thus been lost or defaced would have been of high interest as art, and we may well regret their loss. But to enthusiasts of the Reformation period it may very well have seemed that the holy-water vat was better used as a pig's trough than in assisting to keep up a foolish superstition. We have no doubt the brazen serpent was a most interesting piece of antique work, and that Hezekiah, who "brake it in pieces," because his subjects burned incense to it, would have incurred the wrath and reproaches of archæologists and archæological societies, if there had been any in Judæa in his time.

* College and Corporation Plate: a Handbook to the Reproductions of Silver Plate in the South Kensington Museum, from celebrated English Collections. By Wilfred Joseph Cripps, M.A., F.S.A. Chapman & Hall. 1881.

The Trade Unions Congress.—About 200 delegates are expected to attend the congress, which will commence on Sept. 12, in London.

THE WORKING MAN'S APPEAL FOR FAIR TRADE.

It would be manifestly unjust to a very large proportion of our readers to pass by in silence such a public appeal as has recently been made by, and to, the working man on the subject of "Fair Trade." For the first time in our remembrance we now see a subject brought forward, not by politicians or by agitators, but on the ground of the strong feeling of alarm which appears spontaneously to have arisen among the great mass of operatives. When we find the representatives of the allied trades of the West of England; of the trades associations of the West of Scotland; of the town trades and shipping trades councils of Glasgow and of Liverpool; of the trades associations of Hull and Birkenhead; of the brassworkers, the sugar operatives, the coopers and case-makers, the shipwrights, the dock-yard labourers, the watermen and lightermen of the Thames, and the British seamen, among the signataries of a public appeal made on economic grounds, it is evident that it would be worse than folly either to ignore such a symptom of the times, or to affect to treat it with disrespect.

It is not our object on the present occasion to attempt to express any judicial opinion on the subject thus imperatively brought before us. But we think that it may be of very great service to a large body of earnest men, if we ask their attention for a while, first to certain points on which there is no real difference of opinion, as matter, at all events, of theory; and, secondly, to certain considerations, tending to clear the mind from fog, which have up to this time been remarkably neglected by most writers on the subject of trade.

In the first place, it is now generally admitted as matter of principle and of theory, that a wholly unchecked freedom of trade would be the condition tending to produce the greatest amount of general prosperity among all the nations of the earth, as well as to produce a general level of prices throughout the world, and an equality in the wealth and the well-being of different states and nations. That is a point not now called in question.

The points which now come under practical debate, are,—first, "How is the establishment of such a state of things to be most wisely and efficiently promoted by Great Britain?" and, secondly, "What is the effect upon our own industries, either in mass or in detail, of the steps taken from time to time to ensure that result?" It is clear that it is now beside the mark to revert to those general statements concerning the advantages of Free Trade which, forty years ago, were in fierce dispute. There is little or no contention on these points now. The matters at present in debate are on points of detail, and of detail as to which the experience of the last ten years has mainly to be taken into account and to be explained.

It may prevent much waste of time if attention is directed to the fact that the ordinary division made by writers on political economy of a nation into "consumers" and "producers," although correct and useful enough as an analytical expression in a certain stage of the argument, is not one that recommends itself to men of business. It is not a true division,—and that not only because all producers are also consumers, so that a whole is balanced against a part, but also for a more practical reason.

If a man of business be asked where lies the secret of success and of the art of making a fortune, he will reply, or, at all events, he will agree to the reply, that the chief requisite is to be a good salesman. The art of selling is the art of growing rich. It is organised amongst us to a great extent, but the chief misfortune of the organisation is its competitive, rather than its co-operative, nature. The vast machinery of advertisement is a part of the organisation of sale; and so powerful is this machinery that the cases are few indeed in which an inferior or even a bad article, extensively advertised, does not drive a good but unadvertised article out of the market. The proverb that "Good wine needs no bush" is now unfortunately out of date. Not only will nine persons out of ten judge of the wine by the bush, but the whole ten will require some sort of advice as to where the wine is to be found When population becomes as dense as is that of Europe, an index is the first requisite to make anything known; and a good salesman is the first and most necessary agent to obtain or to keep a market.

Now in all our discussions as to tariff and trade, the salesman has been left entirely out of sight. The principle adopted has been that of the old proverb that we have quoted. Of course, there are the private and competitive efforts made by different manufacturers to sell. There is, as above remarked, the ever-extending advertisement system. But, for a recognition of the master fact that when nations are in any way interfering with private traders, a nation, in order to become or to keep rich, must organise a great selling power, we find not a hint given by the doctors of political economy.

For this, forty years ago, there was a good practical excuse. England then had a sort of monopoly of production. Thanks to Watt, to Stephenson, to Arkwright, and to others, we had such a start in the great race of production that customers were ready for all that we could produce. And for nothing were customers so ready to pay as for our machines. Foreign countries courted our engineers, borrowed freely our money, bought all that we could supply them with better and cheaper than they could produce it themselves; and, above all, bought our textile machinery, our engineering machinery, and our primary appliances for the aid of industry.

And thus, year after year, a wider and lower level was attained. Each year other countries became more able to do for themselves what we had taught them to do. As they did so, so they built up tariffs to encourage their own home productions, and to keep out ours. According to theory, they were wrong in so doing; but, in point of fact, so they did. According to theory, they impoverished themselves by the unnecessary prices which they paid for much that they could have got cheaper from us. According to fact,—look at the account recently given in these pages of the growth of New York!

In the discussion which is already ringing in men's ears wherever they most do congregate, it will be well, therefore, to consider what steps have been taken, or what steps may be taken, to secure for the industry of the nation, as a whole, that market which every trader strives to secure for himself, generally at the cost, to some degree, of his rival.

To this it may be said, the nation, as a whole, can and should do nothing to ensure a sale. It is the accumulation of the individual efforts of the private traders that will attain this vital end.

This might be perfectly true if we had fair play all round. But other nations do not think so; other nations take national steps to secure markets for themselves at our cost, to keep us out by bounty or by duty. It is plain that private effort cannot contend successfully against national effort. If it could, the latter would cease to be made. Forty years ago, something very different was expected. We have hinted at one main cause which has entirely altered the face of the markets of the world. The least that wise men can now do is to endeavour to understand the case by ascertaining the actual facts. Those are frightfully behind the day who would apply to actual circumstances the sanguine (and, as it turned out, wholly incorrect) anticipations made at a time when we were to a great extent the only steam power and machine manufacturers in the world.

If it be thought that this consideration has weight rather on one side than on the other, we cannot help that. It is not because it leads to an agreeable or to a disagreeable conclusion that a method is good. Whatever may be the outcome of the investigations, we feel certain that a thorough inquiry into the neglected subject of the selling power and machinery of the nation must precede any wise and exhaustive reply, in any sense, to such an appeal as that signed by Mr. Armit.

Another point, the discussion of which may perhaps tend to modify preconceived opinions, has also to be borne in mind. The year 1872 was in many respects that of our greatest commercial prosperity. In 1872 the exports of Bradford were of the value of 8,659,636*l.* In 1880 they had sunk to 1,010,514*l.* Now it is, of course, of vital importance for the men of Bradford to ascertain the causes of this decline in the selling power. But in so doing, it will be necessary to glance also at the history of the preceding thirty years, and to see what causes have been in continued action between 1840 and 1880. We may attribute the decline since 1872 to a wrong cause, unless we are sure that the cause to which we attribute it was not equally in operation before and after 1872.

In 1842 our exports were, in round numbers 50,000,000*l.* In 1880 they were valued at 222,810,520*l.*,—a little more than quadrupled. But our imports had risen in the same year to 409,990,056*l.* Whence comes the balance of 187,179,530*l.* that we have purchased more than we have sold? It is possible that this may be to some degree a matter of account. For instance, if imports and exports be both valued at the shipping port, the value of freight is included in one case, and not in the other. A part of our profit would thus escape notice. But, however it may be, one of the first steps towards a thorough thrashing out of the subject must be to show how the 409,990,056*l.* of imports are paid for. No one sends imports as presents. In one way or another, sooner or later, they must be paid for either in kind or in cash. When the men of Bradford see trade leaving their town as above stated, they would not be the men they are if they were contented with being told that "they must have their downs as well as their ups." The wise and prosperous tradesman is he who has many, if small, ups, and no downs. It is a matter of hope and encouragement to see the working men of England endeavouring to ascertain for themselves the true causes of these very startling and menacing "downs."

ST. MARGARET'S, WESTMINSTER.

The thoughts of many have been recently directed to Westminster Abbey, and the occasion is taken advantage of to revive the often-made suggestion to remove bodily its too near neighbour,—the old parish church of St. Margaret.

An eminently social contemporary, which by its bright writing and varied information not alone amuses but instructs on many subjects, has very recently informed the public that serious steps have already been taken in this direction. The Duke of Westminster has, it would appear, offered to give rent-free a piece of land in Victoria-street, next the National Savings Bank, on which to re-erect the old church. We have never been amongst those who called for its removal, and cannot join them now.

Built originally as a chapel-of-ease for the monks of the neighbouring abbey, St. Margaret's would appear to have been from a very early period "in danger of down-pulling," to quote the words of Stow, writing now hard upon 300 years ago. But the threat that has hung over the church seems constantly to have been averted. Indeed, it is since Stow's time that have gathered round and in St. Margaret's most of the historical associations that would fight against its removal. The claims of a building which contains not alone the ashes of William Caxton,*—reposing, with a fitness rarely to be met with, under the shadow of the abbey where the most active portion of his busy life was spent,—but the remains of the unfortunate Sir Walter Raleigh, beheaded in the Palace-yard close by, and almost by his side those of the sister of Lord Howard of Effingham, of far-famed Armada memory; of the learned and libellous poet John Skelton, Wolsey's enemy; where rest the earthly remains of the mother of Cromwell and of Katharine Woodcocke, the second wife of Milton; and last, not least, of that most patient and unfortunate of engravers, Wenceslaus Hollar,—to whom we owe a debt of gratitude as the most faithful of the delineators of old London and its monuments,—are not slight. It was in St. Margaret's that garrulous Samuel Pepys was married,—in what a "mighty fine" costume we can imagine,—to the lady of whom he speaks in his Diary so ungallantly; it was at the same altar-steps that pliant and witty Waller was married, so Peter Cunningham tells us, though to which of his wives he does not say. Milton, too, was married here to his second wife, who lies buried in the church; and Lord Chancellor Clarendon, whose wife was the grandmother of two English queens, Mary and Anne. Barbara Villiers, the beautiful Duchess of Cleveland, and Betterton, the actor, are among those baptised in St. Margaret's. As the church has been at all times attended, as it still is supposed to be attended, by the members of Parliament during the sittings of the House, another interest is added to St. Margaret's.†

* A simple tablet erected many years ago by the Roxburghe Club records this fact.

† In the "Antiquities of Westminster," by J. Smith, of antiquarian and artistic fame, among its numerous and valuable illustrations is a reproduction of the title-page of the Warner edition of the Book of Common Prayer, in which is given an interior view of St. Margaret's, with the old pulpit and the Speaker's pew.

St. Margaret's has long shown with pride its famous painted glass window, whose story is a very odyssey of woes and escapes. Sent originally from the quaint old Dutch town of Dort for Henry VII. for the chapel in Westminster Abbey which bears his name, it never reached its destination. Prevented in the first place by the death of the king, it was given to the abbot of Waltham. After escaping the dangers consequent on the dissolution of the monasteries, it found a resting-place in the chapel at New Hall in Wiltshire, and afterwards at Epping; and the window finally reached St. Margaret's (1758), within a few yards of the building for which it was originally destined. Here it has remained,—well protected exteriorly by a plate-glass window,—ranking among the best specimens of the glass-painter's art we possess in England. The church contains not a few other interesting artistic features which cannot fail to strike the appreciative eye; the altar-piece, a wood-carving which the sexton, at any rate, is certain is the work of Grinling Gibbons; the stalls admirably restored; the few pieces of old woodwork left, patching the lighter and more modern addition; a number of curious monuments on the walls; and some modern painted glass windows not the worst of their kind.

St. Margaret's, it will be seen, is an ancient church, dating indeed originally from the time of Edward the Confessor (eleventh century), by whom it was built near the abbey, solely to relieve the larger building of duties as a parish church. In the reign of Edward I. (thirteenth century) it was rebuilt at the expense of the wealthy merchants of the Staple. It has since been largely repaired more than once, and quite lately.

With such a history as we have here incompletely sketched, the objections to its removal are strong,—too strong, as it seems to us, to be overcome by the slight damage the church is thought to inflict upon the abbey. That it hides part of the latter in certain positions seems to us no great evil,—there is no advantage in seeing everything at once,—and as we have long ago urged, it serves as a scale by which to measure the abbey, and so increases its apparent size and consequence.

STRAWBERRY HILL.

The recollection of the sale of the contents of Strawberry Hill, just nine-and-thirty years ago, can hardly have faded from the minds of our readers; and now the world learns with some little astonishment that the sale is about to be repeated, with this difference, that it is the mansion itself and not merely its contents that is about to be dissociated from the names of Walpole and Waldegrave, with which it has been linked for above 130 years. A few memoranda relating to the early history of a place so full of historic and classical memories can scarcely fail to be of interest to our readers.

Two hundred years ago even the name of Strawberry Hill was unknown; but when George the First and Second were kings, there was a strawberry garden on sloping ground, some 300 yards from the Thames, on the high road between Twickenham and Teddington. In or near this garden, the coachman of Lord Bradford,—the squire of the latter village,—erected out of his savings a small cottage, which he let out as "apartments" to the London friends of Pope and other resident gentry. Colley Cibber, Bishop Talbot (of Durham), Lord Carnarvon, and other persons of title lodged here during the heats of the London season; and two elderly ladies, named Chenevix, would seem to have taken a lease of it, in the hope, doubtless, of making money out of it, having retired from business as the keepers of a toy-shop at the West End. Horace Walpole, a younger son of the great Sir Robert, had turned in early life a virtuoso or antiquary, and wanted a spot which would accommodate his treasures better than a small lodging which he had taken at Windsor, and which he compared to the "tub" of Diogenes. He came, he saw, and was conquered; he purchased the lease of the Misses Chenevix (who, when they called to see him, complained that they were treated with old cabinets instead of with tea), and afterwards became the freeholder. His acreage at first was small: only a cottage, a garden, and a sloping meadow. But it was not difficult then to buy land ten or twelve miles from London; and his two or three acres gradually grew to fourteen, and eventually to forty or fifty. (The house, we may add, is now offered for sale with fifty-one acres of ground, exclusive of Little Strawberry Hill, which comprises nine or ten more.)

Horace Walpole tells us a good deal about this place in his amusing letters. He first settled here in June, 1747. Under that date, he writes:—"You perceive by my date that I am got into a new camp, and have left my tub at Windsor. It is a little plaything house that I got out of Mrs. Chenevix's shop, and is the prettiest 'bauble' you ever saw. It is set in emerald meadows with filigree hedges;

> A small Euphrates through the place is roll'd,
> And little fishes wave their fins of gold.

Two delightful roads, that you would call dusty, supply me continually with coaches and chaises. Barges, as solemn as barons of the Exchequer, move under my window; Richmond-hill and Ham-walks bound my prospect; but, thank God! the Thames is between me and the Duchess of Queensberry. Dowagers as plenty as flounders inhabit all around, and Pope's ghost is just now skimming under my window by a most poetic moonlight. . . . . The Chenevixes had tricked it out for themselves; up two pairs of stairs is what they call Mr. Chenevix's library, furnished with three maps, one shelf, a bust of Sir Isaac Newton, and a lame telescope, without any glasses."

The above is Walpole's own account of the place to his friend, the Hon. H. S. Conway. About the same time he wrote to Sir Horace Mann:—"The house is so small that I can send it you in a letter to look at. The prospect is as delightful as possible, commanding the river, the town, and Richmond Park, and being situated on a hill descends to the Thames through two or three little meadows, where I have some Turkish sheep and two cows, all studied in their colours for becoming [*sic*] the view."

Such was the spot which Horace Walpole resolved to turn by degrees into a sort of enchanted castle, where the rigid and stately rules of architecture should be defied, and a natural simplicity in gardening should be studied, whilst a picturesque and almost monastic antiquity should be apparent in every lineament of the house. Very shortly after he became its owner, he resolved upon enlarging the house and extending its grounds; and it is not a little startling to compare the above prosaic account of it as it was when he took it with his own poetical picture of what it was exactly thirty-one years afterwards. The following are the lines referred to; they are from a note of invitation to Lady Blandford:—

> "Where silver Thame from Twick'nam's emerald meads
> To Teddington his winding current leads;
> Where at an obelisk three highways meet,
> There stands an ancient ivy-mantled seat,—
> Yet still less ancient than its ancient lord
> (If Ra'ter true and Catherine Clive record).
> With storied windows in the mansion right,
> That half enrich and half exclude the light;
> Shields, sabres, spears of Saxons, Goths, and Gauls,
> Trophies of better days adorn the walls;
> With many a portrait saved from time and flames,
> Of sages, warriors, and their beauteous dames."

Walpole became, so to speak, his own architect, in the enlargement and fitting up of his newly-acquired mansion. He resolved that the ornamentation throughout should be of the Gothic style, and in order to carry out his ideas in that respect, made a tour through various parts of the kingdom, during which he collected models from the principal cathedrals in which that species of architecture prevails. It must be owned that the result was a very singular admixture of battlements and crocketed pinnacles, and doorways, windows, and mouldings of all styles, from Norman to Elizabethan, together with a museum of "nick-nacks, rarities, and curiosities."

The house,—which Horace Walpole and his friends from the first familiarly shortened into "Strawberry,"—was still a small "toy," or little more, when Pulteney, Earl of Bath, thus celebrated it in a mock-heroic song:—

> "Some talk of Gunnersbury,
> For Sion some declare,
> And some say that with Chiswick House
> No villa can compare;
> But all the beaux of Middlesex,
> Who know the country well,
> Say that Strawberry Hill, that Strawberry
> Doth bear away the bell."

Mr. J. F. Murray, in his "Environs of London" (1842), sums up the appearance of the house and its surroundings in the following words:—"A place intrinsically more paltry does not exist: dirty, dingy walls, rough casted with mortar and pebbles, and surmounted by wooden battlements, of which the founder himself survived three generations: bounded on two sides by the high road with all its dust, noise, and publicity; the rooms low, dark, and, with the exception of the long gallery, devoid of proportion; the grounds limited to a very small space, and that limitation rendered still more conspicuous from the attempt to crowd into it temples, grottos, and statuary. The only merit of Strawberry Hill is one with which Horace Walpole had nothing to do, namely, the view of the river commanded by this piece of architectural jim-crackery. Walpole seemed altogether to forget, in what he chose to call his restoration of the pure Gothic, that the essential character of that style is grandeur and sublimity; and that, without space and magnitude, all examples of the Gothic must be contemptible."

But it is time for us to hasten on to a description of the house as it must have appeared in its prime just a century ago. Fortunately we have abundant material in Horace Walpole's chatty letters, and his huge volume of the Ædes Walpolianæ. We shall see that it has soon grown out of a cottage into somewhat formidable proportions. He began his "improvements" in 1753, in which and the following year the library and the great parlour were newly built; the "Holbein chamber" was constructed in 1759; and in the two following years the gallery, round tower, great cloister, and cabinet were erected; in 1770 the "great north bed-chamber" was completed, and in the course of the next six years the "Beauclerk * tower" and the "hexagon closet" were added to the structure. In his description of the villa, Walpole himself writes:—"The castle was not entirely built from the ground, but formed at different times by alterations of and additions to the old small house." He calls the place "a fantastic fabric," a "romance in lath and plaster." On the completion of the building an elaborate description of it, together with an inventory of its contents, was drawn up by Walpole. In it he writes:—"Entering by the great north gate, the first object that presents itself is a small oratory inclosed with iron rails; in front an altar, on which stands a saint in bronze; open niches and stone basins for holy water. . . . . On the right hand is a small garden parted off by an open screen taken from the tomb of Roger Niger, bishop of London, in Old St. Paul's. Passing on the left by a small cloister is the entrance to the house, the narrow front of which was designed by Richard Bentley, only son of Dr. Bentley, the learned master of Trinity College, Cambridge. Over the door are the three shields of Walpole, Shorter,† and Robsart."

Pennant, in his "London," mentions among the treasures of this place a specimen of the skill of Cavalini, who was brought hither from Italy by Ware, abbot of Westminster, about the year 1256, to decorate the shrine of Edward the Confessor. It was a shrine from the Church of Santa Maria Maggiore, which he placed in a chapel in his gardens. It was originally erected in 1255, over the bodies of the martyrs Simplicius, Faustus, and Beatrix, by an Italian noble and his wife. It was made of the same materials with the shrine of St. Edward, and adorned with twisted columns of the same fashion, though differing from it in other details.

As seen from the garden, the house appears to be an irregular structure of three floors, with boldly projecting bays, battlemented throughout, with pinnacles at the angles, and a large round tower and spire towards the western end. Of the interior, as left by Walpole, his own description of the "refectory or great parlour" may serve to convey an idea of the whole:—"It is 30 ft. long, 20 ft. wide, and 12 ft. high, hung with paper in imitation of stucco. The chimney-piece was designed by Mr. Bentley; upon it stands a fine Etruscan vase, between two bottles of black and gold porcelain." This chamber is now the Study, and from its windows is obtained a good view of the garden and river. Walpole constructed a large number of rooms for the display of his miscellaneous collection of art-treasures, and many of these have been converted into bedrooms and so forth. What were known as the "state" rooms still remain as such, and others on a far larger scale have been added. The Gallery,—with its ceiling of fan-tracery and its Gothic recesses,—though not the largest in size, is the most remarkable room in the house, and does not appear to have undergone much alteration since Walpole's time, excepting in the

* So named after the beautiful and witty Lady Diana Beauclerk.

† This was the maiden name of Horace Walpole's mother.

decorations. The female portraits in this room, sometimes named "the Waldegrave Beauties," were all painted by Mr. James Sant, R.A. The staircase appears to have been made more commodious than it was originally, and is ornamented with a marble statue, by Noble, of Frances, Countess of Waldegrave.

The chamber which Walpole denominated his "Breakfast-room, one pair of stairs," is now known as "Lady Waldegrave's Morning-room." The remainder of the rooms, as they now appear, are thus described by Mr. James Thorne, with his usual minuteness of detail, in his "Environs of London":—

"The Library is most likely what it was originally. As of old, the books are arranged in presses within the Gothic arches of pierced work, and look as though they might be of Walpole's selection. Above are portraits, some, we believe, the same as hung there in Walpole's day. The ceiling, 'painted by Clermont, from Mr. Walpole's design drawn out by Mr. Bentley,' retains all the shields, symbols, and devices which he has described with so much parental fondness.

The great North Bed-chamber is now a sitting-room, for which, being light, well proportioned, having a cheerful outlook, and handsomely furnished, it is far better adapted than for a bed-chamber. Its chief ornaments are portraits, among which are Walpole's favourite niece, the Duchess of Gloucester, by Reynolds, and his hardly less favourite friend, Lady Di. Beauclerk, by Powell.

The New or West Wing, added by the Countess of Waldegrave about 1860-62, agrees in general style with the rest of the building, but is more solidly constructed, and the rooms are on a larger scale, and loftier. The large dining-room is a noble room, lit by three great windows by day, by sun-burners in the evening. The ceiling here, as in all the new rooms, is of stucco work, corresponding to those of Walpole's designing; and the great chimneypiece is of stone, elaborately carved. Among the portraits on the walls are King James II., and James, second Earl of Waldegrave, by Reynolds, very fine.

The Great Drawing-room is a very large and splendid apartment. Its grand ornament is Reynolds's masterly group of the three Ladies Waldegrave, daughters of James, second Earl, which excited such general admiration at the second Exhibition of National Portraits, 1867. It was painted for Horace Walpole, and Reynolds was long in finishing it. When he got it home, Walpole wrote to Sir Horace Mann that it was 'a charming picture,' but he grumbled somewhat over it to Pinkerton. 'Sir Joshua,' he said, 'gets avaricious in his old age. My picture of the young Ladies Waldegrave is doubtless very fine and graceful, but it cost me 800 guineas.' ('Walpoliana,' p. 159.) Under this picture is a gorgeous Mediæval coffer, carved and gilt, with a long painting in the front panel that contrasts curiously in its minute finish with the breadth and richness of the masterpiece above. On one side of this is Magni's charming marble statue of the Reading Girl, on the other a seated Bacchante with Tambourine. Among the portraits are Maria Walpole, wife of the second Earl of Waldegrave, by Reynolds, a charming picture of a mother and child, exquisite in feeling, colour, and execution; Martha and Theresa Blount,—Gay's

'Fair-hair'd Martha
And Theresa Brown';

Sir Robert Walpole, first Earl of Orford; Horace Walpole and Mrs. Damer; Lady Mary Faulkner, by Liotard; Laura and Charlotte Walpole, daughters of Sir Edward Walpole, by Ramsay.

The end of the billiard-room is occupied by a composition, by Dickinson, of the Gladstone Ministry, with life-sized portrait of Gladstone seated on the right, Lowe and Bright on the left; beyond them the Duke of Argyll, and standing behind him Lord Carlingford, the lord of Strawberry Hill, for whom the picture was painted. The other members of the Cabinet are in their several places, and all, as far as we recognised them, are faithful portraits. In this room are also at present (1876),—for most of them must be taken subject to removal elsewhere,—portraits of Frances, Countess of Waldegrave, by Dubufe; Lord Carlingford, by Tissot; Sir Robert Walpole, Earl of Orford, half-length, standing, with coronet by side; James II. by Kneller; George I., &c.

In an adjoining reception-room are portraits of Henry, first Lord Waldegrave, and of his wife Henrietta Churchill, both by Kneller, and favourable examples of his pencil; James, second lord, and first Earl of Waldegrave, and companion picture of his wife, Mary Webbe. Catherine Shorter, wife of Sir Robert Walpole; Princess Amelia, by Reynolds. On the staircase a full-length of John Braham, in theatrical costume, by Healy; and one of John James, sixth Earl of Waldegrave."

Though it was the interior of his house, and the society which it collected, that Horace Walpole loved the best, yet he took a great pleasure in planting the grounds around his new villa, and would talk in a very learned strain with his nurseryman and his gardener, whom he took largely into his confidence.

So thoroughly did Strawberry Hill, under Walpole's rule, become the head quarters of fashionable society, that it has been remarked, almost as much in earnest as in jest, that "the lesser court of King Horace at Twickenham has proved no contemptible rival to the greater court of King George and his Queen at St. James's."

Here Walpole was honoured with visits from George III. and his Queen, the Prince and Princess of Wales, and all the *élite* of society, and his breakfast and dinner parties became famous. One visitor, who was always welcome here, because of the amount of scandal which she had on hand, and the fearless and witty sallies with which she would retail it, was Audrey, Lady Townshend, a person "notorious in West-end society for her free speech and freer manners." Horace Walpole, however, delighted in her company. "She would come bursting in upon him at Strawberry Hill," writes Mr. Percy Fitzgerald in his "Life of Charles Townshend, Wit and Statesman," "and rush all through the house, exploring, and enlivening her explorations with the drollest commentaries. We can see her struggling up the little stair, all but sweeping away the China monsters, and hear her saying to the owner, 'Lord God, what a house!' . . . We can hear these two gossips sitting down to discuss a piece of authentic scandal. 'But was there proof?' asks Horace, doubtfully, on some wicked anecdote being told. 'Proof, indeed?' replies the lady; 'why, she was proof all over.'" It was she who declared that Strawberry Hill would be a very pleasant place if *that* Mrs. Clive's face did not rise upon it and make it so hot! She lived till eighty-seven, entertaining company at her house at Whitehall, being long separated from her husband, and left her fortune to her grandson, afterwards Lord John Townshend.

Thomas Babington Macaulay was brought to Strawberry as a visitor when quite a child, "dressed in a green jacket, with red collar and cuffs, and a frill at the throat, and white trousers." To his dying day he is said to have carried in his head a catalogue of Horace Walpole's collection.

Walpole's neighbour, Lady Charleville, told him that when she had some company at her house, some of them had come over to see Strawberry Hill. "Pray," asked one of them of another, "and who is that Mr. Walpole who lives at Strawberry?" "Lord!" cried another, "don't you know the great epicure, Mr. Walpole?" "Pooh!" said a third; "a great epicure! you mean the antiquarian." Not a bad example, this, of the truth of the poet's well-known line:—

"Nec vixit malè, qui natus moriensque fefellit."

Among the art-treasures dispersed at the sale which took place here in 1842, and of which mention was made at the opening of this paper, was the celebrated clock (now at Windsor Castle) presented by Henry VIII. to Anne Boleyn, and which came into the hands of Horace Walpole through Lady Elizabeth Germaine. It is described by Horace Walpole as of silver-gilt, richly chased, engraved, and ornamented with fleurs-de-lys, little heads, &c. On the top sits a lion holding the arms of England, which are also repeated on the sides. On the weights are the initial letters of Henry and Anne, with true lovers' knots, and mottoes above and below. This clock was purchased at the Strawberry Hill sale by Queen Victoria.

Here Horace Walpole set up a private printing-press. Here he printed, in 1758, in two duodecimo volumes, his "Catalogue of Royal and Noble Authors." At first, as Lady Hervey tells us, "he did not intend to have any printed except what he himself printed and gave away; but the demand has been," she adds, "so very great, that, to avoid disobliging people, he has at last allowed his own printer to print and publish an edition for his [the printer's] advantage."

"We naturally expect to find at Strawberry Hill," writes the French author of a "Tour in England," in 1825, "a monument of the imposing architecture of the Middle Ages. But the castle, though a model of taste and elegance, may more properly be called a Gothic building in miniature. It is the villa of a wealthy man of the world rather than the manor-house of a feudal baron. . . . . I should prefer more simplicity and less correctness. . . . . The apartments are fitted up and furnished in a style corresponding with the exterior of the building, the ceilings, niches, and other details of the architecture being imitated from the picturesque decorations of cathedrals, abbeys, and other Gothic edifices. Horace Walpole has been reproached for a certain degree of meanness towards artists; but the pictures and treasures of antiquity which adorn Strawberry Hill would be worthy of a royal gallery. . . . Everything was calculated to intoxicate this English Vathek in his elegant palace. Strawberry Hill was visited by artists, who looked upon its owner as their Mæcenas; by titled courtiers, who came to learn from him the tone of good company; and by the brilliant beauties of the day, who were happy to pay with a smile for the honour of figuring in Walpole's amusing chronicles."

Twenty years later, after Strawberry Hill had been dismantled by its then owner, the Earl Waldegrave, who converted its plates and Japanware and nick-nacks, that so fittingly decorated its rooms, into hard cash, the rickety structure began to show signs of decay; the walls cracked, the plaster peeled off in patches, windows had to be boarded up,—every part, in fact, appeared fast dropping into unsightliness,—"a wretched modern lath-and-plaster ruin."

About twenty years ago, when Lady Waldegrave became the owner of the property, the building was rescued from its semi-ruinous condition. It was enlarged by the addition of a new wing, and the interior refitted throughout; so that, as it now stands, Strawberry Hill may be said to be a renewal of Horace Walpole's house, combined with the additions of modern sumptuousness and the requirements of modern habits. Lady Waldegrave was a daughter of the late John Braham, the singer; her mother was a sister of a medical man, Mr. George Bolton, of whom a good story or two is told by the Rev. J. Richardson, in his amusing "Recollections."

It has been the fashion with superficial writers to disparage Horace Walpole as a foolish and selfish *dilettanti*, and one who lived a frivolous and useless life. Doubtless he was neither a great man, nor a statesman, nor a really learned man; except his correspondence, there is but little to admire in his efforts as an author. But some little credit is due to the originator of Strawberry Hill for having paved the way for that taste for Gothic architecture which, two generations later, found its true expression in the designs of the elder Pugin and Sir Gilbert Scott. Further credit also attaches to his name as having been, along with Pope, the author of that revolution in horticultural taste which substituted the picturesque for the stiff style of horticulture which is associated with Dutch canals, Italian gardens and terraces, and the designs of Le Notre and his school. It will be remembered that Addison, in his *Spectator*, threw out some hints on the improval of landscape gardening; and Pope, in a number of the *Guardian*, which is as amusing as a scene in Molière, disenchanted our ancestors of their love for yew-trees metamorphosed into giants, dragons, and other monsters. His humorous catalogue of trees ready cut for sale contributed in some measure to restore to their right place the mutilated branches of natural oaks and elms; and in his epistle to Lord Burlington the poet lays down some sensible and tasteful rules as guides for the new English school of gardeners. It was Pope who put an end to the formal lines of Dutch gardens by his lines of censure on the place in which

"Grove nods to grove, each alley has its brother,
And half the garden just reflects the other."

But, when he wrote thus, he little knew to what an extent his views were destined to be confirmed by the practice of his courtly neighbour at Strawberry Hill.

A Caen Stone Font, with marble columns, has recently been placed in St. George's Church, Newcastle, Staffordshire. It is the work of Messrs. Jones & Willis.

CONTINENTAL GATHERINGS.

Few questions have received more careful consideration of late days than that relating to the dwelling-places in our great cities of the daily-increasing number of our industrial workers. Census after census,—and in every country the same rule is observable,—points to the gradual inpour of the country populations to the great centres, where fit accommodation, in spite of the activity of the building trade, becomes each year more hard to find. It is not now for the first time that reports of the difficulties in this direction met with by the working population of Paris reach us, and yet in the midst of a building activity in the French metropolis that resembles that of the period of the late Empire, the dwelling accommodation of the working classes becomes scantier and scantier, with fatal results to the observation of the laws of hygiene. Not many days since, at a meeting of the French "Académie des Sciences morales et politiques," a pamphlet on this important question was presented to the members. Dr. Marjolin, in this little work, warmly calls, in the name not alone of society and of medical sanitation, but of morality, attention to the unhealthy dwellings of many of the Paris working people. From statistics (of no later date, it is true, than 1866) he shows that in Paris out of 40,000 families, no fewer than 26,000 possessed for their home *but one room*. Half a century since our author recalls that in an admirable work on "The Dangerous Classes in the Population of our great Cities," Fregier had pointed out as a crying necessity the consideration of the dwellings of the unhappy poor; more than thirty years ago, Ad. Blanqui had presented to the French Academy a report on the situation of the working classes, a report in which he had traced a harrowing picture of the state of the homes of the Paris poor; and only recently, in the pages of the *Revue des Deux Mondes*, the same burning question has been ably treated by a competent authority. In the "embellishments" of Paris, for which the Parisians and France at large have had so largely to pay, the supply of cheap dwelling accommodation for the working classes has been overlooked; rents rise yearly as streets and *boulevards* cut through neighbourhoods which formerly supplied ample, even if scarcely suitable, accommodation for those driven now far from the centre. Paris is unlike London, not alone in the fact that it is confined within walls, but that the movement towards our suburbs in every direction which may be said to have been in progress with us for more than a generation is comparatively unknown on the banks of the Seine. That strange anomaly of a part of London called "The City,"—a busy bee-hive by day, a deserted wilderness of unoccupied warehouses and offices by night,—is unknown to the Parisian; and hence, with ever-increasing rents, cheap accommodation becomes a sheer necessity. The disappearance of the small and not over-rented dwellings which formerly existed in sufficient number has created a series of difficulties, and with them a series of dangers, to which, it is ably pointed out by the author of the pamphlet presented to the French Academy, neither the moralist nor the public have the right to close their eyes. After showing clearly the extent and gravity of the evil and the peril, Dr. Marjolin submits his suggestions for a remedy; this, to some extent, he sees in the erection near our great cities of large groups of industrial dwellings, separated from each other; in the multiplication of the means of cheap transport; in an abundant water-supply; and a well-organised system of inspection of the dwellings of the poor. Here, as in everything and everywhere (Dr. Marjolin quotes from Villemain the historian), the work of humanity is a work of politics.

Not long after the completion of Cologne Cathedral, amidst rejoicings which were reported in these pages, the professional world was informed that the restoration and completion of Strasburg Cathedral were to be next proceeded with. We now learn that a similar work is in active operation in the venerated minster of Aix-la-Chapelle, where repose the ashes of its founder, the Emperor Charlemagne. An architectural interest of a more than ordinary nature is attached to this cathedral,—the characteristic conception in the chilly north of the Oriental traditions which Charlemagne had learned in Italy, and more particularly in Ravenna, to admire. For more than two centuries the eastern façade of the cathedral has been widowed of its tower; this is now being restored from the original designs. The subscription-list has been generously filled, the German emperor being foremost among the donors. While the tower is rising, the restoration of the interior of the cathedral is rapidly progressing. The interior of the cupola is, we learn, being decorated by Venetian workmen with works in mosaic designed in harmony with the rest of the edifice. It might be far from encouraging thus to learn that Aix or Aachen Minster was undergoing restoration, were it not that the temple which overshadows the great emperor's tomb possesses too marked a character of its own to be seriously injured, as it is not difficult to feel is the case with Cologne. Indeed, we hear that the citizens of Strasburg have entered a protest against the proposed completion of their spireless minster, so familiar and beloved a feature has it become.

Paris promises to have added to its already picturesquely-broken sky-line a new architectural feature of decided novelty. The Japanese colony have, we learn, determined on the erection of a pagoda, the architect of which will take as his model the pagoda of Yokohama. London, amidst the now heterogeneous collection of its architectural adornments, will soon be outdone by Paris, unless indeed we include Sir William Chambers's quaint conception, the famous pagoda at Kew, intended, we suppose, to give "local colour" to the views he carried out on "Oriental Gardening" acquired during his youthful travels in the East.

The works for the isolation of the Pantheon at Rome,—referred to in these pages some months since,—are steadily progressing, and will, we learn, be shortly completed. In presence of the Italian Minister of Public Instruction, the demolition was commenced of the last block of houses, situated at the corner of the Via Rotonda,—the Pantheon is known to Romans as the Rotonda,—and the Via de la Palombella. Several houses, among them not a few of great beauty, will have also to give way, it appears, at the corner of the Piazza della Minerva. The increase of traffic and population in Rome, and particularly in this now busy neighbourhood, has rendered these somewhat ruthless steps necessary. The grand pile of the Pantheon will soon be seen freed of the paltry additions of later centuries.

THE BRUNSWICK BUILDING EXHIBITION.

Some years ago an exhibition of matters connected with building and architecture took place at Brunswick, which, although on a small scale, was sufficiently a success to encourage its promoters to enlarge the scope of their plans, and repeat the experiment in a more extensive form. The present exhibition is not a local one, though the city and province of Brunswick send 38 per cent. of the exhibits. The entire German Empire has contributed to the collection, and amongst the 473 exhibitors, only three are from another country, these being from Austria.

The official catalogue states that the object of the exhibition is to bring together as completely as possible the raw materials used in building, the tools and machinery employed in their preparation, and architectural manufactures produced by hand or machinery. The scheme of the committee has been comprehensive, and if in admitting furniture stuffs, carpets, &c., it has, perhaps, exceeded the strict limits of its object, yet this is not to be regretted, for, from a practical point of view, such products are so intimately allied with decorative art that the general effect gains materially from their admission.

Like other exhibitions, that of Brunswick has had much to contend with from the fact of many "declarations" having been made at a late period; and thus on the opening day (July 1st) much remained to be done. The efforts of the directors have, however, been fairly successful, and no doubt much of this success can be attributed to the co-operation of the Builders' Association of the city of Brunswick and the Architects' and Engineers' Association of the Duchy. In connexion with the former, we notice that the president, Herr Albert Niess, has been foremost in carrying out the scheme. The site is one which belongs to a large banking company, having previously been used by a carriage factory. It required, therefore, but little alteration. The superficial area is about 22,000 square yards, of which, roughly speaking, one half is occupied by the building itself, and the other by the grounds.

The jury is composed of forty-eight members, one-half being nominated by the exhibitors. The railway companies have given special facilities to visitors, and tramways run to the Exhibition from the city. Postal and telegraphic communication exists in the building, and every provision has been made for the comfort of visitors by opening *restaurants*, &c. A band of music plays every evening in the park, and the Exhibition thus makes a bid for popular favour, as well as for the support of the class which it specially interests. With this view the price of admission every evening is only 3½d., and in the daytime varies from 6d. to 1s., according to the day of the week.

Being only a temporary erection, the architectural features of the main building are in keeping with its purpose. It is designed by Herr Bohnsack in Renaissance style, and he avails himself with success of the opportunity afforded him of displaying his talent for coloured decorations, which, under his guidance, serve to brighten the general effect. Above the entrance is an allegorical picture of Brunonia, extending her arms over the people, the commerce, and the arts of her province.

Proceeding now to examine the various exhibits in the ten groups of subjects, with their sub-divisions, it is immediately evident that the project has met with hearty support from the different branches of the building industry. Our space does not permit us to enter into the comparative merits of the different exhibitors, and consequently in selecting only a few for mention we do so for the sole purpose of giving our readers a general idea of the scope of the Exhibition.

The brick, tile, and earthenware-pipe trades are well represented, the local brick factory company having appropriately erected the entrance to the grounds. The different kinds of stone now in use are also shown, and we notice that the sandstone fountain, exhibited by Schanz, of Langelsheim, has met with commendation. The stove-tiles, and other pottery of Villeroy and of Braun, have been favourably noticed. The show of ordinary roofing-tiles is spoken of as being rather limited, but of slates of different kinds there is a full assortment. In the same category are exhibited asphalte pavements; and mention is made of a trial of the plan for making them less slippery by cutting them up more or less with furrows, and thus securing some hold for horses' feet.

The class of objects used for the interior of a house is comprehensive, and from the fact that it appeals to the consumer, as well as to the professional body, it is evident that exhibitors have had in view some practical results from their participation in the Exhibition. At the entrance the Brunswick Jute Company shows its wares in the shape of curtains in tasteful but cheap styles. With this exception, however, it is remarked that the show of furniture stuffs is insignificant. On the other hand, the Brunswick carpet trade is favourably represented, having the additional advantage of displaying its wares (though not in all cases of local manufacture) in the shape of a furnished room, in the middle of which a fountain is playing. Another interesting object is the cellar lighted by the patent system of Gebrüder Bredehorst, of Bremen, which is said to be an improvement on English systems of subterranean lighting by reflectors, &c. Other varieties of glass, both ground and stained, for windows, are also exhibited.

The division for gas and water apparatus (including sanitary appliances) is not so complete as might be desired. Special notice has been made of a lustre in the recently much-favoured *cuivre poli* (polished copper), exhibited by C. Kramme, of Berlin.

Amongst the exhibits of woods for building purposes is a curious collection shown by Herr Spehr, of Brunswick. The samples are in the shape of books, and are arranged in library form in a wooden pavilion. On the outside the popular and botanical names take the place of a title, while at the opposite extremity the bark is shown. The sides show the grain, and on one side under glass are inserted flowers and seeds of the respective trees.

The grounds are, as may be imagined, wanting in the shelter afforded by trees, but in every other respect their appearence has elicited commendation of the skill employed in laying out the beds and shrubberies. Amongst the most noteworthy objects is the wine-house, built in

the old German style, now much in vogue, and which attracts many visitors, from more than one cause. The iron furniture for summer-houses and other purposes, of Schäfer, the Hanover manufacturer, is well spoken of. A monument erected in the grounds by Horenburger, a local cemetery mason, shows the inclusive nature of the Exhibition. The pulsometer is to be seen at work, and would seem likely to attract the special attention of those members of the building trade interested in draining operations. The Cork stones of Grunzwerg & Hartmann for the prevention of damp walls are also spoken of favourably. The railway engineering industry is represented by the local signal manufacturers, Jüdel & Co., who show a variety of their inventions.

In literary, artistic, and technological exhibits the success of the exhibition can only be considered partial, and some surprise has been expressed that architectural plans have not formed a feature of the project. The two colossal photographs of St. Peter's at Rome are much admired. There are several collections of technical works; and last, though not least, we have to mention the exhibits showing the process of wood-engraving, which, as an ally of the art of architecture, finds appropriately a place in the exhibition. We have simply drawn attention to some of the leading features of this interesting collection. Locally it is considered a success.

EXTRAORDINARY DISCOVERY OF ROYAL REMAINS IN EGYPT.

A discovery is reported from Egypt of a nature so startling that it is necessary to reflect for a time in order to realise its importance. We do not say that it casts into the shade the successful results of the explorations of Layard, of Schliemann, or even of Mariette, because each great step into the past throws fresh light on existing knowledge. But we cannot remember that on any single occasion so full, complete, and promising a find has rewarded the labours of the archæologist.

It is well known that the pyramids, tombs, and sarcophagi identified as the funereal records of many Egyptian monarchs have been only known to us as empty and void. They have been rifled of their contents at a period so remote that no record has been found of the sacrilege, which has generally been attributed to private or indiscriminate pillage. The present discovery goes far to rebut that assumption, to explain the silent void of many a storied tomb, and to open hopes of the recovery, not of a lost chapter of Egyptian history, but of volume after volume of a record of more than 4,000 years. The discovery, of which we can give but a very imperfect account, has led those men of Egyptian science who have visited the scene to the conclusion, that the relics of the sovereigns of three or perhaps four successive dynasties had been removed by the pious care of the Egyptian priests from their appropriate resting-places, and concealed in the secret subterranean gallery now disclosed, in order to preserve them from desecration at some period of conquest or of revolution.

In June last it was observed that the Bedaween, in the province of Keuah, which includes the ancient Theban house, were offering numerous antiquities for sale at very inadequate prices. It was discovered that the source of this hidden treasure was situated in a gorge of the mountain range which skirts the valley of the Nile, at about four miles to the east of Thebes. Herr Emil Brugsch, a younger brother of the well-known Herr Heinrich Brugsch, was sent to investigate the matter by Daoud Pasha, the governor of the province. Near the famous temple of Deir-el-Bahari he discovered a pit, about 35 ft. deep, cut in solid rock, and giving access to a ancient gallery of some 200 ft. long, which was filled with the relics of the kings of the second period of the Egyptian empire,—the new monarchy, comprising the eighteenth, nineteenth, and twentieth dynasties, which endured for a period of 596 years, from 1706 B.C. to 1110 B.C., under twenty-eight kings. Thirty royal mummies have been found, so that it is probable that the entire series of the kings of the new monarchy have been transferred to that sacred and hidden tomb.

If, however, it is correctly stated that the mummy of Pinotem, the third king of the twenty-first dynasty, is among those discovered, it is probable that the kings of this line (that of Thebes and Tanis), are included in the cavern, together with those of the three preceding Theban dynasties. And what is already known of the invasion of Egypt by Naromath or Nimrod, king of Assyria, resulting in the establishment of the twenty-second dynasty, under Shashank or Shishak I., at Bubastis, about B.C. 980, may furnish the key to the concealment of the royal mummies. It has been the fashion to attribute the mutilation of the Sphynx, the Memnon, and many of the most famous statues of Egypt, to Cambyses. Recent discoveries have done much to throw doubt on the probability of this attribution. Cambyses is represented, as we learn from Brugsch ("Egypt under the Pharaohs," vol. ii., p. 290), on a *stele*, in a kneeling posture, as a worshipper of the Apis bull. Darius also is recorded as showing marked honour to the Apis bulls. Thus the idea that it was the Persian dynasty that outraged and mutilated the gods and kings of Egypt has been gravely impeached on the highest authority. But we think that it is now for the first time that a hint has been given to the archæologist that it was the Assyrian invasion from which Egypt suffered such memorable humiliation,—a view which is in full accordance with the ruthless character of the Assyrian kings, as declared in the cuneiform inscriptions. We commend this view, in all its novelty, to the verification of the patient and learned research of the great students of hieroglyphic and of cuneiform records at the British Museum.

For the rest, the remains of Thothmes the Great, identified among the royal mummies, appeal most forcibly to what we may call the historic imagination. Not less imposing is the discovery of the mummy of the Great Queen, Ha-ta-su or Ra-ma-ka, the sister and predecessor of Thothmes III., who has been recently identified ("Handbook to the Bible," p. 31) with the daughter of Pharaoh who rescued Moses from the dangers of the Nile. Four papyri, we rejoice to learn, have been found in the gallery in a perfect state of preservation, and the largest of these was in the coffin of Ma-ka-ra (or Ra-ma-ka, as the hieroglyphic admits of different order in the reading of the syllables). This precious document, 3,400 years old, is about 16 in. wide, and is estimated to be from 100 ft. to 140 ft. long, or double the size of the great Harris papyrus, the most splendid hieratic document hitherto known to exist. It is beautifully adorned with coloured illustrations. We are unfortunately aware that the great bulk of hieroglyphic inscriptions, as well as of hieratic papyri, is occupied with matter of little value to the historian,—the titles of the gods, the ritual of the dead, and the lists of tributes taken in war, or of offerings made by the king. But it is hardly possible that long documents, written in the most splendid period of Egyptian history, and thought worthy of preservation in the very coffins of the greatest monarchs, can fail to contain very much that will prove of the utmost value to the historian.

Not less than 3,700 mortuary statues, and some 2,000 other objects, have been discovered in this wonderful repository. Among these is a leathern tent, bearing the cartouche of King Pinotem, in admirable preservation. It is covered with hieroglyphics most carefully embroidered in red, green, and yellow leather, with the royal vulture and stars on the corners. Fifteen enormous wigs used on state occasions, and nearly 2 ft. high, are among the collection. Each of the mummies is accompanied by an alabaster urn, containing the heart and entrails of the deceased. Herr Brugsch is of opinion that there is another secret gallery leading from the pit. Whether this prove to be the case or no, what has been actually recovered and conveyed to the Museum at Boulaq forms a contribution to the history of Ancient Egypt of a value which it is impossible to anticipate, and probably not easy to exaggerate. Who can fail to feel a deep regret that the life of M. Mariette was not spared long enough to gratify him with a discovery the immediate value of which will in so great a measure be due to his untiring labour?

An esteemed correspondent recently returned from Egypt makes an observation with reference to this remarkable discovery which merits consideration. He says:—"I wish you would draw attention to the fact (which I think is hardly appreciated) that the actual mummies of some of the greatest men in the history of the world are laid on shelves in some rough buildings called the 'Museum of Boulak,' just as if they were varieties of monkeys or interesting minerals! They ought to be treated with the greatest honour, and placed in a grand solid building erected for the purpose. It is a frightful thought that Rameses the Great should lie on a shelf in a shed,—which might be burnt, or destroyed by an inundation! He ought to be honoured as we honour our kings, and as we hope the 'New Zealander' will honour the remains of our great men when he comes across them in ruined Westminster Abbey. I was much interested with the museum,—there is nothing else like it,—but it is not a resting-place for the great."

FRENCH RAILWAYS.

An interesting article appeared some time ago in a foreign contemporary, dealing with the present condition of the French railway system, both as to construction and working. We quote the following particulars as being of interest to our readers.

The most strenuous efforts have been made by the French companies during the last few years to increase the speed of their trains; in short, diminishing that security against accidents which is the primary condition of railway management. Within a few years the journey from Paris to Lyons has been shortened from eleven to nine hours, and this is pointed out as indicative of the progress made since railway directors have been alive to the necessity of improved services. A further increase of speed is looked forward to at no distant date, and in the face of American railways now running in some cases at over sixty miles an hour (and trying to still accelerate their speed), the writer argues that the French lines, being more solidly constructed, present no obstacles to the attainment of the highest rate now usual in the United States, and the consequent reduction of the journey from Paris to Lyons to five hours.

That this rate is already attained on some portions of the Paris to Lyons Railway is inducing the companies to devote their chief attention to the working of the system of signalling, as the locomotives now in use are quite powerful enough to materially surpass their present usual speed. In addition to this point, the question of brakes is under careful consideration.

Almost all locomotives can now travel with steam reversed. This used formerly to be regarded as a measure only to be used in situations of imminent danger, but is now a system in daily use. The Westinghouse and the Smith brake systems seem to be those receiving most attention at present. Some lines have the Achard electric brake.

Amongst other improvements effected or in contemplation are noted the heating of all carriages, the admission of second-class passengers to certain express trains, the introduction of cushions in third-class carriages, and a more perfect system of communication between passengers and guards.

After giving an interesting account of the different systems of signalling in use, reference is made to the plan by means of which the signal disc which means "stop" is in communication with an electric wire which runs between the rails, and this being touched by a metallic brush on the approaching engine, conveys to the mechanism an electric shock, causing the whistle to sound. In some cases this mechanism is connected with the station-master's office.

The details given as to the application of the block system are interesting, and, while admitting that the French are indebted to England for many of the improvements now in use, it is argued that France has surpassed England in the manner of their practical adoption.

More Christmas Cards.—The Suffolk-street Galleries display at this moment not scores, not hundreds, but some thousands of designs for Christmas and New Year Cards, sent in response to the offer of prizes to the amount of 3,500*l.* by Messrs. Hildesheimer & Faulkner. 1,147 frames are hung, each containing from two to four designs. One hundred sets, if not more, are to receive prizes, the highest amount being 200*l.* Mr. Millais, Mr. Marcus Stone, and Mr. Storey, have agreed to act as judges, and the awards will be made known on Monday next. The Exhibition shows the existence of a large amount of skill up to a certain point, and it includes a few very fine drawings; the great want observable is special character.

GRINLING GIBBONS.

In a recent issue of those charming "Echoes" with which, weekly, Mr. George Augustus Sala interests and instructs the town (we offer our personal thanks to him for much pleasure thence derived), the erudite and brilliant writer asks a question concerning Grinling Gibbons, and makes a suggestion to which we are tempted to give further currency. Mr. Sala, referring to the museum of rarities formed by John Tradescant, King Charles I.'s well-known gardener, says he has before him "a queer, thin, mouldy little book, entitled 'Museum Tradescantianum; or, a Collection of Rarities preserved at South Lambeth, near London, by John Tradescant,'" the date of which is 1656. And, after alluding to some of its items, continues thus:—"*Mem.* I also note a cherry-stone holding ten dozen of tortoiseshell combs, *carved by Edward Gibbons*. Was this fashioner of Liliputian tortoiseshell combs the father of the famous artist in carved work, Grinling Gibbons? Horace Walpole was in doubt whether Grinling was of English or of Dutch extraction. Stokes told Vertue, the engraver, that Grinling's father was a Dutchman, but that the artist himself was born in Spur-alley, in the Strand. Reference to the parish books either of St. Clement Danes, St. Mary-le-Strand, St. Paul, Covent-garden, or St. Martin-in-the-Fields, might show whether a Mr. Edward Gibbons lived in Spur-alley at about the middle of the seventeenth century. A nice opportunity for an artistic antiquary, with plenty of leisure. In the Post-office London Directory, I find Spur-street, Leicester-square, and Spur-inn-yard, High-street, Borough, but no Spur-alley, Strand."

We have no doubt ourselves as to the place of Grinling Gibbons's birth, and that Vertue was wrong. From his Nativity, cast by his contemporary, Elias Ashmole, we learn that he was born, not in the Strand, but in Rotterdam, on the 4th of April, 1648. The figure of his Nativity was discovered by Mr. W. H. Black, among the Ashmole MSS., and may be seen, with many others, in the Ashmolean Museum in Oxford. This was first pointed out in our pages nineteen years ago by Peter Cunningham, who contributed a number of curious entries that he had discovered concerning works by Gibbons.* Peter adds:—"That he was of English descent I see reason to believe; for I find in the Works Accounts of the Crown of the time of Charles I. the mention of *Simon Gibbons*, a skilled carpenter, employed under no less a master than Inigo Jones."

There is no reason, for all that, that Mr. Sala's *Edward* Gibbons should not be looked up.

KENT ARCHÆOLOGICAL SOCIETY.

The members of this Society lately visited Canterbury and its environs.

The twenty-fourth annual meeting was held in the Chapel of East Bridge Hospital, the president of the Society, Earl Amherst, occupying the chair.

The Rev. Canon Scott-Robertson, in his capacity of honorary secretary of the Society, read the annual report, which contained the following passages:—

"Since the last annual meeting the thirteenth volume of 'Archæologia Cantiana' has been issued; its entire cost has been defrayed; the sum of 105*l.* has been invested in Consols; and the Society now has standing to its credit at the bankers the sum of 276*l.* 13*s.* 4*d.* The council therefore feel fully justified in preparing to issue another volume of 'Archæologia Cantiana.' Several sheets of the fourteenth volume are already printed, and it is hoped that the whole may be ready for issue about Christmas. It is satisfactory to the Society to know that its volumes are sought for not only by Kentish antiquaries, but by great libraries at home and abroad. The number of new members who have joined the Society since last July is considerably above the average. Sixty-two have already been elected, and eleven await election. Interesting discoveries of foundations containing Roman masonry have been recently made at St. Pancras ruins, in the cemetery of the ancient abbey of St. Augustine, outside the city of Canterbury. O her discoveries have been made near Canterbury and Wingham by Mr. Dowker. At the Roman castrum of Reculver, the demolition of certain wooden outbuildings has exposed to view a portion of the core of the Roman wall, not before seen. Owing to a slight landslip, this masonry needs to be underpinned. The Admiralty had resolved to underpin it and to face it with new brickwork. Your secretary having represented the state of the case to Colonel Pasley, the Director of Works, who is a member of our Society, that gentleman has most kindly ordered that instead of a complete masking wall, nothing more than piers necessary for support shall be placed over the old wall core. At the same time he expressed his pleasure in being able to comply with the wishes of your council."

The report was adopted, on the motion of the Bishop of Dover, seconded by Sir Walter Stirling.

The hon. secretary then briefly described the East Bridge Hospital building, and as the Company passed down, Mr. James Neale described the interesting wall painting recently discovered in the reception-room.

The visitors then proceeded to St. Martin's Church, on St. Martin's Hill, where the Rev. Canon Routledge read an interesting paper on that ancient edifice. The original church, allowed to fall into partial ruin after the Roman evacuation of Britain, was probably restored towards the end of the sixth century to serve as an oratory for Queen Bertha and her attendant, Bishop Leotard, and re-dedicated to St. Martin of Tours, and portions of that building, he believed, were existing even in the present day. It was very likely that the Romano-Saxon building suffered from the fierce and general ravages of the Danes. It still, however, maintained sufficient reputation to have given a title to suffragan bishops for a period of 350 years (according to one tradition), at any rate for fifty years, till they finally became merged, in the time of Lanfranc, into Archdeacons of Canterbury. He assigned the different portions of the church, as it now stands, to Roman, Saxon or pre-Norman, Norman, Early English, fourteenth-century Decorated, beginning of the fifteenth-century, and end of the fifteenth-century periods. He called special attention to the circular buttress on the south side of the nave, which was very peculiar. It was not unlike a circular projection in the Saxon tower of Sompting, in Sussex. The most interesting of all was the font. Assuming it to be Norman, it was almost unique, as being built up of various stones in different tiers. The controversy as to the date of this interesting relic was too long to be entered upon. It was more than probable that the whole font was pre-Norman, chiselled out into the present pattern.

Mr. Loftus Brock said he knew of no font in England,—but there were some in Wales,—built in the same manner as this was.

The party then examined the exterior of the church, and afterwards moved down to the grounds of the Kent and Canterbury Hospital, where the Roman foundations of St. Pancras Chapel, said to have been consecrated by St. Augustine, have recently been excavated through the kindness of the Bishop of Dover and Canon Routledge. The latter gentleman read a paper descriptive of the chapel and remains, and afterwards made a brief statement as to the excavations. At the western porch there were still standing portions of a wall built with Roman tiles and seashore mortar, pronounced by Mr. Parker to be a Roman wall. They had discovered the foundations of a wall and buttresses exactly corresponding on the other side. Below the surface there were parts of a pavement consisting of coloured and patterned tiles. The foundation walls were composed of Roman tiles with here and there salmon-coloured mortar. That there was on this spot some early Roman buildings, whether of a secular or religious character, was indisputable. The Roman tiles were pronounced to be of a good time, and Mr. Roach Smith says "there can be no doubt of the foundations being those of a rather extensive Roman building." The concrete floors at the east end of the nave and in the southern *porticus* were apparently Roman or Saxon. He believed there was originally a small Roman church, which, falling into partial ruin, was restored by Ethelbert, and converted by Augustine to Christian worship. It was afterwards ravaged by the Danes, then restored by the Romans till in its turn it would fall into decay and be superseded by the Early English church, the last window and chancel walls of which still remain. In the time of Henry VIII. and at the destruction of St. Augustine's, some portion of it would be used as an out-house or stable (and last and worst desecration of all) the chancel of a most sacred and interesting building was turned into a pig-stye.

Mr. Loftus Brock said the Society might indeed be congratulated for having made one of the most interesting archæological discoveries which had been made for many a year. There could be no question whatever that the foundations of the walls which had been laid bare were constructed of Roman brick made for the purpose, and never disturbed since they were erected.

The abbey church of St. Augustine was next visited, and afterwards parties were made up and conducted over the cathedral.

The annual dinner took place in the evening in the Music Hall, nearly 300 ladies and gentlemen sitting down to table.

On the second day carriage excursions were made to Ickham, Wingham, Adisham, Bifrons, Patrixbourne, and Bishopsbourne.

* See *Builder*, vol. xx. (1862), p. 797.

SOME REFLECTIONS FOR THE HOLIDAY SEASON.

We are now well into the holiday season, and the passer-by through most respectable quarters of London and the suburbs, and through those pleasant villas which surround the outside of some of the larger provincial towns, constantly gazes on the dismal spectacle of windows full of newspapers and brown paper, there placed by the prudent mistress of the house. At such a time, when the bookstalls are full of holiday numbers of periodicals, and the booksellers are doing a good trade in guide-books, in light travelling literature, and in "novels for the seaside,"—which, so far as our experience goes, are chiefly characterised by being greater trash than the ordinary yellow-backed novel,—it would not be fitting that we should not also become imbued with the holiday spirit, and place in our columns something, too, of the nature of the holiday literature now so popular. It is an undoubted fact that a knowledge of sanitary science, and a greater care in regard to sanitary matters, are becoming general, and even the householder who is inclined still to pooh-pooh sanitary precautions finds so many friends carefully attending to them that perforce he, too, falls in with the strengthening current. But when we come to the holiday season, all the proper precautions vanish rapidly from the mind of our householder, and paterfamilias takes his wife and children to some seaside lodging-house to enjoy the fine fresh breezes of the cliff or the sands during the day, and at night to breathe all kinds of unwholesome air and gases in the anything but a model lodging-house. Seriously speaking, however, it is lamentable to think of the way in which persons now becoming prudent in sanitary matters at home will take up their residence in lodging-houses where the commonest sanitary precautions are neglected. There is no question that many fatal illnesses are contracted in lodging-houses at sea-side and other holiday resorts, and that many cases of ill-health and spoiled pleasures arise solely from the bad sanitary state of the large majority of lodging-houses. We can call to mind plenty of instances of persons who, when you ask them how they enjoyed their month at Seaview Bay, will tell you that it did not agree with the children,—the air seemed to affect their appetite injuriously, and that, indeed, Mrs. A. had something like a touch of low fever after her return. These drawbacks to the holiday are traceable to the sanitary state of the pretty trellised cottage covered with creepers in which the A. family have been residing for a month, and have nothing to do with a relaxing or bracing atmosphere. Thus there can be no question that, often, so far from benefiting by a change of air, families are injuriously affected, because they locate themselves in houses without taking proper care to ascertain their sanitary state before taking up their residence in their temporary abodes. And the absurd,—one might almost say, melancholy,—thing is that those who neglect these precautions are very often persons whose own homes are carefully looked after in regard to sanitary matters. But if visitors will not insist on having lodging-houses properly ventilated, and with wholesome drains, it is not likely that their owners will, as a rule, take the trouble to make alterations, which often cost what is for them a considerable sum of money. The chief remedy, therefore, for this state of things is in the hands of the visitors themselves, who, if they make a point of going only to lodging-houses which are in a proper sanitary state, will, in no very long time, cause a general improvement in the sanitary condition of all respectable lodging-houses.

But there is yet another means by which the health of visitors to seaside resorts may be improved, and which is feasible if it were only vigorously carried out by influential local persons in our watering-places; and that is, to have the lodging-houses carefully inspected by a person with a sound knowledge of sanitary matters, and then to issue a certificate to such houses as are in a proper sanitary state. There

can be no question that if this were done those houses which were certified would command a somewhat higher rent than those which were not certified, so that it would become a positive advantage to a lodging-house keeper to have his house certified as healthy. But unless the examination were real and thorough, it would be worse than useless to give certificates at all; it would, in fact, be an injurious sham. Now, considering how many energetic and prudent persons are to be found among the local magnates of our watering-places, it would be perfectly feasible to set such a scheme in motion if one or two persons would make the first move. And there can be no question that those places which did so would become at once more sought after, because it would at once be said that they were in a good sanitary state, which would be, *ipso facto*, an attraction apart altogether from the surrounding scenery and the pleasant breezes. In most railway stations our eyes now encounter bright-coloured pictures of various seaside resorts,—the Isle of Man, the Devonshire coast, the watering-places of the Channel. What a potent addition to these pictorial charms would be the announcement that "lodging-houses are examined by a sanitary inspector, and certificates of healthfulness are given." What an opportunity is afforded to the Isle of Man to distinguish itself in this way, and to show the potent effects of "home-rule." We say the Isle of Man, because of late its attractions have been very largely exhibited on the walls of our railway stations, and we have very little doubt, judging by most watering-places, that the sanitary state of its lodging-houses, filled by hundreds of visitors, are not so admirable as its fresh breezes and bright seas. But, as we have said, if local persons will not set to work to make lodging-houses perfectly safe and healthy, it behoves educated and prudent visitors to refuse to enter any house which is not in a proper sanitary state.

FROM GERMANY.

New Harbour at Mayence.—The authorities of Mayence have recently approved the plans of Herr Kreyssig for the formation of a harbour capable of accommodating the increased trade of that city, and some preparatory works are said to be now in progress. The projected basin will have quays 2,200 yards in united length, and will be in direct communication with the railway systems which meet at that point. The present Winterhafen has only about one-third of the superficial dimensions of the new harbour. The total cost of the works now in contemplation, and which will be for about four years in course of execution, is 125,000*l.* The completion of the entire scheme will cost 85,000*l.* more, and this latter part of the work will probably be spread over a series of years.

Fires at Theatres.—The recent catastrophe at Nice has attracted attention to the question of the precautions necessary in the construction and internal arrangements of theatres. In Mayence an examination of the Stadt-Theater (which underwent extensive improvements in 1876) has led to the recommendation of farther measures of security, which are to be immediately carried out. For the safety of the staff, fire-proof staircases are to be erected on both sides of the stage communicating with the wardrobes, workrooms, &c., above. The system of lighting will be greatly modified, the electric light being used as much as possible, even where gas is already laid on, and the efficiency of the water supply will also be increased. The cost will be about 1,800*l.*, of which 70*l.* will be spent in providing the stage with separate gas communication.

Improvements at Cologne.—The works for the enlargement of the city of Cologne are being carried on with much energy. The plans of the railway companies are being discussed with some warmth, and if the reports be correct as to their details, the opposition of the citizens would seem well founded. For instance, it is said that the central goods station will be in the best part of the Neustadt, and that the cathedral will have on two sides the new central passenger station and its surroundings.

The War Monument in Elberfeld.—In the year 1875 a competition took place, in which the sculptor Wilhelm Albermann, of Cologne, took the first prize for the design of the above monument, and received the commission to execute it. The central figure of Germania is 13 ft. high. On each side is a figure. One is a cuirassier, sword in hand, and ready for battle; the other is an infantry soldier, his right hand on his breast, holding a flag, and resting on a captured cannon, with a French standard and other emblems. The unveiling took place on the 30th of July.

FROM ABROAD.

Christian Art Exhibition, Bonn.—An exhibition of objects of Christian art will be held at Bonn early in September, consisting of,—(1.) Architecture, represented by designs and models; statuary and carving in stone, wood, metal, or ivory; painting, including oil-paintings, cartoons and sketches, painting on glass, porcelain, or ivory; enamel mosaics; drawings and engravings, &c. (2.) Art Handicrafts, such as bell-founding, organ-building, goldsmiths' and jewelry work, brass work, &c.; ecclesiastical joinery, carpet stuffs, embroidery, church lace, vestments, printing and bookbinding, church vessels, &c. All merely imitative work is to be excluded.

Museum of Modern Art, Paris.—The mode of reconstructing the burnt portion of the Tuileries, and the appropriation of the new building, have been determined on. A proposal, sanctioned by the legislative bodies, opens a "Credit" on the budget of 1881, amounting to 200,000 francs, for the removal of the ruins of the palace. It has been decided to erect between the Pavillons de Flore and de Marsan a museum of modern art, of which the architecture will, as much as possible, accord with the buildings of Philibert Delorme.

International Exhibition, Vienna.—An international exhibition is to be opened in April, 1882, in Kinsterhaus, and it is reported that any contributions from British manufacturers and artists will be highly welcomed by the Austrian Government, as well as by the artists.

INTERNATIONAL RAILWAY EXHIBITION AT BERLIN.

The committee charged with organising this exhibition, announced a short time ago to take place in 1883, intends to make it a thoroughly representative one, including in its scope a correct picture of the historical development of railways in the several countries taking part in the exhibition, together with a display of the working of railways by the different nations exhibiting. The exhibition will contain, besides railway rolling stock, such as locomotives, carriages of all descriptions, cranes and other lifting machinery, materials used in the construction of the permanent way, signalling apparatus with the electric instruments belonging thereto, as well as station and workshop fittings, levelling and testing instruments, and a comprehensive display of technical literature.

INDUSTRIAL DESIGNS.

DIAPERS.

The designs here given are intended for diapers for terra cotta work, and could be used as panels or string courses for either interior or exterior work.

They are not intended for very high relief, for the reason that the dust accumulates in the crevices and becomes very difficult to remove; this difficulty is multiplied vastly when the design is too delicate in detail or deeply cut. In style they are based upon the Egyptian, that style being selected for its adaptability to architectural work. The bottom right-hand corner diaper has perhaps more of the Assyrian feeling than the Egyptian, but is nevertheless sufficiently true to the style of the others to keep them company. No doubt they will suggest to many viewing them in different lights their adaptability of treatment in other materials. When treated in colour they would necessarily lose much of the severity they now possess, and this, in some cases, might be an advantage.

TILES.

We give a design for single or two-colour tiles, representing either 6 in. by 3 in., or 12 in. by 6 in. If in blues, browns, or yellows, they would be effective, and could be used for dados, stoves, edgings for floor tiles, &c. When the perpendicular stripe would not come satisfactorily, then they could be used equally well horizontally or for string-courses, in a single or treble line to divide a plain tiled surface, and thus cheaply relieve the monotony.

An entire decorative treatment in these tiles alone might be made effective; as, for instance, in a dado used perpendicularly in two browns, with border at the top of the leafage tile, used horizontally, therefore 3 in. deep, the body of the wall in plain tiles of a lightish yellow, judiciously broken by courses in a darker self-colour, singly, two, three, or more wide, as the case might suggest.

When the dado was required to be horizontal, then as a finishing border the leafage still could be used perpendicularly, making a good and decided finish, 6 in. deep. It is an advantage in tile work when the design repeats complete in itself, and at the same time forms a design when in conjunction with others.

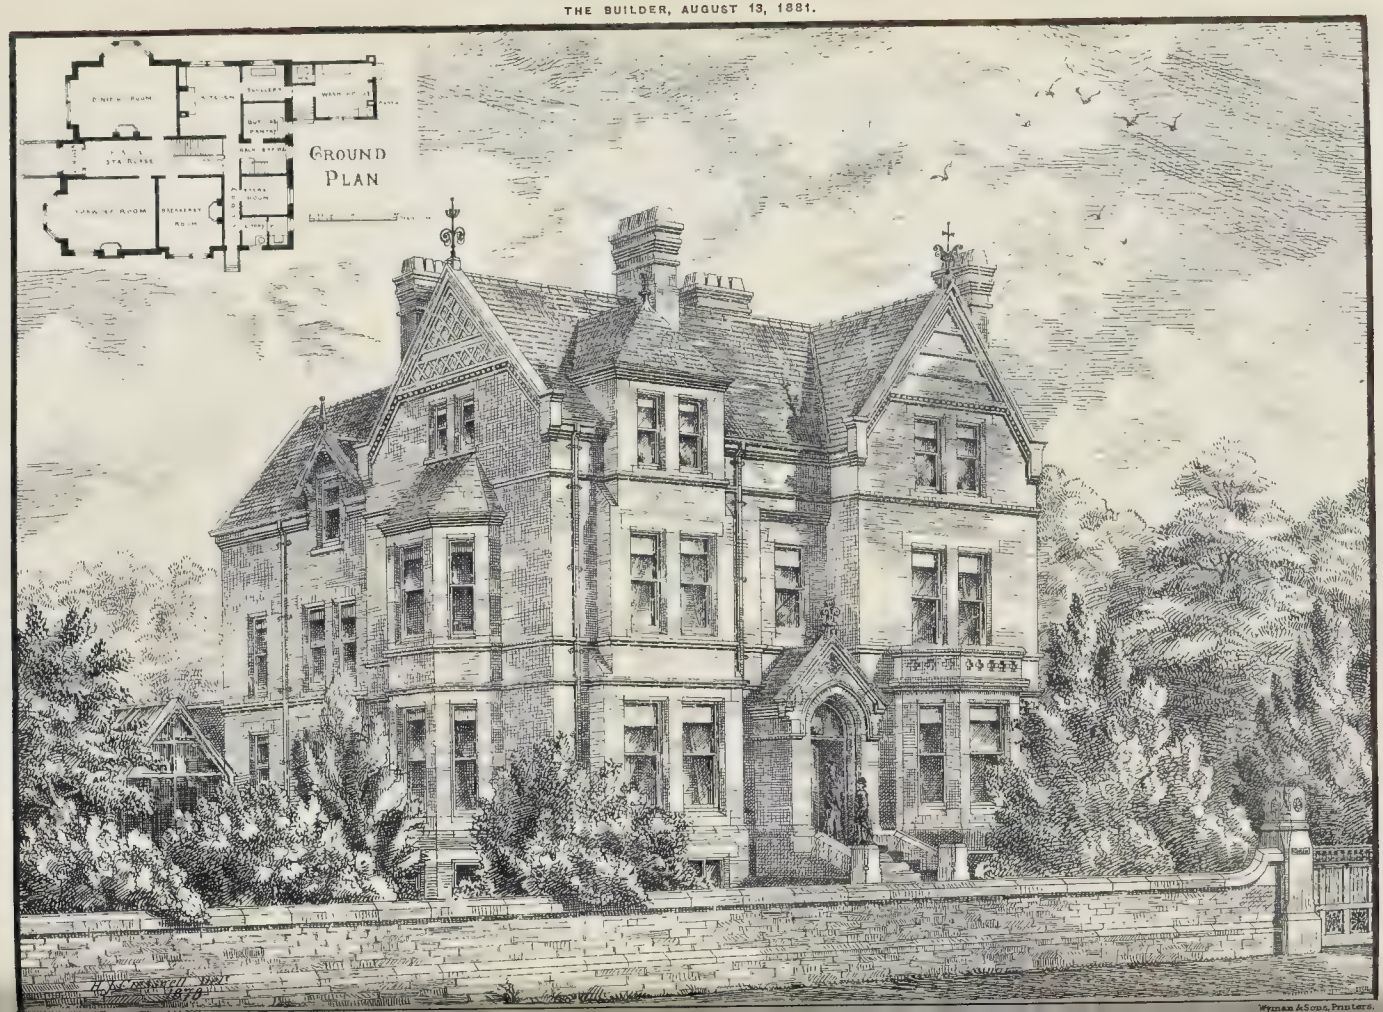
PRINCIPAL PORTAL OF LEON CATHEDRAL.

During the recent well-attended Agricultural, Industrial, and Art Exhibition held at Leon, in Spain, a national subscription was opened for the purpose of saving the magnificent cathedral of that city from the ruin with which it is threatened. The historic city of Leon was once the second capital of the ancient kingdom of the Asturias, where Alfonso III. and Fernando I. (both surnamed the Great) were wont to hold their court. Volumes might be filled with a descriptive history of the city, and with sketches of the artistic beauty of the cathedral church, the principal entrance of which is reproduced in the view which we give in our present issue. Leon Cathedral is doubtless one of Spain's architectural jewels, and is inferior only to the sumptuous edifices of Burgos and Toledo. The Spanish nation considers it a national duty to preserve this building, over which, according to the glowing language of an old Spanish writer, "the genius of art shook its brilliant wings of pearls and precious stones for the purpose of embellishing it with treasures."

A small plan of the cathedral will be found in Fergusson's "Hand-book of Architecture." It was commenced quite at the beginning of the thirteenth century, perhaps earlier, and possibly from the design of a French architect.

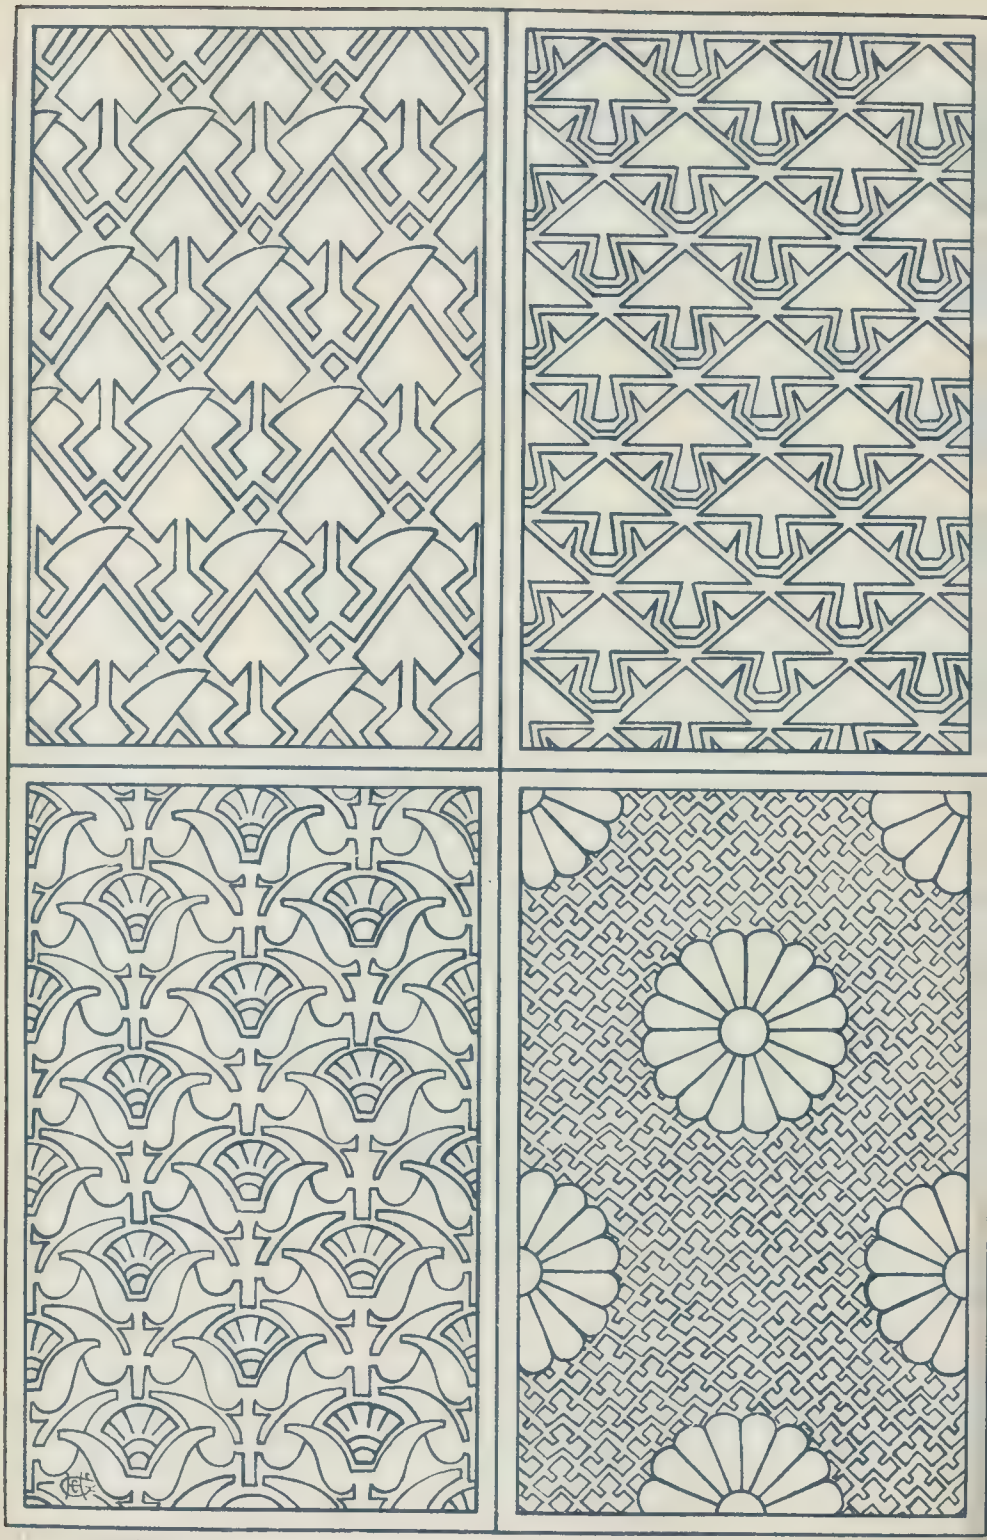
NEWLANDS, HEATON CHAPEL, NEAR MANCHESTER.

This house has been built for Mr. W. A. Russell-Pavier. The exterior is faced with local red stock bricks, relieved with moulded white brick strings from the Farnley Iron Company's works, Wortley, near Leeds. The stone dressings are from the Cefn Freestone Quarries, Ruabon. The roofs are covered with seconds Velinhelli dark blue slates, the ridges with red roll Staffordshire tiles. The internal joiner's work is of St. John's yellow pine, stained and varnished; the front staircase of pitch pine, with Baywood newels and handrail.



Mr. Thomas Newby, of Manchester, was the architect; and Messrs. T. & W. Meadows, of Heaton Norris, Stockport, were the builders.

PEVERIL HOTEL, THORPE, NEAR ASHBOURNE.



This hotel, belonging to Mr. Sydney Evershed, of Barton-on-Trent, is situate at the entrance to Dove Dale, Derbyshire, one of the most charming places in England. The whole of the half-timbered portion of the building is new, and constructed in wrought framing, the panels being of white fire-bricks from Pot Shrigley, near Macclesfield. These additions have been made to afford the increased accommodation required for the numerous visitors to the Dale, and include the ordinary rooms for casual visitors and rooms for dining for excursion parties, besides additional bedrooms, &c. on the upper floors. The buildings to the right of the hotel include extensive stabling and coach-houses.

The works have been carried out by Mr. Wm. Brown, builder, Manchester; the laying out and planting by Mr. Godwin, of Ashbourne; under the supervision of Mr. T. Waddingham, architect, Manchester, at a cost of about 2,000*l.*

Lanhydrock House, the Cornish residence of Lord Robartes, which was burnt down recently, is to be rebuilt on the old site, and in the old style, at a cost of 40,000*l.* Mr. Richard Coad is the architect.

SAVAGE ARCHITECTURE.*

The habitations of the people of the Soudan were found by Mr. Petherick to consist, without exception, of round conical huts called tukkel, made of a slender framework of poles, tied together with strips of bark, covered with reeds. They are easily constructed, and afford capital shelter from wind and rain, the heaviest gales blowing harmlessly over them. "It often struck me," says Mr. Petherick, "that for temporary purposes, as during fishing or shooting excursions in secluded localities, or to provide shelter for shepherds on distant moors or hills, they might be of service to any country. In the centre of the spot selected, a peg is driven into the ground, to which a cord half the length of the intended diameter of the hut is attached; this drawn round, marks a circle, and indicates the outline of its base. Holes about 1 ft. deep are then dug with a pointed stick, at distances of a yard from each other, on the line marked out; into these, stakes about the thickness of a man's arm are driven perpendicularly. The top of each stake is forked for the purpose of receiving a bundle of reeds or rods, like slender pea-sticks, which, lashed firmly together with strips of bark, form a circle at an elevation of generally 3 ft. or 4 ft. from the ground. Two poles, about a yard longer than the diameter of the hut, are then attached together with rushes or bark at one extremity, to open and close like a pair of compasses; the pointed ends when raised are thrust into the circle of the rods, and another pair of poles similarly tied together being fixed transversely to them at right angles, the foundation, if I may so express myself, of the roof is formed. A smaller circle of reeds, like a hoop in shape, is then attached underneath the poles near their extremities, about 2 ft. 6 in. in diameter, in order to secure them, and another similarly-formed circle, placed half-way between it and the larger one on the stakes, forms a good support for the rafters of the roof, each of which being pointed, is driven into the reeds which support the whole fabric. At regular distances from the base to the top slender reeds are attached, with bark or rushes, to the outside of the rafters to support the thatch, and thus the hut at this stage is constructed like a cage, without the employment of auger, hammer, or nail. The thatch, formed of the long reeds of the millet, is then put on, and the sides underneath being covered with the same material, leaving a small aperture to serve for door, window, and chimney, the hut is finished, not having cost the owner one para (the fortieth part of a piastre) for either material or construction. The reeds at the top of the conical roof are bound tightly together so as to prevent the rain from percolating through them, and, cut off square, form a finish to the hut, on which the storks are permitted to build their nests. Others to prevent them place a stick ornamented with ostrich eggs perpendicularly in the centre of the projection, the uppermost eggs being generally surrounded by ostrich feathers. The generality of the huts used as dwelling-houses are finished with a flat-roofed shed of some 12 ft. square immediately in front of them, which in the dry season forms the usual sitting-room. If the family is large, or more space is desired, the shed is constructed in an oblong form to the length required. It has a spacious doorway in front, through which light is admitted in sufficient abundance to dispense with windows, and is never closed when any of the family are at home. When they are absent, a piece of wicker-work is placed against it, and sustained in its position by a piece of wood, serves to keep out dogs, fowls, and cattle, and being a sufficient indication that the inmates are absent, no one will approach it. Locks are dispensed with, and as housebreaking is unknown, they are not required. The furniture of the shed consists of two or more "angeriba" of home manufacture. In a corner is the 'murakka,' a crude stone on which, with plenty of elbow-grease, they grind their corn. The opposite corner is furnished with a couple of large earthen pitchers containing water. Attached to the roof are rough baskets of cotton, several gourds used as drinking-vessels, and an empty water-skin or two reserved for the use of the family whilst labouring in the cornfields. At night this shed is the sleeping apartment of the elder children, whilst the hut is occupied by the man, wife, and infant, if they have one. Their bed is a mat on a large couch in the centre of the hut under a canopy, and completely enveloped by fixed curtains made of various coloured matting; the only access to it being through a small aperture left in one side. The hut is also the storeroom for the good-wife's crockery, which is suspended in strings to the roof; and a thousand other household necessaries are distributed with equal care and ingenuity in its interior."

The dwellings of the savage inhabitants of Southern Africa are described as wretched affairs; those of the Damaras especially. The women are the builders. They first cut a number of sticks 8 ft. or 9 ft. long, and also strip off quantities of bark from the trees, which they shred and use as string; holes are then "crowed," or dug with pointed sticks, in a circle of 8 ft. or 10 ft. across, in which the sticks are planted upright; their tops are next bent together and lashed with the bark shreds; this makes the framework; round about it brushwood is woven and tied, until the whole assumes a compact surface; a hole for a door 3 ft. by 2 ft. is left in one side, and a forked prop is placed in the middle of the hut to support the roof; the whole is then daubed and plastered over, and the work is completed. As the roof becomes dried and cracked with the heat of the fire, and, indeed, as it generally has a hole in it for a chimney, the Damaras lay ox-hides upon its top, weighting them with stones that they may not be blown off; these they draw aside when they want ventilation, but pull them over at night when they wish to make all snug. The furniture of the hut consists of a couple of ox-hides for lying and sitting on, three or four wooden vessels, a clay cooking-pot, a bag of pig-nuts, a leather box containing a little finery, such as red iron earth to colour themselves with, and a small skin of grease. There may, perhaps, be an iron knife and a wood chopper; everything else is worn on the person, or buried secretly under the ground. When they sleep the whole population of the hut lie huddled up together like pigs, and in every imaginable position round the small fire. They have nothing to cover themselves with.

In Caffre-land, the huts, which have the form of a hemisphere, are from 18 ft. to 20 ft. in diameter, and from 6 ft. to 7 ft. high; they are generally built by the women, poles being first stuck into the earth, from which flexible boughs are arched over the top. This bower-shaped wattle-work is thatched with straw, and plastered over with clay and cow-dung. A small aperture is left for the door, which is formed of basket-work and usually screened by a rustic sort of portal. The fireplace is formed in the centre, and the only outlet for the smoke is the doorway; to this may be attributed in a great measure the circumstance of the inmates of these rude dwellings being so frequently afflicted with weak or sore eyes. The floor is usually composed of the earth of ant-hills, which, by long exposure to the heat of the sun, has become dry and hardened, being thus well adapted for the purpose, and producing a smooth and even surface. A few mats to sit and sleep on, a small one to hold the food when dressed, a few coarse earthen pots of native manufacture for cooking, a basket of peculiar workmanship so closely woven as to be capable of containing liquor, and a bundle of assegais or spears, constitute the furniture of a Caffre hut. In that of a wealthy Caffre there is usually a milk sack made of bullock's hide, so closely sewn together as to prevent leakage, and capable of containing several gallons; but the poorer classes are content to keep their milk in calabashes. The food of these people varies with the seasons; their principal support is milk and a coarse description of unleavened bread made from a kind of millet called Caffre corn, roughly ground between two stones. Meat is only eaten on great occasions, such as marriages and other festivals, or when they are obliged to kill an ox for the support of their wives while engaged in the duties of cultivating the land and suckling an infant; or at the time when karrosses are required for the use of the family, which seldom happens more than once a year, and among the poorer classes not so frequently. They never eat salt, to which they have a decided aversion. The milk is poured into a leathern sack, as before described, which being placed in the sun, soon curdles; a mess of this, with a little Caffre corn, either boiled or roasted, is in their estimation a most delicious banquet. They preserve their corn in holes dug for the purpose, in the centre of their cattle kraal, covering it with manure, which, being trodden down and well hardened, generally protects it from the wet, and here they consider it as being more safe from the attacks of the marauders. Should it prove occasionally rather musty, it is considered by no means unpalatable, but, on the contrary, possesses a flavour agreeable to their taste. Before they sit down to eat in company, the Caffres are very careful to immerse their hands in cow-dung, wiping them on the grass, which is considered the perfection of cleanliness. Except an occasional plunge in the river, they never wash themselves; so the ordinary condition of their bodies may be very well imagined. On a fine day their karrosses are opened out in the sun and such specimens of insect life as show themselves meet speedy destruction. It often happens that one Caffre performs for another the kind office of collecting these insects, in which case he preserves the entomological specimens, carefully delivering them to the person to whom they appertained, supposing, according to their theory, that as they derived their support from the blood of the man from whom they were taken, should they be killed by another the blood of his neighbour would be in his possession, thus placing him under supernatural influence.

At Whydah, in Western Africa, the king alone enjoys the privilege of dwelling in a house of more than one story; and we are told that the tyrant Bossa Ahadee, desirous of letting the whole world see how much he honoured one of his favourite generals, actually gave him leave to build a house two stories high. The buildings are composed of posts as thick as a man's thigh, one placed at each of the four corners, and sunk into the ground about 1 ft. 6 in.; other smaller ones are placed between at the distance of about 2 ft., and the intermediate spaces are filled up by plaiting with twigs and wattles. The walls, which are about 6 ft. high, are plastered inside and outside with clay, which is left to harden in the sun; but to prevent their drying too quickly and cracking, they are frequently moistened with water, and allowed to stand for several days or weeks exposed, before the roof is put on. It is seldom that the house consists of more than one apartment, but sometimes it is divided by a partition of wattles plastered with clay, reaching, however, only as high as the outside walls. Sometimes a kind of ceiling is made to the apartments, consisting of small spars of bamboo laid very close to each other, scarcely strong enough to walk upon, and intended only as a store-room to preserve their goods, &c.; but in general the space from the top of the walls upwards is left open. For the sake of coolness, also, they leave the space of 1 ft. open between the upper part of the wall and the roof. The roof, which is of thatch composed of the branches of a species of bamboo, or of long grass, is generally of a conical form, which gives the town, at a small distance, the appearance of a collection of small hay-stacks. The roof, by projecting a few feet beyond the outer walls, forms a kind of piazza, which affords shelter from the rain; and here, in the dry season, the people spend much of their time, either swinging in hammocks, or reclined upon mats spread on a bank of earth raised about 1 ft. 6 in. high, and 2 ft. or 3 ft. broad, which runs round the outside of the house, except at the entrance. The houses have seldom any other openings than the doors, of which there are usually two, opposite to each other, and serving the purpose of keeping up a current of air; they also admit the light, and afford an exit to the smoke of the fire, which is made on the middle of the floor. The entrance of a house is seldom closed by anything but a mat, which is occasionally let down, and is a sufficient barrier against all intruders. The Africans are not much burthened with household furniture,—a few mats to sleep on, and cloths to guard them from the cold at night, an iron pot, a few calabashes, a copper kettle for water, a basket, with a small box for the women's clothes, constitute the chief part of it.

On the banks of the Upper Binne, in this same quarter of the globe, Bakie, the traveller, discovered a colony of savages whose architecture more closely resembled that of the beavers than any of the human species. "We advanced right into the middle of the village and found no resting-place; right and left, before and behind, all was water. People came out of the huts to gaze at the apparition, and standing at the doors of their abodes were, without the smallest exaggeration, immersed nearly to their knees, and one child I particularly observed up to its waist. How the interiors of the huts of these amphibious creatures were constructed I cannot

* See p. 153, *ante*.

conjecture, but we saw dwellings which, if inhabited, the natives must have dived like beavers to get outside. We pulled in speechless amazement through this city of waters, wondering greatly that human beings could exist under such conditions. We had heard of wild tribes living in caverns and among rocks. We had read of races in Hindostan roosting in trees, of whole families in China spending their lives on rafts and in boats on their rivers and canals. We knew, too, of Tuariks and Shanbah roaming over vast sandy deserts, and of Eskimo burrowing in snow retreats, but never had we witnessed or even dreamt of such a spectacle as that of creatures, endowed like ourselves, living by choice like a colony of beavers, or after the fashion of the hippopotami and crocodiles of the neighbouring swamps. A little distance from us we espied a large tree, round the foot of which was a patch of dry land, towards which we pulled, but grounding before reaching quite to it, Mr. May and I waded to it, instruments in hand, to take observations. We were barely allowed to conclude when nearly the whole population of the place, half wading, half swimming across a small creek, came upon us and stared at us in wild amazement. A hurried set of sights being taken, we carried our things back again into the boat, and as we wished to get another set about three quarters of an hour after noon, we tried to amuse ourselves and to spend the intervening time as best we could. We were now able to look a little more attentively at our new friends, who in large numbers crowded round, and who, male and female, were nearly all equally destitute of a vestige of clothing. One young man understood a few words of Hansa, and by his means we learnt that this was Dulto, of which we had heard at Djin, and that the inhabitants were of the same stock as at the other villages; but they were by far more rude, more savage, and more naked than any of the other Barbai whom we had encountered. A canoe came near us, lying in the bottom of which was a curious large fish, of which I had just time to make a rough eye-sketch, when I had to retreat to the boat; and Mr. May, who had been exploring in another direction, also returned. The behaviour of these wild people now attracted our notice. The men began to draw closer around us, to exhibit their arms, and to send away the women and children. Their attentions became momentarily more and more familiar, and they plainly evidenced a desire to seize and plunder our boat. A sour-looking old gentleman, who was squatting on the branch of a tree, was mentioned as their king; but if so, he made no endeavour to restrain the cupidity of his *sans culottes*. Part of a red shirt, belonging to one of our Krumen, was seen peeping out from below a bag, and some advanced to lay hold of it, when suddenly my little dog, who had been lying quietly in the stern-sheets, raised her head to see what was causing such a commotion. The sudden appearance startled the Dulto warriors, who had never seen such an animal before, so they drew back, to take counsel together, making signs to me to know if she could bite, to which I replied in the affirmative. Matters were beginning to look serious. Our crew, as usual, were timid, and Mr. May and I had only ourselves to depend upon in the midst of 300 or 400 armed savages, who were now preparing to make a rush at us. There was no help for it; we had to abandon all hope of our remaining observations, and of so fixing an exact geographical position. As at Djin, I seized a few trinkets, and handing them hastily to those nearest us, we shoved off while the people were examining those wondrous treasures."

From Western Africa to Eastern, and there we find the dwelling-house assumes its normal African form,—the circular hut described by every traveller in the interior, and especially by Capt. Burton, to whose account of the architecture of Eastern Africa we are, in the following descriptions, much indebted. Dr. Livingstone appeared to judge rightly that its circularity is the result of a barbarous deficiency in inventiveness. It has, however, several varieties. The simplest is a loose thatch, thrown upon a cone of sticks, fixed in the ground, and lashed together at the apex. It ignores windows, and the door is a low hole in the side. A superior kind is made after the manner of our ancient bee-hives. It is cup-shaped, with bulging sides, and covered with neat thatch cut in circles, which overlap one another tile fashion. At a distance it resembles an inverted bird's-nest. The common shape is a cylindrical framework of tall staves or the rough trunks of young trees planted in the earth, neatly interwoven with parallel and concentric rings of flexible twigs and withes. This is plastered inside and outside with a hard coat of red or grey mud. In the poorer tenements the surface is rough and chinked; in the better order it is carefully smoothed, and sometimes adorned with rude imitations of life. The diameter averages from 20 ft. to 25 ft., and the height from 7 ft. to 15 ft. in the centre, which is supported by a strong roof-tree, to which all the stacked rafters and poles converge. The roof is subsequently added: it is a structure similar to the wall interwoven with sticks, upon which palm-fronds are thrown, and the whole is covered with thatch tied on by strips of tree-bark. It has eaves which, projecting from 2 ft. to 6 ft.,—under which the inhabitants love to sit and shade themselves,—rest upon horizontal bars, which are here and there held by forked uprights, trees rudely barked. Near the coast, the eaves are broad and high; in the interior, they are purposely made so low that a man must creep in on all fours. The doorway resembled the entrance to an English pig-sty; it serves, however, to keep out the heat in a hot season, and to keep in smoke and warmth during the rains and the cold weather. The threshold is garnished with a horizontal log or board that defends the interior from inundation. The door is a square of reeds fastened together by bark or cord, and planted upright. In the colder and damper regions, there is a second wall and roof outside, the first forming, in fact, one house within the other. Westward of Unyamwezi in Uvinza, and about the Tanganyika Lake, the round hovel again finds favour with the people, but even there the Arabs prefer to build for themselves the more solid and comfortable tembe. The tembe wants but the addition of whitewash to make it an effective feature in African scenery; as it is, it appears from afar like a short line of raised earth. The form is a hollow square or oblong, generally irregular, with curved projections and semi-circles; in the East African Ghauts the shape is sometimes round or oval to suit the exigencies of the hill sides and the dwarf cones upon which it is built. On the mountains and in Ugogo, where timber is scarce, the houses, from the continued frontage of the building, which is composed of mimosa trunks, stout stakes, and wattle and dab, rarely exceed 7 ft. in height. In the southern regions of Usagara, where the tembe is poorest, the walls are of clods loosely put together and roofed over with a little straw. About Mesene, where fine trees abound, the tembe is surrounded by a separate palisade of young unbarked trunks, short or tall, and capped here and there with cattle skulls, blocks of wood, grass wisps, and similar talismans; this stockade in damper places is hedged with a high thick fence, sometimes doubled and trebled, of pea-green milk-bush, which looks pretty and refreshing, and is ditched outside with a deep trench serving as a drain. The cleared space in front of the main passage through the hedges is often decorated with a dozen poles placed in a wide semicircle to support human skulls, the mortal remains of ill-conducted Boers. In some villages the principal entrance is approached by long, dark, and narrow lanes of palisading. When the settlement is built purely for defence it is called Kaya, and its head-men Muinyi Kaya; the word, however, is sometimes used for Boma or My, a palisaded village in general. In some parts of Unyamwezi there is a Bandani or exterior booth, where the men work at the forge or sit in the shade, and where the women husk, pound, and prepare their grain for cooking.

The general roof of the tembe is composed of mud and clay heaped upon grass thickly strewn over a framework of rafters, supported by the long walls. It has usually an obtuse slope to the front of another at the rear, that rain may not lie; it is, however, flat enough to support the bark-bins of grain, gourds, old pots, firewood, water-melons, pumpkins, manaioc, mushrooms, and other articles placed there to ripen or dry in the sun. It has no projecting eaves, and it is ascended from the inside by the primitive ladder, the inclined trunk of the tree, with steps formed by the stumps of lopped boughs. In each external side of the square one or two doorways are pierced, which are large enough to admit a cow. They are jealously closed at sunset, after which hour not a villager dares to stir from his home till morning. The outer doors are sometimes solid planks; more often they are three or four heavy beams suspended to a cross-bar passing through their tops. When the way is to be opened they are raised from below, and are kept up by being planted on a forked tree-trunk inside the palisade; they are let down when the entrance is to be closed, and are barred across with strong poles. In Unyamwezi the centre is sometimes occupied by the Iwanza, or village "public-house." Of these buildings there are generally two in every settlement, built at opposite sides, fronting the normal Mremba-tree, which sheds its filmy shade over the public court-yard. That of the women is a species of harem, it is very seldom visited; as travellers and strangers are always admitted into the male. Iwanza it is more readily described. This public-house is a large hut, somewhat more substantial than those adjoining, often smeared with smooth clay, and decorated here and there with broad columns of the ovals before described, and the prints of palms dipped in ashes and placed flat, like the hands in ancient Egyptian buildings. The roof is generally a thatch raised a foot above the walls, an excellent plan for ventilation in these regions. Outside the Iwanza is defended against the incursions of cattle by roughly-barked trunks of trees resting upon stout uprights; in this place the men sit, converse, and smoke. The two doorways are protected by rude charms suspended from the lintel,—hares' tails, zebras' manes, goats' horns, and other articles of prophylactic virtue. Inside, half the depth is appropriated to the Ubiri, a huge standing bedframe, formed like the plank-benches of a civilised guardroom, by sleepers lying upon horizontal cross-bars; these are supported by forked trunks, about 2 ft. long, planted firmly in the ground. The floor is of stamped earth. The furniture of the Iwanza consists of a hearth and grinding-stone; spears, sticks, arrows, and shillelahs, are stuck to smoke in the dingy rafter-ceiling, or are laid upon hooks of crooked wood depending from the sooty cross-beams; the corners are occupied by elephant-spears, and similar articles. In this public-house the villagers spend their days, and often, even though married, their nights, gambling, eating, drinking pombe, smoking bhang and tobacco, chatting and sleeping, like a litter of puppies, destitute of clothing, and using one another's backs, breasts, and stomachs, as pillows. The Iwanza appears peculiar to Unyamwezi.

The Red Indians are not wanderers by nature but rather from necessity; most of them live in tents made of buffalo-skins, or the bark of trees which are as picturesque as they are original. These tents are generally of the shape of a reversed funnel; the opening at the top serves at once as a window to admit light and air, and as an egress for smoke. The door, which does not close, is low and narrow. These tents are generally very spacious, of an average 20 ft. in height by 30 ft. or 40 ft. in width; with rare exceptions they are very clean in the interior. The Indians have, like Europeans, some idea of comfort and even elegance in their dwellings. Among some tribes, especially the Crows, the Blackfeet Indians, and the Comanches, the skins destined to cover the tents are prepared with as much care as those employed for making tunics or mocassins. Some of these skins prepared by the Comanches are very soft to the touch, and brilliantly white inside; many were even ornamented with designs in coloured marquetry, representing sometimes a buffalo hunt, sometimes groups of arms and shields, arranged with great art. The tents are generally only provisional dwellings, constructed for the duration of a halt or of a season at most. When a tribe becomes stationary, or at least intends to remain a long time in the same country, it builds small habitations of a more solid description, which afford better protection against the inclement of the season. In the north-west of America the Indians build huts of the trunks of trees for the winter, like those the Americans call log-houses. They are constructed of blocks of wood cut square, placed side by side, and joined together by a mortice at both extremities. The cabins are of an oblong shape, and the door is narrow, low, and on a level with the ground, so that it is often necessary to kneel down to pass into the interior; a thatched roof completes this rude and primitive dwelling.

The Shoshones, above all those who live in the midst of the mountains of Utah, inhabit caverns in the rocks. The Chinook build their houses of thick and broad planks, which they prepare with great trouble out of the trunks of large fir-trees, which grow in great abundance in their country. The houses are oblong, and two rows of beds ranged one over the other,

like berths in a ship,—are placed against the wall.

In Oregon, the habitations of the Indians are generally mere huts, six or ten yards long, conical in shape, and crossed in the interior by beams, which are used for drying salmon. The Indian huts on the banks of the Columbia are for the most part constructed of the bark of trees, pine branches, and brambles, which are sometimes covered with skins or rags, and have a very squalid appearance. Round about are scattered in profusion the bones of animals, the refuse of fish, and heaps of dirt of every description. In the interior roots are piled up in heaps, skins and dried salmon are suspended from poles, and round the wicker cauldron crouch human beings of the most repulsive aspect, their faces covered with grease and dirt, their hands and whole persons disgustingly dirty.

The houses of the Pawnees are circular, and generally about fifty yards in circumference. They are formed of young trees planted at regular distances, whose summits, bent inwards, rest on an equal number of posts driven circularly into the ground. This framework is covered with the bark of trees, earth, and green herbs, which give these cabins the appearance of natural hillocks of grass, or of gigantic beehives. Light and smoke pass through openings in the centre of the roofs of these rustic dwellings, which are warm in winter, and very cool and comfortable in summer.

The Indian habitations, says the Abbé Dominech, who furnishes us with these particulars, are about as various as the tribes, each being distinguished from the others by its form, material, and style of construction. Thus, the cabins of the Omahas, which are circular, like those of many other tribes, have this peculiarity, that they are decorated in bright colours of a beautiful effect,—a fashion not adopted by the neighbouring tribes. The dwellings of the Hamaths have only an opening at the summit, which serves at once as door, window, and chimney. The Natchez used to build themselves solid houses five yards square, of a kind of mortar composed of wood, mud, sand, and moss, called by the Creoles "barbe-espagnole." The roof, made of reeds and grass, often lasts twenty years without needing repair. A very low and narrow door, like that seen in the pueblos of New Mexico, was the only opening in the house.

Most of the Comanches, like the Sioux of the Missouri, have dwellings which are in no way comparable to those of the Mandans. Their hut is the traditional wigwam, which can be set up easily at every halt, and then carried away a considerable distance. Its shape is always that of a reversed funnel, and it is made of buffalo skins or birch bark. It is never very large; provided there is sleeping-room for every member of the family, nothing more is needed, the rest of their time being passed in the open air.

The Needle-Hearts and several tribes of Columbia generally make their tents of mattings of reeds, stuck into the ground, and raised in the middle on a slight timber-work. In the south of Upper California, New Mexico, and Utah, and on the banks of the Gila and the Colorado, some populations are met with who inhabit great cylinders of birch bark, or of reed matting.

The Navajos live for the most part in cuneiform huts, not unlike those of the Pawnees. Some are of bricks baked in the sun, others are made of the branches of trees, or of reeds covered with mud, but very pretty in appearance. They are generally scattered among fine fields of maize, or beautiful orchards of fruit-trees. The Indians remain very little within their wigwams. The principal work of the women, the preparation of skins, is always done in the open air; the men are generally out hunting or fighting, and when they return to the villages, they smoke and talk in groups on the grass of the fields, and only enter their dwellings to eat or sleep. Winter alone forces them to shut themselves up in their frail habitations, which protect them but imperfectly from the severity of the weather, and yet deprives them of the pleasure of contemplating external nature, for which they have a real passion, even when the elements are convulsed, and seem to threaten everything with destruction.

The cabins of the Mandans are made of wood covered with clay, which acquire, by exposure to the sun, a solidity almost equal to that of stone. They are of the shape of a flattened cone; the ground being hollowed out to serve as floor and foundation; there are generally two or three steps to descend on entering. The roof, made of a solid framework of wood, intermingled with branches of trees and covered with clay, forms, notwithstanding its inclination, an agreeable and convenient terrace, where the Mandans often resort to smoke and converse in the evening, and where in summer they often sleep. The interior of these round huts is about 50 ft. in diameter. The walls are constructed of enormous beams a foot thick, the first row of which is solidly fixed in the ground, and serves as a foundation, rising in a circle 5 ft. or 6 ft. above the surface of the soil; a second row rests at one end on the first, and at the others leans against a third which forms the roof, and which is supported by transverse beams and perpendicular pillars rising from the ground. This woodwork is covered externally with a layer 8 in. or 10 in. thick of willow branches to prevent the wood from becoming penetrated with damp and growing rotten. These half-subterraneous dwellings only receive light and air through an opening 10 ft. or 12 ft. in circumference at the summit of the building. The hearth, which serves as a kitchen, is hollowed out in the ground immediately below the opening, and is sufficiently well constructed to resist the action of the fire. It is generally about a yard in width, but sometimes, when a family becomes numerous, it is increased in size, so that every one may find a place in the circle of which the hearth becomes the centre in winter. The beds are placed against the wall all round the cabin, as in our school dormitories. They are made of woven willow branches, and placed about 2 ft. from the ground on props; a buffalo skin freshly taken off the animal is laid over this matting, fur upwards, and as it dries adheres to the willow branches, and forms a tolerably soft mattress. Having little taste for the perpetual combats entailed by a wandering life, the people have grouped themselves for mutual protection and defence in fortified villages. The fortifications consist of a wall of trunks of trees, 15 ft. or 20 ft. in height, and firmly fixed in the ground; a small space is left between the trees for observing the enemy, and for the passage of the arrows showered on the assailants. Within this wall, which entirely surrounds the village, there is a ditch, in which the defenders of the place conceal themselves in order to discharge their arrows with more security.

A. T. Sibbald.

CRYSTAL PALACE ENGINEERING SCHOOL.

The twenty-sixth term of this school was closed on Saturday last, when, as usual, a large number of the parents and friends of the students and others interested in the school met in the south tower of the Crystal Palace, where the school premises are situated, to see the work of the students and to be present at the presentation of the certificates. The work of the students in the drawing-office and in the pattern and fitting shops was much admired; the out-door work of the students in the Colonial section excited special interest. There were sixty students in the school during the term, including eight in the Colonial section.

Mr. McGeorge, chairman of the Crystal Palace Company, was present, and took an active part in the proceedings. The certificates awarded to the successful students were presented by Mr. Alfred Giles, Memb. Council I.C.E.

The theoretical part of the students' instruction is communicated by lectures, delivered twice a week, by Mr. J. W. Wilson, the principal, with occasional additional lectures by Mr. J. W. Wilson, jun., his chief assistant, and special lectures by other gentlemen. The students are required to answer, in writing, about 400 questions relating to the lectures.

The lectures for the last term have been on "Railway and Dock Work." Thirty-one students attended the lectures; twenty-six were eligible for examination, and fourteen passed satisfactorily. Mr. H. Skinner was first, with 222 marks, and also first in order of merit in the fitting-shop; Mr. H. Sadler is second, with 219 marks, and first for drawing; Mr. W. T. C. Beckett has 215 marks, and is second for fitting; Mr. E. S. Tiddeman has 209 marks, and is first for pattern-making. The remaining ten students, who passed for lecture examination, had from 191 to 134 marks. Ten students had certificates for work in the drawing-office; seven for work in the pattern-shop; and ten for work in the fitting-shop.

In the Civil Engineering section (first term), for general surveying, preparations of plans, sections, &c., for Parliament, Mr. W. Martin was first, and Mr. A. Scratton, second. Second term, for calculation of strains and the preparation of general and working plans, specifications, and estimates of a railway and dock, Mr. A. E. Nichol, first; Mr. H. A. F. Smith, second. Third term, Mr. J. G. Gerds, first; Mr. W. H. Jordan, second.

Mr. Giles delivered an interesting practical address to the students, congratulating them upon the advantages they enjoyed in such a school. He was acquainted with several engineering schools, but in the efficiency and thoroughness of the training and instruction given, theoretical and practical, he knew of nothing superior, if anything equal, to this school. There were vast fields open for the engineer in the colonies and abroad, if not in this country. The Institution of Civil Engineers, which had existed for sixty-three years, had 1,100 members, and 800 associates; in seven years 400 engineers had gone out from it to fulfil professional duties, which was a very small contribution towards the demand for the works that awaited them. There was no royal road to distinction in engineering,—they could only achieve it by hard, persevering study and work, and by making the best use possible of their opportunities.

Messrs. A. D. Fox, M. Inst. C.E., and T. H. Blakesley, M.A., A.-M. Inst. C.E., were the examiners. They report their "high satisfaction with the method of the instruction pursued in the various departments."

Mr. Wilson, the principal, in acknowledging a vote of thanks, gave two illustrations of what students might do by making the most of their powers. One of them, who was almost entirely deaf and dumb, had done very meritorious work in the drawing-office, and had even been eligible for examination on lectures. Another, who had lost his right arm in a Mexican war, had also done remarkably well in the drawing-office. This student had been to Geneva since he had lost his arm, and from what he learned there was able to make excellent watches, and he carried a valuable chronometer of his own making.

The Colonial students, with Mr. West as captain, camped out for a fortnight before the close of the term, sleeping in tents, and doing their own cooking at a camp fire of their own construction. Their fireplace, of stone and clay, with a few iron bars, accommodated three cooking utensils at once. The cellar and pantry were in the hollow of the Megatherium, close to the camp. The outdoor work of the students consisted of the erection of two stout bridges over an arm of the lake; one of them a single-span spar-bridge, the other a floating bridge on barrels lashed together. Any one who witnessed the rough, ready, and rapid manner in which the tents were struck, the bridges taken to pieces, and the camp dismantled, would conclude that such young fellows are admirably fitted for camp or colonial life, and that they cannot fail to profit by their training and experience at the Crystal Palace School.

TRADES' GUILD OF LEARNING.

A public meeting in support of the objects of this society was held on Monday evening last in the Hall of the Society of Arts. The meeting was the outcome of a conference held at the house of the Earl of Rosebery about a month since, with the object of obtaining increased support from the public for the Trades' Guild of Learning, and reorganising it on a broader basis. At the conference referred to, it was strongly recommended that the Guild should undertake, as a regular part of its work, to provide lectures on the history of the higher branches of industry and the principles of art or science underlying them, in order to stimulate the desire for superior technical instruction, and to assist in filling the classes to be organised by the City and Guilds of London Institute and similar associations. The chair at the meeting on Monday last was taken by the Earl of Rosebery.

Professor G. C. Warr, one of the hon. secretaries, said that a number of letters of apology for inability to attend the meeting had been received, including one from Mr. Blanchard Jerrold, who suggested that an exhaustive review of French methods of technical education should

be drawn up. "We want in England," said the writer, "primary trade schools where the elements of science, skill, and taste shall be taught and spread over the country. The reason why French artisans excel in taste, ingenuity, and neatness of work is to be found in the elementary trade schools which are to be found everywhere in France." The Professor went on to give a brief sketch of the history and work of the Guild, which, he said, was calculated to do an immense amount of good to the workmen, not of London alone, but of the country generally. Some valuable lectures had been given under the auspices of the society, including those by Mr. William Morris on the principles of house decoration. It was, however, proposed to rely in future less on lectures than on systematic class teaching. To carry on this work the co-operation of the trade societies would, it was hoped, be secured.

The Earl of Rosebery said the objects of the meeting were to ascertain to what extent a desire existed amongst workmen for a continuation of the Guild; and secondly, to try and make known to a larger audience than they had yet appealed to the objects of the association. There were several technical schools now being built or established in London, and the first stone of one institution of the kind was laid a few days ago. In France, Germany, Italy, and other countries, such schools had existed for many years to the great advantage of the workmen living there, and to the injury of workmen here, in the matter of competition. The desire of the association was not so much to give instruction in actual handicrafts as to impart the theory, history, and principles of such craft. Such instruction would raise a craft in the estimation of its followers, who would obtain a higher conception of the importance and value of their work. No trade existed but had its history and theory. Without such knowledge of its history no craft would be interesting; nor would any institution be so. A great number of institutes existed for elevating and spiritualising all kinds of people, very often much against those people's will. There was but one really efficient basis for their guild, and that was the support of the working man himself. If it was to have any vitality it must be formed on the wishes and instructions of those for whom it was intended. If the Guild could not obtain the hearty co-operation of working men, he would be no party to its continued existence.

Mr. Thomas Burt, M.P., moved the following resolution:—

"That this meeting approves and pledges itself to support the objects proposed by the Trades Guild of Learning, viz.: (1) To provide lectures on the history and principles of various industries, with a view to encourage the desire for improved technical education; and (2) To continue the general education which the Guild has carried on for some time by means of lectures and classes."

The speaker enlarged on the importance and necessity of the work sought to be done by the Guild, and argued that it was the duty of all trade societies to help in the work. He did not want to see trade societies content to remain what they had been,—perhaps, to too great an extent,—in the past, viz., mere fighting institutions. He wanted to see them do more to improve the moral, intellectual, and social condition of the workman. That they could do much in that direction he showed by quoting what had been done by the Northumberland Miners' Associations in inducing the coal-hewers of that district to attend lectures on political economy. Many of the men walked several miles after working all day in the pits, to attend these lectures, which were given at three different centres, the average attendance at each centre being between 300 and 400. Out of about 1,000 persons who attended the lectures, fully nine-tenths of them passed the examinations which were subsequently held. Mr. Burt concluded by expressing his agreement with the chairman as to the necessity of the Guild being supported by the workmen themselves, if it were to be of any real service. Nothing would be done without the exercise of the virtue of self-help and self-reliance on the part of the workmen.

Mr. George Augustus Sala seconded the motion, observing that various remarks had been made as to what should be the attitude of the Guild with regard to the advancement of purely technical education, but he was rather disposed to think that, without interfering directly with any scheme of technical education, and without trenching on the operations of any other institution, it should be the aim of the guild to inculcate learning, — knowledge, — amongst workmen. Knowledge, it had been said, was power. He did not know that such was always the case, but this he did know, that knowledge was happiness, and the pursuit of happiness was one of the rights of man, as stated in one of the noblest pieces of prose that was ever written, viz, the American Declaration of Independence. The pursuit of knowledge would ever be the pursuit of happiness to all diligent seekers after it. True learning taught men to be humble, not with the humility of a Uriah Heep, but with a humility which the more they knew impressed them with the feeling that the sum of all their knowledge was but as the shadow of the shade of smoke, and that they were themselves but as infinitesimal grains of sand held in the hands of the Almighty. In conclusion, Mr. Sala spoke of the services rendered to the cause of popular education by Brougham, Grote, Dr. Birkbeck, and the Society for the Diffusion of Useful Knowledge.

The resolution was carried unanimously.

Mr. Hodgson Pratt moved the following resolution,—

"That the Trade Societies should be urged to co-operate as far as possible in organising the proposed lectures and classes; and that the Council should specially invite the support of the large employers of skilled labour in London."

The speaker referred to the great development which had taken place of late years in the matter of providing technical schools for artisans and apprentices among Continental nations, and quoted instances in which industries had left one country to return again when due attention was paid to technical instruction. After giving an exhaustive review of what had been done in this country of late years towards supplying defects in technical education,—incidentally remarking that much of the work of the Science and Art Department, well-intentioned though it was, had failed because the teachers of classes under the auspices of the Department were unable to practically exemplify the theories which they propounded,—the speaker referred to the Artisans' Institute, now about to be (as we lately reported) merged into the City and Guilds of London Institute, and concluded by saying that the Trades' Guild of Learning, if it were to succeed, must be supported by working men themselves, and carried on in deference to the views of workmen.

Mr. Phillips, in seconding the motion, expressed the opinion that the intention of the Guild to provide, besides technical classes and lectures, lectures on other subjects of interest to workmen, was a laudable one. No intelligent workman, for instance, could listen to a lecture on health and its conditions by such a man as Dr. Richardson without striving to better the home surroundings of himself and family. Again, lectures on Shakspearian and other subjects were heartily appreciated.

Mr. Alsager Hay Hill thought that all subjects other than those directly calculated to make the members better workmen would be best excluded from the programme of a trades' guild of learning. He wished to know whether the Guild would keep its doors open to all apprentices, and even to clerks and others who wished to learn a trade? If so, did the Guild expect to receive the co-operation of the trade societies, most of which strictly limited the number of apprentices allowed? Was the Guild prepared to examine workmen as to their efficiency and to grant certificates or diplomas of competency?

Mr. Thomas Paterson thought that the possession of such a certificate or diploma would be greatly esteemed by a workman.

Professor Ayrton said that such technological examinations as were referred to had been for some years past carried out in all parts of the country, at first by the Society of Arts, and latterly by the City and Guilds of London Institute. Replying to some criticisms as to the erection of the central institution of the City and Guilds Institute at South Kensington, the Professor pointed out that at Cowper-street, Finsbury, and in other parts of London, the Institute was, and had been for some time past, doing good work, and in the course of a few years they hoped to have an efficient technical school in every quarter of London.

The motion was carried, as was a vote of thanks to the Chairman, Lord Rosebery. This motion was supported by Mr. Hooper (who gave a very interesting account of what he, aided by one or two earnest friends, had done for technical education amongst carriage-builders), and by Mr. George Shipton, organising secretary.

Mr. E. Marjoribanks, M.P., who had taken the chair in succession to Lord Rosebery, briefly replied, and the meeting terminated at a late hour.

THE APPROACHING MEETING OF THE BRITISH ASSOCIATION.

A FEW MODEST SUGGESTIONS.

Not having a very agreeable recollection of the last meeting at Swansea, I venture to make a few suggestions for the meeting at York on the 30th inst., attention to which I am bold enough to think would greatly enhance the usual objects of the meeting, and contribute to the comfort of the members and visitors.

In the first place, I would suggest that the secretaries should make known the arrangements that have been made with the railway companies. I called at the Great Western Station last year, at five o'clock on the 23rd of August, and the clerk told me that they had no notice of the meeting. I took upon myself to tell the station-master that there would be a large accession of passengers for Swansea on the following morning, and that he had better provide extra carriages. He received this notice gratefully, and in the morning the additional carriages being ready prevented much confusion. It is true that on the morning of the 24th the ticket-clerks were aware that an allowance was to be made to the members visiting the meeting, but the majority of those who were going did not, and I believe that not more than a third availed themselves of the privilege liberally accorded by the railway company. One inference from this is that, if it had been made widely known, more persons would probably have joined the meeting.

The next and most important hint that I venture to give is to the president and those who read papers, that if they wish to instruct, to broach a theory, or to maintain an opinion, it is necessary that they should be heard. I have the highest possible respect for Professor Ramsey, for example, but the following will illustrate what his address was to me and others who sat about the centre of the hall:—

"It is unnecessary for my present purpose to enter into details connected with the recurrence of marine formations, since all geologists know that the greater part of the stratified rocks were deposited [*then putting his face close down to his notes*] in the s— as pro——."

All or nearly stratified formations have been in a sense metamorphosed, since, excepting certain limestones, the fact of loose incoherent sediments having been by pressure and other [*face down*] tur in sol——."

These paragraphs may be found in full a page 2 of the published address. It would occupy too much space to illustrate the twenty-two pages. It may be said that one can read the papers and addresses afterwards; but then one had better stay at home and do so quietly. I would venture to add that the papers read should not bear the evidence of haste. It is a prone thing, perhaps, to be a ready writer; but the fact of boasting that a paper was written in an hour leaves too often only the evidence of an invertebrate production, slovenly and incomplete, or in bad manuscript which the author himself has difficulty in reading.

How different was the case with Sir Richard Temple and his paper on the railway to Candahar. It is said that he rehearsed it in private with his brother, who made its exquisite illustrations; and the consequence was that there was not a single word lost, not a hitch in the narrative, or a delay in finding the drawing to which allusion was being made.

Then, to those who take part in any discussion that ensues, I would humbly suggest that it is the audience and not the diagram that has to be convinced. At the last meeting I had a dozen experiences of men seizing a piece of chalk and with their backs to the audience, holding a long and animated, but inaudible, conversation with the black board, which I hope was converted to the views of the objector, but of this I can give no opinion, not having been taken into the confidence.

I next venture to suggest that the local committee should intercede with the Dean of York to allow the cathedral to be seen without the intervention of an illiterate verger. A sum should be charged to the members and visitors to compound for the sixpence a head.

The following is a portion of what I heard on the 28th of July last. After the morning service we were all gathered together that we

night insert our names in a book and pay the sixpences. We were then taken into the choir, and heard a long dissertation on Martin and his firing the church. "I can recollect it," quoth the verger, "so you see I am no chicken." Coming out into the south aisle he points to the gates and says, "The minster is dedicated to St. Peter. The keys on the gate is the emblem of St. Peter; they are 400 years old." And so on till we came to a monument that had this importance: "Where they lived is now occupied by Sir George Wombwell." We were subsequently taken into the crypt, where we heard the following:—"I am now going to show you the first Saxon church. Now there's not one in twenty among you that knows what Saxon architecture is, I lay!" I expected a disquisition on long-and-short work, but it ended in,—"Well, it is what is called herring-bone. You see those stones,—the way they are put. I hope you will recollect all that I have told you, or else I have wasted my breath." We then marched to what he said was the finest of all. Then opening a door he pointed out that this was the *veste bull* of the chapter-house. "It is in the chapter-house," said he, "that Convocation is held. There's not many here, I dare say, who knows what convocation is. There's only two Convocations," and so on. This after Willis's production of 1846, and those who preceded and followed him in illustrating the architecture and history of this grand old edifice.

The names in the book before mine were of several visitors from Massachusetts. Would the swaddle I have quoted remind them of the author who was born in that state, and who said, "A Gothic cathedral is surely the most wonderful work which mortal man has yet achieved; so vast, so intricate, and so profoundly simple, with such strange, delightful recesses in its grand figure, so difficult to comprehend within one idea, and yet all so consonant that it ultimately draws the beholder and his universe into its harmony. It is the only thing in the world that is vast enough and rich enough"?—"Our Old Home," by Hawthorne, vol. ii., p. 202.

There is another suggestion for the local committee which perhaps, is not so easy as an appeal to the Dean. It is that the authorities in connexion with the bridge should issue a weekly ticket for the members, to save the trouble and annoyance of having to fish out a half-penny every time one moves into the city and returns. In these days of free bridges it is very irksome to have a toll-keeper pouncing on you like a gigantic spider for a contribution that I should think never accumulated sufficiently to pay for the cost of the structure. Would it be too much to ask for some information on this point to be contributed to the Statistical Section?

F. S. A.

AWARDS, PARKES MUSEUM INTERNATIONAL EXHIBITION.

The following are the complete lists in the sections concerning which our readers are likely to be most interested:—

Section XIII.

DOMESTIC AND HOSPITAL ARCHITECTURE: PLANNING, CONSTRUCTION, AND DECORATIVE MATERIALS.

JUDGES.

Sir Joseph Fayrer, F.R.S.; George Aitchison, A.R.A.; Fred. J. Mouat, M.D.; Edward C. Robins, F.S.A., M.R.I.B.A.; P. Gordon Smith, F.R.I.B.A.; Professor Thomas Roger Smith, F.R.I.B.A.; Henry Saxon Snell, F.R.I.B.A.; Alfred Waterhouse, A.R.A.

FIRST CLASS.

Robert Adams, reversible windows and adjustable door-springs; Henry Doulton & Co., art stoneware; Charles Drake & Co., marble concrete; Capt. Douglas Galton, C.B., hospital plans; Howard & Sons, parquet flooring; Hulse & Horn, Balmain's luminous paint; Russell and Erwin Manufacturing Company, locks and lock furniture; Sions, Toilet, hospital plans; Wilcock & Co., architectural glazed ware; T. Worthington, F.R.I.B.A., hospital plans.

AWARD OF MERIT.

Albissima Paint Company, white Paint; Artisans', Labourers', and General Dwellings Co., Limited (Rowland Plumbe, architect), plans of dwellings for artisans and labourers; Lawrence Booth, F.R.I.B.A., plans for dwellings; M. Bordiau, plans for warming and ventilation of public buildings; Bryden & Sons, bell-hanging apparatus; Candy & Co., damp-proof bricks for building and paving; Coe & Robinson, architects, hospital plans; J. Finch & Co., bisque glazed bricks and other building materials; Grantham, jun., & Denton, jun., designs for abattoirs; Hobbs, Hart, & Co., locks and safes; Maguire & Co., oxidised iron (Banff's process); G. E. Pritchett, F.S.A., corrugated ventilating pipes, and system of construction; Silicate Paint Company, washable distemper; Smith & Turner, door springs, water bars, and bolts; A. Smith & Stevens, sill bars and casement bolts, spring hinges, door knobs, and locks; Spence's Metal Manufacturing Company, Spence's metal; James Stiff & Sons, art stoneware vases, &c.; W. Tonks & Sons, sash and fanlight fasteners and openers, steel sash-lines, bolts, chains, and other door furniture, and wedge casement stays; E. Turner, F.R.I.B.A., hospital plans; Fredk. Walton & Co., wall decorations (Lincrusta-Walton); Alfred Walker, concrete flooring; Wortley Fire Clay Company, glazed bricks and other building materials; W. Woollams & Co., non-arsenical wall and ceiling papers.

The following exhibits in this section were not considered in competition for awards, the exhibitors being judges, or otherwise officially connected with the Exhibition:—

Mark H. Judge, architect, plans of three-room dwellings for artisans and labourers, drawing for fireplace trimmer; Dr. G. V. Poore and A. Waterhouse, A.R.A., plan for the reconstruction of University College Hospital; Edward C. Robins, F.S.A., F.R.I.B.A., designs for hospitals and schools; Professor T. Roger Smith, F.R.I.B.A., designs for hospitals; H. Saxon Snell, F.R.I.B.A., designs for charitable and parochial establishments.

Section XIV.

VENTILATING, LIGHTING, AND WARMING.

JUDGES.

H. H. Collins, F.R.I.B.A.; Captain Douglas Galton, C.B., F.R.S.; George Godwin, F.R.S., F.S.A., Ernest Hart, M.R.C.S.; Professor Kerr, F.R.I.B.A.; J. P. Seddon, F.R.I.B.A.

FIRST CLASS.

Benham & Sons, general excellence; Robert Boyle & Son, general excellence; Chorlton & Dugdale, "the Sunlight" stove; T. J. Constantine, "cooking range"; Crossley Bros., "the Otto silent gas-engine"; Frederick Dyer, hot-water apparatus; H. Renton Gibbs, general excellence; Robert H. Griffin, improved register stove; W. W. Hopkinson, "Libra lamp and valve"; S. Leoni & Co., general excellence; Longden & Co., "the Leeds stove"; Musgrave & Co., general excellence; T. Potter & Sons, "the Thermhydre" grate; G. E. Pritchett, F.S.A., architect, heating and ventilating apparatus; Radiator Range Company, "Radiator cooking-range"; Rosser & Russell, general excellence; C. R. Stevens, hot-water apparatus; Strode & Co., general excellence; Verity Bros., "air propeller," and for general excellence; T. Waller & Co., general excellence; J. Weeks & Co., general excellence; Wilson Engineering Company, cooking ranges.

AWARD OF MERIT.

Robert Adams, ventilating window apparatus; J. L. Bacon & Co., general excellence; P. Hinckes Bird, F.R.C.S., ventilators; Frank W. Clark, gas machine; Comyn, Ching, & Co., general excellence; Joseph Constantine, warming apparatus; John Drysdale, M.D., & J. W. Hayward, system of natural ventilation; Fredk. Edwards & Son, general excellence; J. E. Ellison, conical ventilators; Faraday & Son, gas appliances; J. F. Farwig, calorigen; Gilmore & Clark, ventilators; William Hellier, water heaters; Harry Hunt, "Crown Jewel" stove; C. Kite & Co., chimney top; Charles Portway & Son, "Tortoise" stove; Mrs. Priestley, window ventilator; Ritchie & Co., "Lux-Calor" apparatus; Sanitary Engineering and Ventilating Co., general excellence; Steel & Garland, general excellence; Steven Bros. & Co., general excellence; Thames Bank Iron Co., general excellence; Wm. Tonks & Son, Curtail's ventilators; the Architrave Ventilator.

Section XV.

WATER-CLOSETS, SINKS, BATHS, ETC., SEWAGE AND DRAINAGE.

JUDGES.

Professor W. H. Corfield, M.D.; Rogers Field, M. Inst. C.E.; William Eassie, C.E.; R. Thorne Thorne, M.B.; Ernest Turner, F.R.I.B.A.

FIRST CLASS.

Board, Dent, & Hellyer, "Artisan" water-closet, with flushing rim and improved joint between basin and trap; valve-closet, with flushing rim and ventilation to valve-box; cast lead S and P Traps. Birmingham Sanitary Association, Potts's Edinburgh air-chambered disconnecting trap. John Bolding & Sons, Simplex valve closet, with flushing-rim and water supply to overflow; bath, with quick waste and air vessel. H. Braithwaite & Co., syphon action waster-waste preventer. W. P. Buchan, Buchan's disconnecting drain-trap. Joseph Cliff & Sons, enamelled stoneware sinks and baths. Henry Doulton & Co., Stanford's joint for drain-pipes; "Kenon" air-chamber floor, and trap; locking waster-waste preventing bath fittings. F. Dyer, tidal valve-trap. A. Emanuel & Sons, syphon action water-waste preventer, with after flush. J. Finch & Co., Buchan's disconnecting drain-trap; "Royal" porcelain bath. Hayward, Tyler, & Co., hopper-closet, with flushing rim and trap, fitted with regulator and Chandler's waste-preventing cistern. Ingham & Sons, Stanford's joint for drain-pipes. George Jennings, automatic flushing jar, and "Dubois" drawn lead traps. Walter Macfarlane & Co., excellence of iron-work. Moule's Patent Earth Closet Co., Moule's earth closet, No. 9. J. Parker, dry earth closet, self-acting without separator. J. Purnell & Son, hopper closet with flushing rim. Shanks & Co., spray and douche baths. H. Sharp, Jones & Co., Stanford's joint for drain-pipes. Thomas Smith & Co., Herbert Jones's drain-pipe. J. Tylor & Sons, valve closet with flushing rim, and without overflow connected with valve box; flushing urinal trapped in basin; waste-not closet valve, locking water-waste preventing bath fittings. F. G. Underhay, regulator for valve closets.

AWARD OF MERIT.

A. T. Angell, air-tight covers for air chambers and inspection shafts. Beard, Dent, & Hellyer, disconnecting trap for soil-pipes; disconnecting gulley-trap, with side inlets for rain-water pipes and sink wastes; syphon action flushing cistern; "Artisan" water-closet and slop-sink, combined; square enamelled iron slop-sink; lavatory basin, with quick waste. John Bolding & Sons, "National" wash-out closet, with flushing rim; syphon-action water-waste preventer; "Champion" trap. H. Braithwaite & Co., wash-out closet, with flushing rim; Claughton's trap. Edward Brooke & Sons, stoneware ribbed pipes for sewers. W. P. Buchan, drain pipes, with rest and access lid. Capper, Son, & Co., Brian Jones's patent joint. Henry Doulton & Co., Doulton's joint for drain pipes; stoneware grease trap; Latham's balance valve drain-flap; disconnecting gully-trap, with reversible top and side inlets; Lambeth flush-out closet, with flushing rim; lipped urinal, with constant flow; "vacuum" water-waste preventer. C. W. Durham, rigid construction of house drainage. A. Emanuel & Sons, chain-action water-waste preventer, with after-flush. Eureka Concrete Company, concrete sewers in segments. J. Finch & Co., porcelain sinks for butlers. Gillow & Co., lavatories for limited space. Hayward, Tyler, & Co., urinals, with treadle action; Chandler's water-waste preventer; shower and douche bath valves. Edward Howard, Saxon Snell's automatic flushing and ventilating arrangement for water closets, &c. Ingham & Sons, balance valve flap. Brown's accessible disconnecting trap. George Jennings, lipped urinals; anti-percussion bath valves; shampooing apparatus. Washington Lyon, model of fixed disinfector, by steam. Maguire & Co., method of jointing drain pipes; clean water flush tank; disconnecting trap; Dr. Scott's disinfecting stove. Henry Owen, water-waste preventer. J. Purnell & Son, white stoneware channels; Woodward's wash-out closet, with flushing rim; syphon action water-waste preventer. Wm. Ramsey, Claughton's trap. Sanitary Engineering Company, Weaver's drain disconnecting trap; Shanks & Co., Bramah valve closet, with ventilation to valve box; wash-out closet, with flushing rim; cast-iron enamelled bath; bath fittings. C. H. Sharp & Co., water closets for ships; earth closet. H. Sharp, Jones, & Co., rock concrete tubes. The Shone Drainage, Sewerage, and Water Supply Company, pneumatic sewage ejector. Steven Brothers & Co., cast iron enamelled bath. James Stiff & Sons, Weaver's drain disconnecting trap, Weatherly single-dip disconnecting trap for sinks and waste water. T. Pridgin Teale, diagrams of defective sanitary arrangements. J. Tylor & Sons, slop sink, with galvanised top and regulator valve. John Warner & Sons, valve closet, with flushing rim and movable valve seating. Robert Weare, inodorous carbon closet commode. Wilcock & Co., disconnecting gully trough closet. James Woodward, wash-out closet basin, with flushing-rim and trap; hopper closet basin, with flushing-rim and trap; porcelain sinks for refreshment bars.

The following exhibits were not considered in competition, being invented by one of the judges:—

Bowes Scott and Read: Field's flush tank; Field's annular syphon for flushing sewers.

Section XVI.

WATER SUPPLY AND FILTRATION.

JUDGES.

Prof. François de Chaumont, M.D., F.R.S.; R. B. Grantham, M. Inst. C.E.; Professor Prestwich, F.R.S.

FIRST CLASS.

E. & J. Gardner, various forms of filters on Major Crease's (now Lieut.-Col. Crease, C.B.) patterns; also, "Carferal" filtering material; Silicated Carbon Filter Company, filtering medium and filters, with asbestos strainer; Spongy Iron Domestic Filter Company, water filters, spongy iron and prepared sand, earthenware filter-cases with late improvements; J. Tylor & Sons, waste-not valve applied in various forms for cisterns, closets, courts, and alleys.

AWARD OF MERIT.

John Bolding & Sons, workmanship of cocks and valves, specimens of workmanship in lead pipes made by Graham & Fleming; Defries & Co., blocks of pumice and granulated carbon; Henry Doulton & Co., maganous carbon filter (Bernays's patent); automatic scratign cistern filter (Bailey-Denton's); A. Emanuel & Sons, deep-well pumps, valves, and cocks; Hayward, Tyler, & Co., valves and cocks; George Jennings, drawn lead pipes by Dubois; P. A. Maignen, "Filtre Rapide," with asbestos cloth, &c.; Maguire & Co., patent renewable filter; Quirk, Barton, & Co., tin-lined lead pipes; Sanitary Engineering and Ventilation Company, cistern filters, portable filters, and table filters; G. T. Tonks, glass balls for ball valves and frictionless balance supply-valve.

THE FISH SUPPLY OF LONDON.

At the meeting of the Metropolitan Board of Works on the 5th inst., the Works Committee recommended that the Board should apply to Parliament in the next Session for power to acquire, for the purpose of a fish-market, the whole or a portion of the vacant site adjacent to the Midland Railway Company's terminus, and belonging to that company, and that the engineer and architect be instructed to prepare and submit to the Works and General Purposes Committee at their first meeting after the ensuing recess all necessary plans and estimates for that purpose. Mr. Dalton, in moving the recommendation, said the proposed site was 15 acres in extent, and was close to the Midland, Great Northern, and North-Western Railways. Good roads surrounded the land, and it was easy of access from all parts of the metropolis. A canal close to it also afforded the means of bringing up fish in boats. An amendment, moved by Mr. Selway, "That the Board do apply to Parliament in the next session for power to acquire for the purpose of a fish-market a site in the neighbourhood of the principal railway termini north of the Thames, and that the engineer and architect be instructed to prepare plans of such sites as they may consider eligible for the purpose, and submit them to the Works Committee at their first meeting after the recess," was adopted by twenty-six to nine.

The report of the Special Committee on the Fish Supply, which was submitted to the Court of Common Council on Thursday afternoon last, is a voluminous document of ten closely-printed

pages. The Committee plainly record their opinion of the absolute inefficiency of the approaches to Billingsgate Market, and, though the market has been enlarged and reconstructed, additional market accommodation is absolutely necessary. They unanimously arrive at the conclusion that one wholesale market is calculated to meet the requirements of the trade and the interests of the public, and that it should be at the waterside. There should be ample and sufficient approaches from all parts of the metropolis to the site of any wholesale fish-market. Should the Court concur in the opinion that the market should be at the waterside, they suggest two sites for consideration, — one at Blackfriars Bridge and the other by the addition of the Custom House to the site of Billingsgate. They do not recommend the St. Katharine's Docks site. If the Court should be of opinion that an inland market for railway-borne fish is also required, they suggest either a site in Farringdon-road, north of Charterhouse-street, or the site of the present Farringdon Market. There should be a wholesale, semi-wholesale, and retail market, all under one roof; with no restrictions as to hours of business.

CASES UNDER THE FACTORY ACTS.

At the Aldershot Petty Sessions on the 3rd inst., Messrs. Martin Wells & Co., builders, were summoned for employing Edward Goldring, under sixteen, more than six days in a week. Mr. Hills, on behalf of the firm, pleaded guilty, and said it was an oversight on the part of the timekeeper. Mr. W. H. Beedon, District Inspector of Factories, said there were three cases against the firm, whom he had cautioned more than once. He would, however, only enter into one. The Bench fined defendants 1*l.*, including costs.

At the Lambeth Police-court, on the 6th, Mr. John Loat, a brickmaker, Acre-lane, Brixton, appeared to several summonses for infringing various sections of the Factory Act. Mr. Redgrave said there were five summonses against the defendant, viz., for not keeping a register of the young persons in his employ, illegally employing children under thirteen after one o'clock in the day, having boys without a proper certificate, not producing the certificates of half-time, &c. Mr. Fullagar, who appeared for the defendant, said it was entirely through the ignorance of the brick-moulders of the conditions of the Act of Parliament that this had happened. *They* employed the boys really, although, of course, there was no disputing that the defendant, as the occupier of the works, was responsible. In future the moulders would be careful not to act in such a manner again. No doubt the defendant was to blame for not having kept a proper register. Mr. Redgrave said it was highly important the Act of Parliament should be carried out, and he therefore asked for penalties. He had sent papers to the defendant giving him information of what he should do, but he had taken no notice of the Act. Mr. Saunders, the magistrate, observed it was quite clear the Act of Parliament had not been carried out by the defendant, who would have to pay 25s. fine, together with 20s. costs.

CASES UNDER THE BUILDING ACT.

Mr. Charles Lavender, of The Ferns, Wimbledon, was summoned, at Worship-street, on the 3rd inst., for expenses incurred under the 47th section of the Building Act.

The complainant was Mr. Meeson, district surveyor for East Hackney, North. It appeared that the premises in question were erected, or begun, by a builder named Parker, for a merchant named Middleton. Mr. Meeson surveyed the premises from time to time, but in consequence of irregularities, and their being erected contrary to the demands of the Act, he served notices on the builder to amend them. The work not being done as required, summonses and various processes followed, fines being inflicted for non-compliance. Orders were obtained for the requisite work to be done, and after a certain lapse of time, the work not being done in the interim, the surveyor, in accordance with the Act, put the matter into the hands of a builder to see the works carried out as required by the Act. Thereby he incurred expenses amounting to 124*l.* 4s. 10d.; his own fees, travelling expenses, &c., a further sum of 29*l.* 11s. 6d.; and a sum of 5*l.* 5s. was charged as solicitor's costs for advising him as to his position under the Act, the total 159*l.* 1s. 4d., being sought to be recovered by these proceedings. The question raised by Mr. Mugliston for the defendant was whether the right person had been summoned.

The complainant proved that Mr. Lavender was trustee of Middleton's estate under the bankruptcy of the latter, and it was argued that he was therefore the "owner" of the premises within the meaning of the Act.

The Magistrate (Mr. Bartlow) decided that he had no power to make an order on the trustee in bankruptcy, and thought there had been a want of diligence on the part of the surveyor, who might earlier have sued Middleton.

A summons previously taken out against the freeholder (Mr. Button) for these expenses had also been dismissed, Mr. Hosack considering he was not owner within the meaning of the Act.

NEGLECT OF BUILDING BY-LAWS.

At the Edgware Petty Sessions, C. B. Walker, a builder, of Willesden, was charged, at the instance of the Willesden Local Board, with contravening their by-laws by neglecting to put in concrete foundations, using macadam slop in lieu of mortar, and using rotten bricks in the construction of certain houses being erected in the Melville-road, Harlesden. Mr. Tilley prosecuted on behalf of the Willesden Local Board.

The evidence showed that the builder had totally disregarded the notice of the Local Board, and the buildings were disgraceful, and would be unfit for habitation. It was also shown that the mortar in the walls smelt very strong, and contained 8½ per cent. of organic matter, animal and vegetable.

The Bench fined the defendant in the aggregate 10*l.*

The same defendant was then charged with using threatening language towards Mr. O. O. Robson, the Surveyor to the Willesden Local Board, who gave evidence in the former case.

Mr. Robson said that the defendant shook his fist in his face and threatened to do for him, and to break one of the bricks complained about over his head.

This was corroborated by Dr. Danford Thomas, the medical officer.

The defendant was then fined 20s., 8s. costs, and ordered to find two sureties of 25*l.* each to keep the peace.

"DAMP: A QUESTION."

Sir,—In answer to the question of "X.Y.Z." (p. 159), I beg to offer the opinion that the Portland cement floors, resting on a bed of clay, being highly non-conductive, remain colder than the air some time after a change to warmer temperature in the air, and consequently condense moisture from the warmer air coming in contact with their surfaces.

The correctness of this opinion may be tested by chipping off a small piece of the wet surface of the Portland cement floor, when the substance of the floor beneath the surface will be found to be perfectly dry.

If this proves to be the correct solution, then I think it will also be found more fully correct to say the floors are wet after a change to warmer weather, and dry at all other times, instead of "wet in dry weather and dry in wet weather."

Charles Drake.

COMPETITIONS.

Lancashire and Yorkshire Railway. — The directors of this company have awarded the premiums for designs for the proposed new Exchange Station, Liverpool, as under, viz.:—1st (750*l.*), Mr. John West, 4, South Parade, Manchester; 2nd (500*l.*), Mr. H. T. Percival, Old Parsonage, Newchurch, near Manchester; 3rd (250*l.*), Mr. Thomas Mitchell, 17, St. Ann's-square, Manchester.

Govan Fever Hospital.—Out of five sets of plans submitted to the committee for the proposed new Joint Fever Hospital, for the burgh of Govan, Kinning Park, and Pollockshields, that of Mr. Frank Burnett, architect, West Regent-street, Glasgow, has been accepted.

Miscellanea.

Church of Notre Dame, Bruges.—During a storm, a few days ago, the spire of the church of Notre Dame at Bruges was twice struck by lightning, displacing some bricks and destroying part of the frame of a picture in one of the chapels. This church contains a number of valuable works of art, among which may be named the triptich of Pierre Porbus; a marble group of the Virgin and Child, attributed to Michelangelo; and the tombs of Charles the Bold and his daughter Marie. All these escaped unhurt. The spire is about 435 ft. high.

The Employes of Messrs. Clark, Bannett, & Company, Limited, took their annual holiday last Saturday, the men of the London and New Cross works dining at the Royal Aquarium, Brighton; the men of the Paris works at Robinson, a village near Paris; while the men of the New York works went to Manhattan Beach. The company appear to have covered a great deal of ground that day.

A Freehold in Great Newport-street.—The award of Mr. E. R. Robson, the arbitrator in the case of the Marquis of Salisbury *v.* The Metropolitan Board of Works, heard at the Institution of Surveyors on the 5th ult., has just been published. The claimant was freeholder of the premises, No. 13, Great Newport-street, Newport Market, at present in the occupation of Mr. Limbourne, a builder, as lessee for an unexpired term of five years, at a yearly rental of 100*l.* Mr. A. J. Smith, who appeared for the claimant, said Mr. Limbourne entered into an agreement in 1876 with the marquis's agent to take the premises, and put them into a thorough state of repair, to the satisfaction of such agent, in consideration of a lease for the term of ten years, and a yearly rent of 100*l.*, but on account of the eligible character of the site, they now claimed to have the reversion capitalised at a rental of 200*l.* per annum.—Mr. Spencer Chadwick, auctioneer and surveyor, of Parliament-street, surveyor to the Marquis of Salisbury, said these premises comprised a superficial area of 1,780 ft., depth nearly 100 ft., with a frontage to Great Newport-street of 22 ft. 4 in. He estimated the present annual value of the premises at 210*l.*, and adopting the four per cent. table, was of opinion that the claimant was entitled to compensation amounting to 4,110*l.*—Mr. Limbourne (the occupier) said he expended in fulfilling the stipulated repairs a sum of 534*l.* 19s. 1d. prime cost, the builder's profit on which would have been 20 per cent. He should not mind giving 220*l.* per annum for the premises now: they were so suitable to his business, and in the midst of his customers.—On behalf of the Metropolitan Board of Works, Mr. Porter, architect and surveyor to the Sun Fire Office, said in his judgment the letting value of this property was 120*l.* per annum, which he should capitalise at five per cent. He dealt with the present rent from Midsummer, four years and a half, on the five per cent. table, and afterwards 120*l.* per annum on the five per cent. table, making 2,225*l.*, which, with 222*l.* for compulsory sale, amounted to 2,447*l.* The arbitrator has awarded the claimant 2,988*l.*

The New Tay Bridge.—At a meeting of the Dundee Town Council on the 4th inst., Mr. Buchan referred to the propriety of the Council opening negotiations with the directors of the North British Railway Company and the authorities of Perth and Newburgh, with the view of lowering the height of the new Tay Bridge from that fixed on the plans passed by Parliament. He thought this should be done in the interest and for the greater confidence and safety of the travelling public, and he moved that a special committee be appointed for this purpose. It contended that but for the non-suspension of the Standing Orders they would have had a 58 ft. 6 in. bridge, and an arrangement made between the railway company and the Perth and Newburgh authorities. It was contended by other speakers that the appointment of such a committee would do harm, as it would create an agitation which would be likely to delay the erection of the bridge, and there was no hope that it could be put up at a lower height, as both Parliament and the Board of Trade had approved of the 77 ft. height. After considerable discussion the motion was carried by 14 to 7.

The Sunday Society and the International Medical Congress.—Last Sunday by Grace the Duke of Wellington having issued invitation cards through the Committee of the Sunday Society, the foreign members of the Medical Congress visited Apsley House, for the purpose of inspecting the fine art collection and objects of historic interest which it contains. The Museum of the Royal College of Surgeons, Lincoln's Inn Fields, was also open during the afternoon to the members of the Congress. Professor Flower, one of the Society's vice-presidents kindly explaining the contents.

Another New Building for Liverpool.—The Council of the Liverpool University College, just incorporated by Royal charter, having elected 100,000*l.* for the endowment of chairs, have purchased a site for 19,000*l.* covering 13,000 square yards, on which they propose that the Liverpool Municipal Council shall erect the buildings necessary, and let the same to the on a lease of seventy-five years at a nominal rent.

A Fine Art and Industrial Exhibition and Workmen's Flower-show has just been held at Bristol. The architect appointed to plan and direct the arrangements of the various buildings was Mr. E. Henry Edwards.

The Inner Circle Railway Completion.—Once more there appears to be a fair prospect of this urgent work being carried out. A special meeting of the City Commission of Sewers was held at Guildhall on the 4th inst., to receive a communication from the chairmen of the Metropolitan and Metropolitan District Railway Companies, relative to the completion of the Inner Circle Railway, and the proposed street improvements in connexion therewith. Mr. Ashby, who presided, said at their last meeting some mention was made of street improvements that were projected in Tower-street and Eastcheap, in relation to the Inner Circle Railway, and there was a general desire that the matter should not be allowed to slumber, and that the improvements should not be lost if it could be helped. By the Act of 1879 authority was given to the Court, in conjunction with the Metropolitan Board of Works and the railway companies, to carry out the work, but no price was inserted in the statute. Various proposals were made, but they came to nothing, and finally the Metropolitan Board of Works offered to contribute 100,000*l.* towards the street improvements, and the Commission 250,000*l.* and no more; but the railway companies would not agree to those terms. In these circumstances the Lord Mayor and he (Mr. Ashby) had an interview with Sir Edward Watkin, M.P., and Mr. J. S. Forbes, the chairmen of the two companies, and the result was that those gentlemen had undertaken in writing to recommend their constituents to make the street in connexion with the railway if the contribution from the public bodies were increased from 750,000*l.* to 800,000*l.*, and in the hope that the contribution might be payable as sections to be agreed upon were completed, so as somewhat to reduce the inevitable loss of interest on outlay. Mr. George Shaw moved that the Court agreed to contribute 800,000*l.* to the proposed street improvements and new street, 60 ft. wide, in connexion with the Inner Circle Railway completion, and that it be referred to the Finance and Improvement Committee to prepare the necessary agreement, reporting thereon to the Court. This was carried unanimously.

The Sanitary Condition of Oxford Lodging-houses.—The University authorities are about to call on many of the lodging-house keepers to conform to certain sanitary requirements recommended by Mr. Griffith, C.E., whom, as we stated some time ago, they have employed to inspect every lodging-house, and they have also required those who have well-water to have it tested by the University analyst. We are told that a strong feeling of indignation has been raised in the city against the course pursued by the University, and the matter was on the 4th inst. brought before the Local Board in the form of a report from the General Purposes Committee, as follows: — "Lodging-houses.—The delegates of the University lodging-houses having issued a large number of circulars among the ratepayers of Oxford, requiring them to make many and various alterations in the sanitary arrangements of their houses, without the knowledge and authority of the Local Board, which is the only legal sanitary authority in Oxford, the committee recommend that the clerk be requested to write to the delegates, informing them that any alterations affecting the sanitary arrangements of the dwelling-houses in the district should be submitted to the Board for their approval." After some discussion, a resolution giving effect to the recommendation contained in the report was adopted.

Art in Manchester.—The governors of the Royal Manchester Institution have resolved to accept the terms offered by the Corporation with reference to the transfer to the latter body, in trust, for the use of the public, of the building and its contents. The expenditure of 4,000*l.*, annually, by the Corporation, upon works of art, is to be limited to a period of twenty years. The managing committee will consist of two-thirds members of the Corporation, and one-third representatives of the Royal Institution.

The Sale of Barnard's Inn.—Mr. Justice Fry gave judgment on Monday, according to the *City Press*, upon the demurrer of the defendants in the action of "Harvey *v.* The Principal and Antients of Barnard's Inn." The action was brought by the plaintiff to establish an alleged contract for the sale of Barnard's Inn for 50,000*l.* The defendants demurred, on the ground that the correspondence disclosed no contract. Mr. Justice Fry allowed the demurrer.

The Harvey Tercentenary Memorial.—A statue to Dr. Harvey, the discoverer of the circulation of the blood, was unveiled on Saturday last at Folkestone by Professor Owen, in the presence of a large number of the distinguished British and foreign physicians who have been attending the International Medical Congress. Harvey was a native of the town, and the memorial, which is in commemoration of the three hundredth anniversary of his birth in 1578, took its rise at the instigation of Dr. George Eastes, a member of the medical profession, at a public meeting held in the Town-hall at Folkestone, presided over by the then mayor, and at which resolutions were adopted for raising a fund for the purpose. The statue is a bronze figure, some 10 ft. or 12 ft. high, placed on a pedestal of granite, and is the work of Mr. Albert Bruce Joy.

The International Medical and Sanitary Exhibition.—This Exhibition will finally close on Saturday, August 13th. The amount of public interest which it has evoked has been very considerable indeed, as will be seen from the following statement of the number of visitors up to last Wednesday evening:—

Opening day	4,340
Total daily admissions by payment	11,973
Total number of season ticket-holders	1,729
	18,042
Estimated number of members of Medical Congress admitted free	1,500
Estimated number of Fellows and other ticket-holders of the Royal Horticultural Society admitted free	2,000
Total number of visitors from July 16 to August 10, allowing only for one visit by each season ticket-holder	21,542

Fire in a Spanish Circus.—The new circus which was erected a short time ago in Madrid for the exhibition of those popular Spanish contests, the bull-fights, was totally destroyed by fire a few days back. The structure was of extraordinary size, and could conveniently accommodate an enormous number of spectators on its seats. The fire broke out about five o'clock in the afternoon. The place was already filled with a multitude numbering 14,000 persons. The final preparations were being made for the fight, when, as the spectators were momentarily expecting the entrance of the bull and his antagonists, smoke was observed issuing from a box near the orchestra. The alarm was instantly given, and the vast assembly had all left the building within a few minutes, and without a single accident. An hour after the entire edifice was in ashes.

Art-Union of London.—The pictures selected by the prizeholders of 1881 are now on view in the new galleries, No. 112, Strand. We lately gave a list of the principal works selected, so that we need scarcely say more now than that they form a very interesting collection. We may add that any person is admitted to view the pictures on presentation of a visiting-card.

State Aid to Provincial Art and Industrial Museums.—On the order for going into Committee of Supply on the Education Estimates, on Monday evening last, Mr. Collings moved "That, in the opinion of this House, grants in aid of art and industrial museums should not be confined to London, Edinburgh, and Dublin." The amendment was lost by 85 to 48.

Employment in New York.—Our recent observations on the growth of New York has brought us inquiries from six or seven correspondents as to the prospects there for English assistants to civil engineers and architects. We cannot, however, take the responsibility of recommending any of our readers to make so long a journey on speculation.

Art Production in Germany.—The Berlin correspondent of the *Morning Post* says that the over-production of works of art in sculpture and painting proceeds in Germany at an alarming rate. The applications for admission to the annual exhibition at the Royal Academy exceed those of 1880 by one-third.

At Mobberley (near Alderley Edge) it is intended to build at once a new Wesleyan chapel, the trustees having engaged Mr. Councillor John Wills, of Derby, as their architect. The plan includes school-room and class-room, and the design adopted is Early Gothic in style.

Sir John Soane's Museum.—We are asked to mention that at a recent meeting, the Life Trustees of this institution elected as their colleague (in the terms of the Act of Parliament) Mr. George Godwin, F.R.S., to fill up the vacancy caused by the lamented death of their late co-trustee, Mr. Frederic Ouvry.

TENDERS

For new premises for Mr. S. Joseph, High-street, and Tontine-street, Folkestone. Mr. Reginald Pope, architect:—

Clemmans	£1,985 0 0

Lodge Architecture.

THE lodges which stand as the advanced guards on the approach to a house form a special class of domestic architecture, capable of a good deal of characteristic treatment and expression. At various times there have been attempts to give to them a distinctive and marked character; at other times they have subsided into the strictly utilitarian. This latter fate, however, has befallen them, chiefly at a time when house architecture on a larger scale has also been strictly utilitarian.

In general, a lodge has been considered an opportunity for some effort at prettiness on the part of the architect.

At one time there was a very general feeling in favour of rustic lodges,—a taste rather fostered by landscape-gardeners, whose ideas of the picturesque it fell in with. What is called rustic architecture, in the old landscape-gardeners' sense, however, must always be regarded as a false taste when applied to buildings for actual habitation. Its most excusable employment is, perhaps, in the formation of arbours and shelters in the midst of garden and plantation scenery, and even then the taste is a questionable one. In the application of rustic architecture to habitable lodges there is, moreover, the drawback that it almost invariably leads to the construction of an uncomfortable and somewhat unsanitary dwelling. The idea that lodges should be considered in regard not only to their appearance, but to the comfort of those who have to live in them, is, in fact, only a recent one. It used to be considered sufficient to make the lodge an attractive feature externally, and then the cutting up of the interior into habitable rooms was proceeded with as a kind of after-thought. If it were a Classic lodge, the most ingenious trickery had to be resorted to, to conceal the windows and chimneys; the thing being really a kind of architectural model into which some inhabitants were to be got somehow, in order to turn it to a useful purpose. If it were not for the comfort of the inhabitants, or if the lodge were used merely as a kind of sentry-box for an attendant to sit in during the day, it might afford a pardonable opportunity for trying a little architectural modelling and reproduction, but it is hardly fair, nor architecturally truthful, to treat a cottage dwelling, which the lodge really is, in that way.

The lodge is, in fact, an opportunity for a little rather interesting experiment in architectural expression on a small scale. It should be a kind of forecast of the architecture of the house at the entrance of whose grounds it stands. It should prepare the visitor for the general style and design of the house, and the materials of which the latter is constructed. But, at the same time, it should never look like a slice of the house cut out and stuck down at the entrance, as is sometimes the case. It must have its own scale and character distinctly marked, showing the features of the house architecture adapted to the scale of a smaller building. And it must never look like a diminutive house itself, *i.e.*, like a larger house seen on a smaller scale. There should be something piquant and unusual about its arrangement, such as would be suitable in a cottage, but not on a larger scale.

The first point in aiming at this is the treatment of the plan. The plan must not be a square or a cube, with the various sized rooms in the interior fitted in behind the walls, and with no indication of their arrangement. This is, of course, a questionable way of treating even a building of large size; but there may be something to be said for it in cases where stately and grandiose effect is especially aimed at. But this, of course, can never be achieved on a small scale. A small building, placed in a prominent position, must aim at being interesting by a certain picturesqueness and unusual character of arrangement. The lodge to a house of the ordinary size will generally consist of a living-room and one or two small bedrooms, and scullery and other offices. The arrangement of the living-room so as to separate it a little from the rest of the plan,—placing it in a semi-angular position in regard to the other block, giving it a circular or octagonal form,—such devices as these will serve to give some character to the general disposition of the little building in a way which would be quite unsuitable in a building on a larger scale, and without impairing its practical suitability as a plan. If, on the contrary, these few requisite rooms are all inclosed in one cube of brickwork or masonry, the essential character of the building as a "lodge"—an ornamental house of attendance at the gateway of the grounds,—is entirely lost; the building becomes merely a cottage, or a specimen of model dwellings for the working-classes.

This latter character it should have in one sense, however, more than it generally has. Far too often the planning and sanitary arrangements of the lodge are carried out in a rather primitive manner. All the rooms open out of each other; the living-room opens blankly on the outer air without any sort of porch or pent-house to defend it, and occasionally a lodge is assigned to married people with children, with only one bedroom, an arrangement long since condemned even for the poorest class of people's dwellings. We have met with instances of such lodge-planning as this in vicinities where it would not have been expected; but such arrangement, or want of arrangement, is very much to be deprecated. A lodge ought to be a model cottage in the sense of being a model plan; a collection of only three or four rooms planned so as to get the greatest amount of comfort and isolation of the different rooms which the available space will allow, and at the same time, so as to present a little piquancy in planning which may remove it from the category of the mere cottage, and show that there has been an intention to make it architecturally effective as well as comfortable.

What style of architectural effect the lodge should aim at ought to depend a good deal on what is the character of the house to which it stands sentry. At present there is a tendency towards a fashion for very picturesque lodges, buildings all run to roof, as one may say, and the windows stuck all over them at random. But this is really quite out of place unless the house itself is a building of the same sort, with a confusion of high irregular gables and low walls and dormers, and a generally rabbit-warren appearance. There was a set of fashion in favour of this rabbit-warren domestic architecture a few years ago, but it seems to be already declining. Experience very soon proves that the rabbit-warren style is not the best for a comfortable house, however well it may look in a picture. The style is not so architecturally unsuitable to a lodge, but if the house is built in a dignified and really architectural style, there seems no reason why the proprietor or his architect should descend to hut-building when they come to the entrance-gate.

Keeping, then, to the main style of the house as the model for the architecture of the lodge, and giving to the plan, as aforesaid, a certain piquancy of arrangement, we shall find various ways of imparting to the design the same degree of piquancy, such as the style adopted admits of. If the architecture partakes of Classic or Italian character, we may assume absolute uniformity or symmetry of design if we like, provided we are careful to give to this symmetrical design the character of elegance rather than of massiveness or dignity. But even with Classic design a little playfulness in the design of the lodge is best; a circular or semicircular porch introduced at "an odd angle," or some such feature happily treated, will take away from the serious formality which would otherwise attach itself to the style, and give an appearance of graceful irregularity. This, of course, may be much more easily done in the case of a lodge partaking more of Gothic character, where a certain degree of unsymmetrical arrangement appears quite natural and unforced. Fanciful character may be obtained, too, by reversing the usual order of things in some minor incidents of the building. In the case of lodges which are intended to be picturesque half-timbered cottage buildings, this fanciful effect has been often sought in making the upper story oversail the lower (where there

are two stories), a treatment naturally enough suggested by the treatment of street houses in many of our old towns which were originally built in half-timbered architecture. But this same treatment, making the superstructure oversail the ground story, or the surbase (if the building is in one story) may be applied to Classic design also, on a small scale, with very happy and picturesque effect. The treatment of the windows, again, influences the architectural expression of the structure. Lofty windows impart a palatial effect, low and wide windows give an expression of quietness and domesticity suitable to a small domestic building. These are indications of the manner in which special expression may be imparted to the lodge, employing the same architectural style and similar features as in the house itself, but treating or grouping them differently.

Chimneys are susceptible of a great deal of characteristic treatment in lodge architecture also, and are in this case more important objects than in larger buildings, since their actual size must be nearly the same in any case, and they are therefore much more conspicuous objects in a small building, much nearer the eye and much more important in their effect on the whole. It is, therefore, peculiarly suitable in a lodge to pay some attention to the design of the chimneys, and to endeavour to render them in a special degree an ornament to the whole instead of an eyesore. But the attempt to give more architectural importance to our lodge by adding some unnecessary feature, such as a tower or a cupola on a small scale, is not to be regarded as in any better taste in this case than in larger works of architecture. It sometimes apparently is so regarded; it is considered that in a lodge one may indulge the fancy for making ornamental architecture; but the result is only likely to look artificial and pretentious, and to excite sarcastic comments. The lodge should not be a mere piece of ornamental architecture, but a necessary adjunct treated with as much fancy and ornamental effect as its practical uses suggest and admit of.

The entrance-gate should be regarded and treated as a part of the lodge design. It is not sufficient to build gate-piers and hang between them a respectable-looking and well-constructed gate. The gate-piers should belong to the design of the lodge, and the nearer one of them, if the lodge is a one-sided one, should be closely connected with the design of the building. When a lodge on a rather larger scale is built, a fine and complete effect is produced by throwing a part of the building over the gateway, or at least roofing over the entrance and throwing a large arch across between the opposite lodges. This refers to a rather larger class of building than that which we have been suggesting, or to a double edition of such a building,—one, perhaps, used as a gardener's cottage, and it is a device only worth adopting when there is a decided intention to produce something bordering on an effect of stateliness. And where this form of entrance is adopted, we regard it as a matter of rigour that the two opposite lodges, which thus form buttresses to the gateway, should be identical in design, at all events in their general mass and size, even if small details may be varied. The employment of an arched entrance such as this between two lodges of different shape and size, as we have seen it done with a view to picturesque irregularity, is quite a mistake. The result is a lob-sided appearance, and the loss of all the effect of stateliness of approach which the use of the arched entrance is calculated to produce, and which, when the lodge buildings are on this extended scale, may be supposed to be the aim of the architect, as grace and piquancy should be his aim in dealing with the small single lodge only, which is the more usual form of entrance building.

The roofed gateway to a double lodge has the practical advantage of providing for one point of convenience which in the single lodge is often overlooked altogether. This is in regard to the fact that the main duty, or, at least, a constant duty, of the inhabitant of the lodge is to open the gate for visitors, and to close it afterwards; and the question of giving the gate-keeper some cover when he or she has constantly to go out to the gate in bad weather, is a matter worth considering, not only for personal comfort, but because, under such circumstances, the closing of the gate at least is likely to be better attended to. This is a complaint we have actually heard made,—that the entrance-gate was constantly open, because the lodge-keeper or his wife did not care to go out in the rain to close it. The lodge should be so placed and planned, therefore, that the door and porch should be close up to the gate,—a little matter of convenience often overlooked.

Considered in this way, in regard to its appropriate architectural expression and its practical convenience for its special object, an entrance-lodge affords a very good opportunity for the application of true and refined taste and common sense in architectural design, and its appropriate treatment is not a bad test of architectural ability, though on a small scale.

THE RELICS OF THE THEBAN KINGS.

Further reflection on the wonderful news from Egypt mentioned in our last number confirms our opinion of its extraordinary importance, and of the light which it throws on the general outline of Egyptian history, even before the translation of the papyri. As to the contents of these, of course, it would be idle to hazard a guess, although, since we last wrote, we have been told that the splendid papyrus in the coffin of Queen Ha-ta-su contains the ritual of the dead. Still it may commence with this, and yet include an account of the great works of the reign of this sovereign; and no doubt will tell us of the date of her death, which is as yet unknown. And it is no guess to say that the sequence of royal mummies, and presumably the papyri found with them, cover the date of the Exodus, according to any view whatever that may be taken of the chronology. It is not, therefore, being too sanguine to expect that we may shortly be presented with an account of this great historic event drawn up from the Egyptian point of view. It may be confidently anticipated that this will be very different from that taken by the sacred historian. Amenophis IV., whose mummy may probably be among those now discovered, is called in the inscriptions not only the "Pacificator of Egypt," but "the tamer of the Syrian shepherds." The dates of this king, who reigned for thirty-seven years, cover that of the Exodus, according to the most lucid account yet given of the chronology of the Pentateuch; and at all events the era of the eighteenth dynasty was one of the most magnificent periods, as regards the art of the builder, that has occurred in the history of the world.

We have further to add, as confirmatory of our view as to the cause of the alarm felt by the Egyptian priests, that we are in possession of an inscription of unusual magnitude on a granite block in Abydos. The upper half of the stone is at present wanting, but the lower part is quite legible, having been probably preserved from obliteration by having been built into some edifice in the cemetery of Abydos. The inscription is stated by Brugsch to give a general representation of the decrees of the Assyrian King, whose names and titles are completely preserved. The tablet records the visit of Shashank, king of Assyria (grandfather of the Shashank, king of Egypt, who was contemporary with the latter part of the reign of Solomon), to Thebes, and to the tomb of his son, Namurath or Nimrod (referred to in our former article), at Abydos. The king was indignant at the neglected state in which he found the temple and tomb of his son. It appears that "the Egyptian officials, who probably had little inclination for honoring the remains of an Assyrian king, had plundered, as far as they could, both the living and lifeless temple revenues which had been appointed for keeping up the grave. They were brought to an account by King Shashank, and, with the approval of the Theban god Amon, they were all punished with death" ("Egypt under the Pharaohs," vol. ii., p. 198). The inscription records the dedication of the statue of Namurath in the words, "Then his majesty had the statue, in the form of a walking man, of the Osirian great king of Assyria, the great king of kings, Namurath, brought up the river to Abydos. There were in attendance on it a large body of soldiers in many ships, no man knows their number, together with the ambassadors of the great king of Assyria. And it was set down in the splendid royal chambers of the holy of holies of the right eye of the sun, to carry the offerings on the altar-table of Nifour. According to the directions of the holy anointing, the dedication was accomplished. . . . . A memorial tablet was erected in the language of the Land of Babel, containing the command."

It will at once strike the reader familiar with the subject, that no cuneiform inscriptions corresponding with this decree have been discovered in Egypt. Nor is the explanation given by Brugsch at all unreasonable, to the effect that the Egyptians, after the departure of the Assyrian great kings, carefully destroyed all their monuments.

We thus have distinct evidence of a state of things which fully explains the fear entertained by the guardians of the tombs of the native Egyptian kings of the possible result of an Assyrian conquest. We find war actually made on the records of the dead. If the Egyptians, under the reign of Pinotem, or any of the less-known kings of the twenty-first dynasty, had actually dishonoured the temple and tomb of an Assyrian king, what more likely than the fear of reprisals on the remains of the native Egyptian sovereigns? The iconoclastic fury which disfigured such magnificent monuments as were those of the Theban kings of the eighteenth and nineteenth dynasties must have sprung from a hatred of which we see indications in this remarkably preserved inscription. It must also have been exerted by rulers of a sufficient power not to dread any popular outburst in consequence of the sacrilege. We have nothing of this kind recorded as to the accession of the Persian dynasty about 527 B.C. It is not conceivable that Cambyses would have desired to wreak his spite on the effigies of sovereigns who reigned at Thebes more than a thousand years before his day. With regard to the Assyrian kings of the twenty-second dynasty, the case was quite different. They fixed their seat at Bubastis, then for the first and only time made the capital of Egypt, no doubt with the object of keeping open the communication with their more eastern dominions. The names of these kings show their Assyrian descent,—Takelut, Tiglath, Osorkho or Sargon, Namurath or Nimrod, Shashank himself. At this time, about 930 B.C., and down to 810 B.C., there is good reason for supposing that a strong personal hatred existed between the foreign sovereigns and the priesthood, or, at all events, the personal representatives, relatives, or friends of the native dynasties. The ruthless, savage, and ferocious character of the warfare carried on by the Assyrian kings is well known. It is a record in their own inscriptions. One of the earliest dated records refers to the removal of a goddess from a temple in which she had been worshipped for more than 1,500 years. Add to this, that the special sharpness of revenge was sure to be at work, as evinced by the character of the persons accused of disrespect to the honour of Namurath. We thus have a series of indications which point very distinctly to the date of the construction of the secret gallery at Deir-el-Bahari, and to the object, as well as the occasion, of the removal to that carefully-hidden asylum of the mortal relics of the greatest sovereigns that the world has ever known. The date is fixed as to its greatest antiquity, by the presence of the relics of King Pinotem, somewhere about B.C. 1025, or of any later king who may be identified. And it is fixed, we think, no less distinctly as to its latest antiquity by the accession of the twenty-first dynasty, about B.C. 980, subject to correction from any further discoveries as to the exact dates and circumstances of the Assyrian conquest of Egypt. We thus come to a limit of forty-five years upwards and downwards, for the date of the construction and removal of the remains. No one could this have been done in a hurry. We must allow at least some six months for the excavation of the pit and gallery; and as it must have been an object with those who prepared this rock-cut sanctuary to make its existence as little known as possible, the probabilities are in favour of a considerably longer time for preparation. This may hereafter be found to agree with the period between the burial of Namurath, or rather the decree of Shashank the Elder, and the establishment of the power of Shasbank, king of Egypt, grandson of the elder Shashank, and son of Namurath. The the mutilation of the magnificent memorial statues of the Ramessid kings, and their predecessors of the eighteenth dynasty, would be indicated as a feature of the struggle, marking the predominance of the foreign invaders. It is unlikely that they would have so far outraged the religious feelings of a great mass of their new subjects after their power was established and their fury had been to some extent assuaged by the enjoyment of power. Add to this, that on the first opportunity, which we can hardly attribute to an earlier date than the accession of the twenty-third dynasty, at Tanis, about

B.C. 810, there was enough of the old national feeling dominant to lead to the careful obliteration of the inscriptions of the intrusive Assyrian dynasty, and we have a sequence of events, and a picture of human passions and sentiments, which afford a very plausible explanation of one of the *cruces* of ancient history,—the cause and the date of the mutilation of the most splendid monuments of Egypt.

INTERNATIONAL ELECTRIC EXHIBITION.

By the time that the nineteenth century had run a third of its course, the position of England as the primate of the industry of the world was established. We do not forget, although this is not the occasion to detail, what had then been done by other countries, notably by France and by America, in the ways of advancing mechanical science. But Watt, Arkwright, and Stephenson were not only representative men, but sound and honest Englishmen. Fighting, as all great benefactors of our race have had to do, against the dead-weight opposed to them, not more by ignorant than by selfish men, it was at home that their triumphs were obtained, and that, little by little, naturally, and rather in spite of, than owing to, the unintelligent action of Parliament, our vast steam factories, textile factories, railways, and steam shipping, grew to a magnitude of which it is our hope to be able to give our readers hereafter more definite ideas.

Connected with this early and autogenous growth of a new creative power was the fact that those who seized Fortune by the forelock wrought only for their own hands. Not only so, they soon began, instead of aiding, to race and to rival one another. There was no central direction, no machinery to insure the attainment by the nation of the greatest good to be derived from the welfare of the individual, no recognition of the fact that while the merchant has only to regard his relation to his fellow merchants, it is the duty of the statesman to regulate the relation of the nation to other nations, as regards its means of production and of resource, no less than its means of defence. Thus among our articles of export the very machines upon which our primacy depended formed a considerable item, the exports of machinery rising in annual value from 593 000*l.* in 1840 to 10,000,000*l.* in 1873. At the same time, our capital was freely poured out, in the shape of foreign loans, to feed the industry (or the dishonesty) of the rivals we were raising up. Our engineers for a time were much sought abroad, as more recently was the case in Japan; and there was neither disposition nor means by which a wholesome warning could be given to the nation. Our money was absorbed, our men were used, and too often ill-used. And with a rapidity which rivalled that of the spread of the railway system itself, forges, factories, mines, railways, and all the appliances of industrial science started from the soil in which we had been the first to cast the seed.

Thus we no longer hold at all events an undisputed primacy. England has not, we believe, hitherto recognised this fact. Of its truth, its magnitude, and its import, there can be but little doubt. But if anything could be calculated to bring it forcibly home to the mind of the statesman, the merchant, or the engineer, it is the fact that it is Paris, and not London, which is the scene of the International Exhibition of Electricity in the present year. It is Paris, and not London, that has first bidden the world to study, within her walls, the state of that wonderful discovery which bids fair to work even a greater industrial and physical revolution than has hitherto been accomplished by the steam-engine under all its various modes of application.

The inauguration of this important exhibition took place on the 10th of August, with all the *éclat* that could be given to it by the Government of France. The President of the Republic arrived at the scene, accompanied by ministers, in full uniform, and was received by the Minister of Posts and Telegraphs, and the President of the Exhibition Commission. The objects of the exhibition comprise even more than the wide field of the applications of electricity as a motor and illuminative power. Of this there is very much displayed. Another branch of the subject, which, as far as we have seen, has not as yet received due attention, is the application of electricity as a metallurgic and chemical power. That, no doubt will come; at present it is limited to electro-depositing. But as far as we have as yet seen, it is in the application of electricity as a means of communicating thought, and not only of sending messages by signal, by writing, or by speech, from man to man, but as echoing the voice of nature, stereotyping the indications of her meteorological action, and thus forming a wholly new and exhaustively instructive means of direct communication between nature and man, as well as between man and man, that the Exhibition of 1881 offers the most wonderful instances of the natural magic of science.

The great hall of the Palace of the Exhibition is a masonry building, 250 mètres in length by 100 mètres in width. Lofty iron pillars support a semicircular arched roof of glass; they are 8 mètres apart, and carry galleries, the spaces under which contain steam-engines, boilers, and dynamical apparatus. A set of four large Belleville boilers, which are heated by coal-dust, supply 16,000 lb. of steam per hour, or a force equal to 800-h p. nominal. There are also Otto gas-engines to the extent of 200-h.p. more. This is the provision made by the French syndicate, which supplies motor-power for a charge of 33 per cent. on the night receipts. French, English, and Belgian manufacturers have also provided many more steam-engines and gas-engines for use by private contract.

Among the English exhibitors the Brush Light Company is the first in the field. Their motor-power is supplied by seven Robey engines, having an aggregate of 137-horse power. Seventeen machines are fixed on concrete foundations, sixteen being used for illumination and one for the chemical service of electro-plating. One of the arc-light generators sustains sixteen lights, another forty, of 2,000 candle-power each; and one of the same pattern as the last, but differently applied, produces a single light of 150,000 candle-power! This is three times the power of the first-class lighthouse light contributed by the French Minister of Public Works! In addition to the above is a machine sustaining six lights of 3,000 candles each, another of six lights of 6,000 candles each, a one-light machine of 1,500, and a one-light machine of 50,000, candles.

Among incandescent lamps is a one-light machine of 3,000, and another of 50,000, candles on the Lane-Fox system, and four of 50,000 each on the Swan system. The large space under the eastern gallery is lighted by the same company with fifty-six lamps of 2,000 candles each; and the internal façade of the great hall is illumined by the same enterprising company.

The Gramme, Lontin, Siemens, Meritens, and other systems are displayed by the French Syndicate, and this part of the exhibition is remarkable for the elegance of form given to the lamps. The Edison lights occupy two *salons*, and are more particularly to be regarded as competing with gas for domestic illumination. Five hundred small incandescent lights are maintained by four small dynamo-electric machines driven by a 35-h.p. steam-engine. The greatest effort of this inventor is displayed in a combined steam-engine and generator of 150-h.p. on one bed-plate. This is to maintain 700 lamps on the great staircase, 500 more in the refreshment-rooms, 500 in one of the external gardens, and 500 in a theatre on the other side of the Champs Elysées. The weight of this monstrous development of the flint and steel of our boyhood is 17 tons. The magnets weigh between six and seven tons, and the armature, of 50 hundredweight, will make 350 revolutions in a minute. Its power is said to be adequate to maintain 1,200 lamps of 16-candle power, or 2,500 10-candle lamps.

A Siemens electrical machine, worked by an overhead conductor, is in course of erection between the Place de la Concorde and the eastern entrance of the Palace. It is intended to draw the ordinary street tram-cars by electric power. It is probable that a good scientic fight will be maintained between the advocates of this apparatus and those of the application of Faure's accumulator to the purpose of street traffic. Each of these methods, it seems to us, has its appropriate future. The erection of posts, wires, and overhead communications in a city, is, we take it, an offence against civilisation itself. For railway urban communication we have before expressed the anticipation that Mr. Siemens has a great future before him. For roadway communication, if the promises made by the *La Force et la Lumière* Company be carried out, we confess that our sympathy is with them. Forty of their 50-lb. cells are said to be capable of propelling an omnibus containing twenty-four passengers for three hours, and the cost of recharging a battery is stated to be 2½d., with the expectation of a reduction. We think that very little has yet been communicated to the public as to the secret of the Faure battery, and that a brief explanation of its principle of action will be acceptable to our readers.

In the store-cell of M. Faure, the attraction of chemical affinity is subtly balanced against mechanical force. The materials employed are, lead and that remarkable mixture of equal parts of the protoxide and sesquioxide of lead which, as first procured from a red earth occurring on the banks of that Spanish river to which the Romans gave the name of the Minius, is called Minium. This compound body is easily induced to act in a double way,—drawing in more oxygen to the under-oxidised constituent, and giving forth oxygen from its more fully oxidised element. It is here that the essential difference between the Faure battery and the Leyden battery is found. The latter, whatever its power, is instantaneously and wholly discharged when connexion is made between the poles. The latter is susceptible of gradual and controllable discharge.

The form of this battery is that of two plates of lead, each of which is coated with minium, covered with porous felt, and rolled in a spiral scroll. The two scrolls are placed side by side in a vessel of acidulated water, a strip of lead being left projecting to allow of the completion of the metallic circuit. When these strips are brought into communication with the wires of a battery, or dynamo-machine, a chemical action begins. The red lead on the plate at the positive end of the battery becomes more highly charged with oxygen, and its under-oxidised portion is converted into a peroxide. At the same time the more highly-oxidised element in the plate connected with the negative pole is reduced to the state of pure metallic unoxidised lead. This action continues until all the red lead on the one plate has been fully oxidised, when the battery is said to be charged. If the couple of leaden strips be now connected so as to form a circuit of their own, without any exciter of electricity being included, the reverse action sets in. A current of voltaic electricity is excited, and flows in the return direction, oxidising the metallic lead on the negative plate, by the oxygen which escapes from the overcharged coating of the positive plate. Thus the dynamic energy is reversed, the static chemical force is released, and a power is made available which can be gradually drawn off for the purposes of motor force. We are not aware that any good account of this delicate apparatus has been hitherto given to the public in this country, except in a short and admirable article in the July number of the *Edinburgh Review*.

THE FATAL RAILWAY COLLISION AT BLACKBURN.

It will be within the remembrance of many of our readers that, on repeated occasions, when railway inspectors and juries sitting on railway fatalities have been urgent as to the provisions of brakes that could bring a train to a standstill within comparatively a few yards, we have pointed out that a new source of danger might possibly lurk in this effort to secure greater safety. Not that we at all undervalued the importance of providing every train with an appliance which, under certain circumstances, might prevent very terrible disaster. But we foresaw that there was a dilemma to be feared, in consequence of the introduction of automatic, or very powerful, brakes. If this appliance were reserved for use in time of danger, there was the risk of its having got out of order, and thus being inapplicable when required. If, on the other hand, it were used for the ordinary working of the train, not only was there the risk of throwing an unnecessarily destructive stress both on vehicles and on the permanent way, but the possible danger incurred was even more serious, from our point of view, than the increase of cost. For the application of a brake that would bring up a train in its own length to the purpose of that gradual stoppage on nearing a station to which we have been accustomed, was hardly to be anticipated. Nor would such a use of the apparatus altogether guarantee its efficiency under stress. It was, therefore, to be feared that the engine-driver would drift into the practice of running at full speed to within a very short

distance of the stations, relying on the great brake-power to bring him up. In this case, from our point of view, a great and unnecessary risk would be incurred in the working of every line when the brakes were thus used,—a risk that would increase as the wear and tear of working rendered the appliances more liable to get out of order.

The truth of this view has been fatally proved by the catastrophe at Blackburn Station on the 8th of August. The Liverpool train reaching Blackburn at 3.6 p.m. brings a number of passengers from Scotland in a Midland composite carriage, which is detached from that train and attached to the Manchester express at that station. On the 8th, the Liverpool train duly arrived, and took up its proper place on the up-line at the further end of the station. An engine was also in waiting to shunt the composite carriage from one train to the other. All seems to have been in order, when suddenly the Manchester express dashed at full speed into the station. The accounts published all agree in the incredible statement that it was the intention of the engine-driver to stop the train by the Westinghouse brake within twenty or thirty yards of the station. We trust that it will turn out that this is a gross exaggeration. The train was approaching the station, not under steam, but under the influence of gravity. At whatever speed it was running, and wherever it was attempted to apply the brakes, the latter failed to act. According to the evidence of one passenger, there had been a jolting in the train during the journey on the former occasions on which the brakes had been applied, which indicated that something was out of order. It is quite possible that the engine-driver, standing on the foot-plate of a ponderous engine, might have been unaware of such a significant warning. But of what use are guards in running trains, if they do not call the attention of the driver to a symptom of danger of so serious a nature?

We trust that the mechanical details of the case will be fully brought out at the inquest, for which, unfortunately, there will be but too much occasion. The weight of the engine and tender, the number and weight of the carriages in the train, the speed of running, the point at which, according to the regulations of the company, it was proper to put on the brakes, should all be definitively ascertained. It should be remembered that the velocity of thirty miles an hour is equal to 44 ft. per second. We may take 166 tons as an approximate weight for train and engine. The force developed by that weight at that speed is 7,304 foot tons, and such would be the dynamical value of the blow given on a sudden stoppage of the train. To propose to effect this within the length of the train itself, except on occasions of the most urgent and obvious danger, is to incur a risk of a frightful nature. On this occasion, too, it was shown that the force of impact may be transmitted through an intermediate body, to a third body, which will then be propelled almost like a ball from a gun. The Manchester engine, striking the shunting engine, caused and inflicted such mutual damage that the two ponderous machines were locked together, and held down to the ground. But the force of the blow was transmitted to the carriage attached to the shunting engine. It is not stated whether this was coupled or not. In the former case the coupling-iron must have been broken by the shock. In any case the carriage was shot forward on the rails by the force of the blow, and propelled into the Liverpool train, of which it wrecked four of the carriages, with fatal and destructive results to numerous passengers.

The collision is one, as far as our memory may be trusted, of an unprecedented kind. The action of a single carriage as a sort of projectile has never, we think, been so frightfully illustrated. The points to which the circumstances of the case call the attention of the engineer are the effects of the difference in weight of the locomotive and the other vehicles in the train, and the importance of keeping the controlling power attached to the heaviest body in the moving mass. The short distance within which the trains of the Metropolitan Railway are brought to rest from a very rapid speed is due to the great comparative weight of the engines, and the application of brake power to this controlling weight, as well as to dragging the train. The Metropolitan engines were designed with this view. The cost of such sudden and numerous stoppages is very great, and wear and tear of engines and vehicles, as well as of permanent way, is proportionately heavy, as compared with other lines. But there was no choice for the engineer in this case. Unless the stoppages and startings could have been made almost immediate, only an omnibus rate of speed could have been obtained on the underground line. As it is, the speed between the termini is brought down to something like 12 or 14 miles an hour, while the running speed is as high as 45 miles an hour. Here, then, was a special problem, which was ably solved by the engineer of the line. But to take the mode of working which, though disadvantageous, was necessary in this particular case, and to apply it to a trunk line conveying long and heavy trains, and with stations at ordinary distances apart, is a plagiarism of an indefensible kind, likely to be attended with fatal consequences. In the present case, such consequences resulted. Whatever be the detailed replies to be elicited to the important questions that we have above indicated, this much seems sure. It was the habit on this railway to approach an important station without a proper retardation of speed, relying on the use of powerful and destructive brakes for the safety of life and limb. We do not hesitate to say that this should be directly prohibited, and that by Act of Parliament, if the power of the Board of Trade be insufficient to deal with the evil. The railway companies allege that the speed at which they travel is demanded by the public. No investigation, however, has been made on this point. Nor do we think that the public would be prepared to purchase a slight saving in time on a long journey at the cost of personal risk in approaching every station. Such a risk we pointed out as likely to occur from placing too much reliance on the brake. Unfortunately our warning has proved too true. We take the occasion of repeating it, and of accentuating the repetition by calling attention to the fact that for every 10,000 or 20,000 miles run by carriages fitted with complex brake apparatus the chance of disorder or wear in that apparatus will increase. Of course, it will increase in proportion to the number of times that stress is thrown upon the apparatus, as well as in proportion to the mileage run. Whatever precautions, then, may be necessary, in order to insure the readiness of powerful brakes to act in case of danger, their use, in the ordinary traffic, for very rapid arrest of the motion of the trains, should be altogether prohibited.

ALFRED W. MORANT, M. INST. C.E., F.S.A., F.G.S.

The death of Mr. Morant, Borough Engineer to the Corporation of Leeds, occurred about one o'clock on Thursday morning, the 28th of July, at his residence, 33, Virginia-road, Leeds. For some months his health had been in a very unsatisfactory state, when about the middle of June, availing himself of a fortnight's holiday, he visited Bridlington; returned greatly refreshed, and feeling himself equal to the task, went to Birmingham for the 7th, 8th, and 9th, to hand over to his successor the Presidency of the Association of Municipal and Sanitary Engineers and Surveyors, which he had held for the customary twelvemonth; returned home greatly fatigued; and showing symptoms of a complicated character, he became confined to his bed, where for a fortnight he patiently endured the progress of the disease, the result of an attack of diabetes about seventeen years previously, which has apparently been gradually undermining his otherwise strong constitution.

Mr. Morant was the eldest son of a second family of George Morant, of Old Bond-street and Wimpole-street, not only a highly-esteemed Decorator, during the best part of the first half of the present century, but a great encourager of art; he was, with his eldest son, George John Morant, on the first Council of the "Art-Union of London." Augustus, Alfred's younger brother, was educated to the profession of architecture, and died early in life; a notice of him appeared in our volume for 1863. Morant, born 17th May, 1828, was, after the usual school education, placed as a pupil for five years (1845-50) with the late Mr. James Simpson, past-president of the Institution of Civil Engineers, and thus was enabled to obtain thorough practical experience in such extensive undertakings as the large waterworks at Liverpool, Newcastle-on-Tyne, York, Bristol, Carlisle, and many other places, besides the Hartlepool Docks, Southend pier, &c. He then served five years (1850-55) as assistant engineer to Mr. J. G. Lynde, who was at that time engaged on Parliamentary and other work, acting for him in surveying and in charge of works, especially as resident engineer during the construction of the water-works at Great Yarmouth and at Lowestoft. They were completed in 1855. Mr. Morant was appointed, February 14, 1856, surveyor to the Corporation of Great Yarmouth, as well as to the Local Board of Health. He continued to perform the duties of the offices for about eight years, during which period he designed and carried out a Sea-wall and Marine Parade extending the entire frontage of the town, for more than two miles from north to south; developments and improvements of the general drainage system of the borough; superintending the very large Corporation estates, comprising nearly all the modern town, and also laid out for building a portion of their estate in the North Denes; he also made a detailed map of the estates, and with the Town Clerk prepared the reference-book and rent-roll, a work of great labour, but giving great satisfaction. He introduced most important improvements in the system of scavenging, road-making, repairing, watering, &c., and other official trusts. One of the first works carried out in Yarmouth by Morant was the laying-out of the new cemetery for the Cemetery Committee, together with the boundary walls, gates, &c. He was also elected surveyor to the trustees of the Children's Hospital (usually styled the Charity Trustees), for whom he made a map showing clearly their two or three hundred properties and buildings, with abuttals, &c., and to some extent developed their estates. As surveyor to the Victoria Building Company, the owners of a large tract of land at the south end of the town, acquired from the Corporation, Morant laid out the bulk of that estate, forming the roads, drainage, &c., and in some instances prepared designs for the buildings to be erected thereon, being allowed by the terms of his appointment to carry on private practice. His most important engineering work was the design and superintendence of the Britannia Pier, for a local company. This is a substantial timber structure 750 ft. in length, the head of which is 60 ft. in diameter, and in about 35 ft. depth of water and a height of about 16 ft. above high water; the general width is 24 ft.; under the head is a fishing platform. The cost, including the Act of Parliament, was about 6,000*l.*, and it was erected in about nine months, being opened in July, 1858. He carried out the completion of Britannia Terrace, a range of first-class houses facing the Parade; designed the Sailors' Home, new Record and Muniment Rooms, &c., at the Town-hall; large additions to the Great Yarmouth Workhouse; and many schools, villas, terraces, warehouse and business premises in the town and neighbourhood. With a mind peculiarly fitted by nature and study for archæological subjects, he carried out restorations to various churches, including those of Ormsby, Runham, Postwick, Witton, and Blundeston, and he also acted, until he left Yarmouth, as resident architect to the Committee for the Restoration of St. Nicholas Church, in conjunction with Mr. John P. Seddon; and he rendered valuable assistance to the late Mr. J. H. Hakewill, the architect of St. John's Church.

At the end of 1862, he was seized, whilst surveying, with the first symptoms of diabetes; this compelled him to send in his resignation, but so satisfied was the Corporation with his services, and so highly was he esteemed by the members individually, that a resolution was passed to keep open the office for a twelvemonth, the duties being performed by one of his assistants. Nevertheless, he prudently sold the extensive library of professional, antiquarian, and heraldic publications which he had collected in so great a number as eventually to require the erection of a room for their reception, and, breaking up his establishment, went over to Ireland for a thorough change, expecting to return (if at all) in a fortnight; but finding himself greatly benefited he stayed for about six weeks, seeing every place which he could reach by the railways. He then visited Norwich, when, finding his health sufficiently restored, he determined to stay there, and finally resigned his appointment at Great Yarmouth in November, 1864. In March, 1865, the Corporation at Norwich honoured him with the appointment of City Engineer, and from that time until towards the end of 1872 he was engaged in their service, performing all the duties appertaining to the office single-handed. He designed and carried out, between August, 1868, to the end of 1870, a complete system of high and low level inter-

cepting sewers, nearly all of which were built in tunnels excavated at depths varying from 20 ft. to 80 ft. below the surface. From the peculiar nature of the soil, and from the necessity of a portion of the sewers,—namely, about four and a quarter miles,—being required to be built many feet below the level of the springs, the undertaking became a work of great difficulty and hazard; the quantity of water met with in the excavations was so large that for a long time the steam-engines were pumping day and night, raising twenty million gallons per day. It was seen that the marsh land on the opposite side of the river was cracked, and on examination it was found that it was drained 9 ft. below the level of the water in the river; while also the wells were lowered, and stand-pipes, &c., had to be set up for a water supply to the inhabitants. In consequence of the failure of the contractor very shortly after the commencement of the works, Mr. Morant undertook the contractor's work on behalf of the Corporation, and it devolved upon him to employ men, purchase materials, and to personally arrange and superintend all details to the completion of the works. This entailed night service in addition to the daily duties of his other departments, at a salary of 400*l.* per annum! The sewage requirements involved the erection of a large pumping station at Trowse, at the lower end of the town, costing about 15,000*l.*, with a rising main to a farm situated on a high level at Kirby and Whitlingham, about three miles from the market-place, and consisting of 1,300 acres, of which about 100 acres were prepared by him for irrigation with the sewage. He formed a self-acting system arranged upon Bateman's "leaping weir," by which in storms the flood-waters would flow into the river. Added to these works, he had to find out all the property undrained, and to connect the various houses with the sewers. A description of this extensive and laborious undertaking was communicated to the journal *Engineering* of October 21, 1870, vol. x., pp. 297-8, through a friend who had inspected some portions of the works during progress, for Morant was always averse to putting his own merits into print; and, though often requested, could never undertake to write a scientific description of the scheme. He also acted as sanitary officer to the Board of Health, "giving his cheerful and untiring attention to the duties devolving upon him during the terrible scourge (small-pox with English cholera) in 1871." Amongst his private professional works, he designed a mausoleum for Dr. Cooper, in which that gentleman was buried in 1878, in a suit of black clothes, &c., as directed in his will.

In December, 1872, he was persuaded by his friends to compete for the office of borough engineer and surveyor to the Corporation at Leeds, the salary offered being 600*l.* per annum; this he eventually obtained. Having, therefore, necessarily to remove, he sold to the Leeds Corporation, for the newly-established city library, the bulk of the library which he had again collected at Norwich, and for which he had again built a large room, attached to the additions at first made by him to a small villa situated in Plumstead-road, outside the city, taking the remainder of the books with him to his new residence. The Sewage Works at Knostrop, designed in 1872 by Mr. Thomas Wilson, engineer to the A B C Company, in conjunction with Mr. A. M. Fowler, at that time Borough Surveyor of Leeds, had been commenced, but only included a small part of the works as now in operation. All the special fittings and appliances, so as to enable the works to be used for any of the various systems tried, the tramways, drying-sheds and machinery, offices, workmen's cottages, and the large settling-pond, were carried out by Mr. Morant, who erected at Burmantofts and Armley-road two of Fryer's patent refuse-destructors at a cost of about 4,500*l.* each. The "Minutes of the Proceedings of Municipal and Sanitary Engineers, 1876," contain Morant's "Description of the Leeds Sewage Works, and of the Various Processes which have been tried for the Purification of the Sewage," which was also published as a pamphlet of twenty pages. The systems of Drainage for Headingley and Meanwood, involving a tunnel 2,350 ft. in length, were carried out in 1877. That of Chapel Allerton, Moor Allerton, and Roundhay, Bramley, and Kirkstall required three crossings of the river Aire by inverted syphons, once over the Leeds and Liverpool Canal by a pipe bridge, and tunnelling under the Kirkstall Railway Station of the Midland Railway. The Hunslet low-level sewer required syphons under the Canal and River Aire and under the Midland Railway by a syphon. In connexion with the widening of the drainage areas, the necessity arose for larger sewers or other means of getting rid of the storm-waters. This Mr. Morant met by constructing storm overflows at all available points, and of various types; a "leaping weir" is so formed that the normal flow drops into the main sewer, but when exceptional in quantity it leaps the opening and flows down the overflow. This instance of its use, with that at Norwich, is believed to be the first in sewage works. The ventilation of sewers was strongly advocated by Mr. Morant both at Norwich and at Leeds. A few ventilators had been tried at Leeds, but great complaints were made regarding the smell. These he met by making more openings, and thus causing a greater circulation in the sewers of fresh air; the result being almost unqualified success, the complaints became few, and, when investigated, usually proved to have a local cause. In Morant's "Inaugural address," as president of the association above mentioned, he referred to the expenditure upon works affecting the health of the town amounting to 1,829,000*l.*, which he considered was money well spent, as the death-rate had considerably decreased. In one year seventeen miles of sewer works had been constructed, the total length of the sewers within the borough being then 187 miles, all of which were freely ventilated by means of open gratings and gullies, of which there are now about 20,000. At an inquiry held at Exeter a few weeks since, Mr. Robert Rawlinson, C.B., stated that "the sewers of Leeds are better ventilated than those of any town in England." The "Address" above referred to has been stated to be a most able exposition of engineering and sanitary science with reference to the departments connected with the Leeds Corporation, and was published in 1880 as a pamphlet of seventeen pages, and also in the *Leeds Mercury* of the 28th of May, 1880.

The Kirkgate Market extension, 1875—1879, consists of the fish-market, 2,200 ft. long by 50 ft. wide, with brick walls and arched iron roof, and under it a complete system of ice and fish cellars. Ninety shops in blocks of six each, a row of eleven wholesale shops, and two rows of five each, either wholesale or retail; a market for eggs and butter; an open square for garden produce; with residence and weigh-office, covered pig-market, open hay and straw market, and a new gallery with shops round the existing covered market, the whole costing about 50,000*l.* The principal street improvements carried out under Morant's directions are School-close, East-street, York-street, Domestic-street, Strut-lane, Hunslet-lane, Hunslet-road, and Swingate. He took an especial interest in the By-laws for Buildings, which had to be altered occasionally to meet the growing requirements of the borough; they were rigorously enforced. An improvement as regards paving due to him is that of making the foot-paving level with the road-paving at all crossings. He laid out and formed the roads and drainage of the Roundhay Park estate, arranging the lots for sale, erecting the lodges, &c., at a cost of at least 30,000*l.*, with later the new entrance, at a cost of 2,000*l.*; and widened, in 1872-3, the Wellington Bridge, a stone structure, originally designed by Thomas Telford, of one arch 100 ft. span, by building abutments 7 ft. in width on one side, and 14 ft. on the other; turning similar arches to that already executed, so as not to deviate from the original design, "a ticklish job," as he wrote, "the small width of 7 ft. being insufficient to give lateral stability; but I tied it in well." The bridge carrying the same road over the Leeds and Liverpool canal, was also widened at the same time; and the School Close Bridge, of brick, about 40 ft. span, partly on the skew, and springing below the water level, was carried out in 1875-76. The principal buildings are the police-stations at Sheepscar, 2,000*l.* (with branch library), Millgarth-street, Hunslet-road, 1,000*l.*; the Millgarth-street mortuary, several smaller police-stations, and plans for fire-brigade stations on various sites; with the re-plastering and decoration, with coloured tiles, for 6 ft. from the ground to all the corridors, and the granite lining to the vestibule, of the Town-hall, the original plastering having rotted from having been painted before it was dry; the ventilation of the Law Courts,—and it was by his strong recommendation, and under his superintendence, that Mr. Tobin first applied about 1874, his principle of ventilation to the police-court, effecting a thorough purification of the atmosphere without a draught, and rescuing its character from being the foulest court in England. In 1878, the large fountain he had erected in the market, was removed (1880) by him to the area in front of the Town-hall, involving the removal to one side of the area of the bronze statue of the Duke of Wellington. The central part of the fountain was first placed on rockwork, which has lately been removed, and the fountain lowered. He provided the platforms, galleries, &c., for the great Liberal demonstration of the 14th November, 1879, each to hold 1,000 persons, in a large engineering-shed, capable of holding 18,000 persons.

His latest work, and one now in progress, is the new road from Kirkstall-road to Armley. It consists of a brick and stone bridge, with two arches, each 41 ft. span and 45 ft. on the skew, over the river Aire; a viaduct of fourteen arches, each 26 ft. span; a retaining wall, 50 ft. in height, and outside a radius of 90 ft.; with an iron trussed bridge of 60 ft. span over the Leeds and Liverpool Canal. The difficulty of the work has been greatly enhanced by the great difference of 35 ft. in the levels of the river and of the canal, which are only thirty yards apart. When completed the gradients will be 1 in 32 and 1 in 77. The works are well advanced, the iron bridge being now in use. Among many of the schemes in contemplation, which had occupied his attention were,—a central fire-engine establishment and barrack, at an estimated cost of about 7,000*l.*; baths and washhouses, for about 10,000*l.*; and an abattoir; for in 1879 he attended a deputation on the occasion of its visit of inspection of those at Newcastle-on-Tyne, Berwick-upon-Tweed, Edinburgh, Dundee, Aberdeen, and Glasgow.

An anecdote, which Morant often mentioned, well illustrates his courage on an emergency. During the spring of 1879, a very cold one, he had to keep at work several hundred men in distress who were employed at small wages in road-making or anything else. One day seventy of them, being dissatified, went in a body to the town-hall and demanded to see the mayor, who deputed the borough engineer to meet them. He at once walked into their midst, asked for their spokesman, heard what they had to say, and sent them back to work. "By going right at them I got off all right, and they behaved very fairly; had I spoken from a staircase there would have been a row, but showing no fear satisfied them better." In 1877 Morant applied for a modest increase to his salary to 800*l.* per annum; and, as a proof of the high appreciation of his services and of the faithful discharge of his duties, the town council granted it without a dissentient voice.

These details of Morant's professional practice are, through the kindness of friends, the best obtainable. His varied labours, in leisure hours, in archæology and heraldry will now be described. His cousin, the late Mr. John W. Papworth, was from about 1845 engaged in the preparation of the now standard work, "The Ordinary of British Armorials." Morant, calling upon him, could not be idle, even in those early days: so while chatting, usually assisted him in cutting up and sorting the constantly-accumulating materials. Taken, or "bitten," as one may say, with the, to him, novel and interesting subject, he studied heraldry thoroughly, and taking up the severer and little known branch of foreign heraldry, prepared a "Dictionary" and an "Ordinary" on a corresponding plan, by purchasing books extensively and borrowing others relating to the subject, in the French, Italian, Spanish, German, and Dutch languages, and continued its formation up to the time of his death. Then about 1868-1871 he took Reitstap's "Armorial Général," published in 1861, a European "Burke's General Armory," and in a similar manner as done by Mr. Papworth, transposed it into a European Ordinary, as a parallel work with his first great manuscripts. These undertakings, always at the service of his friends, are comprised in a few words, but they convey no idea of the immensity of labour, care, and attention, in classification and arrangement, during a succession of years, performed by one mind without assistance. They, together with his continued entries into an interleaved copy of "Papworth's Ordinary," form a monument of industry and patient labour, and might have satisfied a reasonable person as a life's work.

Early in 1852 he translated the French text, and arranged the illustrations, for the two articles "Hipknob" and "Ridge," for the Architectural Publication Society, and to the "Dictionary" in later years he always willingly afforded the results of his experience. He drew out and published, 1854, "Sectional View of a First-rate Line-of-battle Ship with Screw Propeller." Joining the volunteer movement at its commencement, he rose to be Lieutenant of the 1st Norfolk Artillery Volunteer Corps (a Yarmouth corps), during which time he thoroughly investigated the subject of artillery, and delivered two lectures at the Corn-hall on the subject of "Ancient and Modern Guns," which were illustrated by very numerous diagrams specially prepared by himself showing the development of artillery from the earliest period. He took great pains that these illustrations, and the information given, should be accurate, and though the subject was necessarily technical, the attendances were good and the lectures highly appreciated. The corps rose to a high position, and it was with great glee and some complaint that on a certain day, practising with the great gun at a mark three miles off in the sea, it was destroyed at the first shot, and the day's duties in that respect put an end to. At Norwich, he joined the corps as an officer, and prepared and printed, in 1870, for the instruction of his men, a sheet showing the whole construction and nomenclature of a nine-pounder gun, its carriage, its limber, the shells, tubes, and line of firing. His men received high commendation from the inspecting officer at the examination following. As an enthusiastic student of Mediæval antiquities, he formed an "Archæological Chart" of Mediæval Art in England some 20 ft. long and 3 ft. wide, filled with tracings of the best examples. This was commenced at Great Yarmouth, and completed, if it could be so stated, of a work to which he was always adding, at Norwich. This gave him the foundation for a series of papers which were first printed in 1853, and enlarged and printed in 1870, in the *Architect* journal, entitled "Indications of Date"; they were reprinted as a pamphlet of forty-four pages.

After the decease of Mr. Papworth in 1870, numerous inquiries from the subscribers to his "Ordinary of British Armorials," as to the completion of that work, the printing of which had been commenced in 1857, induced a proposal from Mr. Morant to share with Mr. Wyatt Papworth in the publication of the remainder of the manuscript. This being arranged he took it in hand, and not only revised the unpublished portion of the manuscript for the press, but also added to it the materials left by Mr. Papworth, with extensive additions from the numerous sources in his own collection. This "labour of love," comprising 430 closely-printed pages, was completed faithfully and successfully in 1874. "As to giving up a thing when I once undertake it, no reasonable amount of trouble would ever make me do this," is one of the passages in an early letter on the subject, while adverting to his onerous professional duties preventing his progress being so rapid as he had desired.

Besides a large collection of tracings of constructions, and note-books for professional reference, there may be noticed amongst Morant's manuscripts and illustrated papers,—collections made by himself of monastic seals, of arms and armour, the peerages of Scotland and Ireland, Lord Mayors of London, various rolls of arms, and many other books too numerous to be more than noticed here, but proving his unremitting industry. His numerous additions to his copy of Burke's "General Armory" were gladly used in the new edition of 1879, as acknowledged by its editor and author. He has heavily noted "The Grammar of Heraldry" both with descriptions and illustrations. The "Glossary of Architecture" was even not neglected; and the last work he commenced in 1880, and was at work upon within a month of his death, was entering additional coats-of-arms into his interleaved copy of the new edition of Burke's "General Armory,"—"a very laborious job," as he himself describes it.

He occasionally complied with the wishes of local friends in preparing papers on antiquarian subjects. Among these may be named:—For the Norfolk and Norwich Archæological Society he wrote "Notices of the Church of St. Nicholas, Great Yarmouth"; communicated a paper by the late Rev. E. S. Taylor, entitled "Notice of Roman Coins and Antiquities found at Caistor-next-Yarmouth"; and, with Mr. J. L'Estrange, "Notices of the Church at Randworth." He made a plan of Skipton Castle, and from his personal examination supplied various details shown for the first time, on the occasion of the excursion in 1877 of the Yorkshire Archæological and Topographical Association; a paper "On the Abbey of Bury St. Edmund's," for the British Archæological Institution meeting in 1869 in that town; and in 1879 a paper on Kirkstall Abbey is also mentioned. He edited the third edition (1878) of Whitaker's "History and Antiquities of the Deanery of Craven," visiting all the places named, thoroughly revising the text, copying inscriptions and armorial bearings, obtaining additional information of the family genealogies, inserting additional plans and views, in a complete manner, and entirely to the satisfaction of the publisher, Mr. Dodgson, of Leeds, for whom also he edited the latest edition of the "Guide to Leeds," for 1879. He has formed a very nearly perfect collection of casts of monastic seals, and of army and navy medals, Greek and Roman coins, while many Mediæval antiquities also came within the scope of his treasures.

Mr. Morant was highly respected and esteemed in all the towns in which he had resided, not only in his official positions, but for his private worth and intellectual attainments. He thoroughly mastered the details of all the schemes and plans which he had to propose or to carry into execution. He was a good scholar in most matters antiquarian and archæological, painstaking and conscientious in his researches, most zealous in collecting information, and as ready to impart it. "As an authority in genealogical matters, on archæological buildings, and antiquarian subjects generally, he stood as one of the most eminent in Yorkshire," is the statement of one who had seen little of him, but had heard much. He was liberal to a fault, perhaps. To say he was never idle would convey a poor impression. He worked at his professional duties and for his pleasures day and night. Up at his desk by daylight, or out on his inspection duties at the water or sewage works at any time of the night, or writing during the evening and until the small hours of the morn, was his constant practice for many years. Even the partial failure of his left eye early in 1872 caused no cessation of work; the complaint of his family was, that they saw little of him unless they remained quiet in his library, where he was working surrounded by his books and papers. Even his "pleasure trips" for rest, and health, and ease to his eyes, were hurried journeys in the endeavour to see all that he could in the time. In April, 1875, to "give a few days' rest to head and eyes, which are so bad," he went to Ripon, and looked through the cathedral from the crypt upwards; next day to Studley Park and Fountains Abbey; next day over Richmond Castle and Easby Abbey; then on to Whitby, stopping there for three or four days. "You seem amused," he wrote, "at my going about sightseeing *for rest*, but can you imagine me absolutely resting? I could not do it; the change of scenery and freedom from compulsory work is the great thing." In August, having to visit the Yorkshire quarries, he visited Hartlepool, Sunderland, Durham, Newcastle, Tynemouth Priory, Warkworth Castle, Hexham, Carlisle, and back in a week. "Pretty good, was it not?" as he concludes his letter describing what he had seen. In August, 1879, he paid a visit to Yarmouth and Norwich for a real holiday, being, this time, "bent solely on quiet and fresh air," and wrote that the "visit was most delightful; I saw so many old friends who were kind beyond my expectations."

Morant was elected an Associate of the Institution of Civil Engineers on 7th February, 1854, and transferred to the class of members on 29th July, 1878; elected a member of the Geological Society in 1854; and a member of the Society of Antiquaries, 17th July, 1861. For a year he was vice-president of the Leeds Architectural Association, and, 1880 81, president of the Municipal Engineers and Surveyor's Association as above stated. He married young, and leaves a widow, three sons, and six daughters. He was buried on Monday, 1st August, in Woodhouse-lane Cemetery, at Leeds. The funeral *cortège* comprised, besides members of his family and friends, the Mayor, several of the councillors, and other gentlemen officially and socially connected with the deceased. It was met at the cemetery by nearly the whole of the members of the Corporation, members of the School Board, the Borough Coroner, officials from all the departmental offices of the Corporation, representatives of the building and other trades holding contracts under the Council, and a large number of local private friends. The coffin, which was of polished oak, was borne into the chapel and to the grave by four workmen as we understood at their own request. The tomb will be an offering from the assistants and others in his office.

WYATT PAPWORTH.

PARLIAMENT ON THE MUSEUMS.

LAST week, as we have already briefly said, there occurred one of those occasional fits of interest in matters relating to art which are not over-frequent in the House of Commons. It arose *apropos* of the consideration of the Education Estimates, in regard to which Mr. Mundella made a lengthy statement, bristling with figures and statistics. None of these, however, bore any relation to the part played by art-teaching in our educational system, and it was perhaps partly to supply this gap that Mr. Collings proceeded to call attention to the importance of rendering aids to the study of art more accessible in the provinces, and not confining the voting of public money for museums and art-galleries to the three capitals,—London, Edinburgh, and Dublin. This question of the centralisation of art-museums, and its advantages and disadvantages, is a difficult one which is every now and then brought to the front again, as one or another member for a provincial constituency is moved with the feeling of his responsibility for the artistic culture of his constituents. The general tendency of Mr. Collings's speech was in favour of making money grants on behalf of the art-museums of provincial towns, instead of leaving them to find the funds for such institutions out of their rates. The amount of public money spent on such objects in London he considered was regarded in the provinces as out of all proportion to any benefit which the provincial artisan, who might get a day or two in London once in a twelvemonth, could derive from these great Metropolitan museums, and he warned the House in somewhat solemn tones that the provincial populations would not much longer be content with the crumbs which fell from the rich table in London. He also strongly urged the appointment of a permanent Minister of Public Instruction or Minister of Education, who should supervise all such institutions, and their working and expenditure, in a broad public spirit. Mr. Slagg, seconding the proposal, dwelt also on what might be done for the provinces by means of reproductions of original objects: a method of spreading artistic education which, we need hardly remind our readers, has already been to some extent made use of by the South Kensington authorities. Mr. Ecroyd followed in support. Mr. Maskelyne deprecated the idea of voting public money for any but central museums, asking where the line was to be drawn between towns which were thus to be subsidised and those which were to be denied: a somewhat pertinent question. Mr. Caine took another line, and while strongly upholding the claims of provincial towns to greater facilities in the study of art, believed that this might be much better accomplished by a system of lending and temporary distribution of objects belonging to central museums by circulation throughout the principal local ones. He considered the British Museum should have power to lend their objects, and suggested that it was believed there were a number of Turner drawings in the National Gallery hidden away out of sight for want of space to exhibit them, which might very well be lent to some principal provincial town, such as Liverpool, where they might be very glad to have them and to exhibit them. Mr. G. Howard averred that the Turner drawings referred to were more easily accessible than was supposed,—that they were so stored as to be easily examined on proper application, and that the National Gallery authorities cultivated a liberal spirit, and had recently recommended the loan of pictures to provincial galleries. Mr. Magniac took wider ground than any previous speaker; he would prefer to see the proposition they were discussing set aside for the present, in the hope that before long a large measure of reform would be passed, and that all the three great central institutions in London would be brought under one governing head and compelled to work to one end. The first thing such a governing authority should do would be to classify all the treasures in our three museums; not to leave engravings at the British Museum and pictures at the National Gallery,

but to bring together into one building the classes of objects which had affinity to one another and threw light on each other, and which students wished to study together. He considered that when that was done we might say that we had a National Art Museum; that at present we had not. "The appointment of such a central authority would be a remedy for the state of chaos in which some of our museums were placed by bequests and gifts of objects of Classical and Mediæval antiquity, and objects of art and of natural science, which were left or presented on the condition they should all be kept in one place. Probably the objection of testators to the unnecessary dispersal of their collections would be removed if they knew that the objects they bequeathed would be distributed in suitable quarters by a responsible central authority." This, we may observe, we are by no means so sure of. People who have made a large collection of any class of valuable objects, especially if it is a collection which successive generations in a family have kept up and added to, have a natural and pardonable feeling of personal pride about it, and like, if they give it to the nation, to do so in such a way that it may be a memorial of the labour of those who collected it. We do not say they would not show a higher public spirit if they desired that the collection should be distributed so as to render the most instruction to the largest number of people; but still the other feeling is natural, and its existence must be taken into account. But this is by the way. The point of Mr. Magniac's speech (a very sensible and comprehensive one) was that when once such a general Government over the museums was appointed, the system of circulation of works by loan to the provinces, now in part carried out very usefully by the South Kensington Museum, could be further extended and made equally applicable to the National Gallery and to the British Museum, the latter of which was not only excused, but, by its constitution, absolutely debarred from lending anything out of its walls.
